The extraordinary indifference with which the Chinese contemplate death has been narrated by Mr. C. J. L. Gilson in a recent issue of the *Dublin Review*. He says that they were ever a race addicted to suicide. Criminals, we are told, are led to execution talking pleasantly with their friends. The writer knows of a case, 'of a long string of victims to be beheaded,' 'one of whom asked serenely of the executioner that he might be placed at the end of the line in order to have leisure to finish his cigarette. There, enjoying his final smoke, unmoved and scarcely interested, he witnessed the death of his comrades,' calmly awaiting his turn. How much happier will life be if the fear of death did not exist!

Asoka, the Great Buddhist Emperor.

In the course of a lengthy article on "Asoka, the Great Buddhist Emperor" in the current number of *The Buddhist Review*, after describing the state of India in the pre-Buddhist times, Mr. Zen, the writer, sketches the progress of the country after the advent of Buddhism and discourses on the numerous edicts of Asoka. He says

The system of government was an absolute monarchy, the Emperor regarding himself as the father of his people. In the Provincial Edict Asoka says —

"All men are my children, and just as for my children I desire that they should enjoy all happiness and prosperity in this world and the next, so for all men I desire the like happiness and prosperity. There are individuals who have been put in prison or to torture. You must stop all unwarranted imprisonment or torture."

Officials and learned men were summoned at stated intervals to inform the King of all measures likely to benefit humanity. This was an excellent feature of the administration of the Buddhist monarchs of India. Even aboriginal races were not exempted from the kindness and consideration of the Compassionate King. On this point Mr. Zen observes:—

This shows how vastly superior Ancient India was to Modern Europe from a moral point of view, for care for weaker races is quite a modern development in European civilisation. Too often they have been regarded merely as savage beasts to be exterminated. In the Borderers' Edict Asoka gives rules to his officials for the government of the aborigines:—

"If you ask what is the King's will concerning border tribes, I reply that my will is this concerning the borderers, that they should be convinced that the King desires them to be free from disquietude. I desire them to trust me and to be assured that the King bears them good will, and I desire that (whether to win my good will or merely to please me) they should practise the Dharma, and so gain this world and the next. Understanding this, do your duty, and inspire these folk with trust so that they may be convinced that the King is unto them even as a father, and that, as he cares for himself, so he cares for them, who are the King's children."

The writer then gives numerous quotations from the famous Chinese and Grecian travellers on the several aspects of the country and its administration. The personal care and solicitude of the sovereign for the welfare of his subjects are clearly illustrated by the many remains of the

Asokan pillars, so famous in the history of India. Thus some thirty-four Rock Edicts were inscribed in different parts of the Empire besides hundreds of pillars with various rules of life inscribed in them for the guidance of the people. Law and order were strictly enforced, so that trade and industry might prosper. The Emperor himself set the example of diligence. In Edict VI, he says

"I have arranged that at all hours and in all places—whether I am dining or in the ladies' apartments, in my bedroom or in the palace gardens—the official reporters should keep me constantly informed of the people's business, which business of the people I am ready to dispose of at any place. . . . Immediate report must be made to me at any hour and at any place, for I am never fully satisfied with my exertions and my despatch of business. Work I must for the public benefit—and the root of the matter is in exertion and despatch of business, than which nothing is more efficacious for the general welfare. And for what do I toil? For no other and than this, that I may discharge my debt to animate beings, and that while I make some happy in this world, they may in the next gain heaven. For this purpose have I caused this pious edict to be written, that it may long endure, and that my sons, grandsons, and great grandsons may strive for the public weal, though that is a difficult thing to attain, save by the utmost toil."

To live under such a King is a real boon. Mr. Zen says enthusiastically:—

Could we but ascend the river of time, and select that age of antiquity in which we would live, we would be inclined to choose the forty years, 272 to 232 B.C., when Asoka ruled in India. We may truly say of him, "a righteous man, who ruled in righteousness, the protector of his people," and the best we can wish for future social development, is that ages to come may realise the gorgeous dreams of the Indian sages, of a benevolent despot raised above his subjects by his pre-eminent virtues, ruling by force of goodness over a world of universal harmony.

The Life & Teachings of Buddha.

By the Anagarika Dharmapala. This is a clear and concise account of the Life and Teachings of Lord Buddha. Written by a well-known Buddhist authority and in a style specially intended for non-Buddhists, the book is bound to be widely circulated and appreciated. With an appendix and illustrations. Price Rs 12. To subscribers of the "Indian Review" As. 8.

G. A. Natesan & Co, Sankararaja Chetti Street, Madras

Democratic Spirit in Indian Muslims.

In the course of an article on the above subject in the *Muslim Review* for March-April, Mr. S. M. Masud Aly Khan exhorts his co-religionists in these words :—

Islam expects her sons to do their duty in whatever sphere of life they are. In order to attain prosperity, to preserve our nationality, to defend our person and property, our rights and privileges, we must introduce a hundred and one reforms. Otherwise we cannot, for a moment, entertain the idea of moulding ourselves into a powerful and respectable community of India. It is incumbent on each and every Mohammedan to realize his individual and the collective position of his co-religionists. And to do so, it is our bounden duty to prepare ourselves for the great warfare for constitutional rights that is sure to take place in the absence of activities on our part. Islam teaches us to maintain a universal brotherhood and toleration amongst the adherents and to make no distinction between low and high, rich and poor. But practically this has become simply a tradition.

He then compares the state of Muslim community with that of the great sister race—the Hindu—and advises them to follow the example of the Hindus in trying to adopt Western methods of education and organisation. The Mohammedans should try to emulate the Hindus. But in the competition there ought to be no ill-will.

As honest Mohammedans, we should equally regard with toleration their admirable virtues and exertions for the amelioration of their community in an honest and well-disciplined course. They are doing their best to see knowledge diffused in their community. They have not overlooked one of the most important branches of educational problem,—the education of their females.

In order that Muslims may rise to the full height of their manhood they should work incessantly for the amelioration of the depressed part of their society. In fifty years the result of their strenuous work will become visible. They would stand equal to the most advanced nations of the West. But to gain that end the writer says that the following suggestions should be worked out.

1. That Night Schools be opened wherever needful for such poor Mussalman boys as cannot afford to pay for education. Some well-to-do Mohammedans of the locality be asked to lend rooms for the object, and honorary teachers be deputed.

2. That District and Village Associations be started to consider the social, industrial and educational wants of the Muslims.

3. That female-education be introduced and a scheme of the same be prepared such as may involve not any great outlay.

4. That Co-operative Societies and Companies be formed for spread of arts and technical education. Night Schools be opened to impart such education to those Muslims who are otherwise well educated, but have not had the benefit of technical education. Honorary teachers be selected and deputed for the purpose.

5. That lectures on reforms be delivered on a variety of subjects. In villages lectures be given in the dialect of the villages that they may understand lectures. Lectures of all different classes may be selected, e.g., Ulemas, English educated people, men of industry and specialists who may appreciate the wants of the villagers.

6. That short pamphlets, concise and to the point, be composed by our Ulemas and others to convince the people of their religious and temporal liabilities and obligations. Such pamphlets be extensively distributed free of cost, so that they may be read by people in mosques, streets and public roads.

7. That Muslims without any personal distinction be made to attend mosques, and exchange their ideas.

8. That companies and firms be floated to start work in a consolidated form.

9. That steps be taken to ensure that no Mohammedan dies of starvation, and that each of them is made a useful member of our community.

10. That every Mohammedan be required to contribute at the rate of a pice per rupee from his income for Reform Committees.

Who Can Fathom Heredity?

In the course of an article in the *Cornhill* for May Dr. Stephen Paget writes as follows on heredity and life :—

We have got thus far, with all our talk about heredity, and no further : that we must be more scrupulous and reverent in our exercise of the awful power of parentage, and must go in more fear of reproducing, in the next generation, nothing better than ourselves, or something worse.

Imagine that he and she, in a few months' time, are to be man and wife. Each of them is aware that no act of humanity, between the cradle and the grave, is so tremendous in its consequences as the begetting and conceiving of a child. It is daily in their thoughts, it is perpetually drumming in their hearts, that they are about to exercise this irrevocable and everlasting authority of creative power. Whatever their faith may be, they cherish this one hope, that the child will be born healthy, well formed, and free from all mental taint or defect. *They are in love, they enjoy average health, they want to have children; and they find a sanction for this natural want in the assurance that they are not the first married couple to have children.* Still, they are not without wholesome fear of what may happen; and it is possible that one of them will make up his mind to read something about heredity. He will buy a large book, profusely illustrated.

This he finds useless, or worse than useless, for his high purpose. For the higher we go in the scale of life the finer become the issues,

The Rise and Decadence of Art in India.

In a vigorous article in the *Modern Review* on the condition of Art in India Mr. Arm Sen says that in the history of the art of any country we can trace the three stages of evolution, culmination and degeneration.

Thus the History of Art is a series of jagged hills one rising above the other, the summit of one being the base of another. Some time elapses before a new Art realises its ideal. As soon as this end has been reached, it begins to deteriorate, for it loses sight of its ideal as a whole, and begins to pay undue attention to details. It descends to the superfluous and wire-drawn. Thus Gothic Art fell a victim to its own over-elaboration. Now these periods with their three elements, evolution, culmination, degeneration, vary, and the times vary according to the number of forces operating.

India has gone through all these changes. There were outside chances of steady pursuit. From time to time many of the rude nomads swooped down upon the plains. Floods of barbarian invasions inundated India. Property was insecure, life itself hung on a thread, racial antipathies were stirred, society was oftentimes shaken by the tempests of Heaven and in this cataclysm of mighty forces, culture and Art fled into the sequestered grove to fade into nothingness. Even to-day obstacles to the growth of good Art are not wanting.

The obscene luxury of the rich, the killing poverty of the poor, leave no place for Art. The besotted villain on his sofa, the peasant on his bed of thorns, have not the heart to hear the soft trill of the nightingale's note, to drink in the drowsy perfumes of the rose. There is no 'patron Art.' The potential patrons live in houses moulded in the evil eclectic style of modern Europe, the propagation of which is carried on by greedy European firms. The poetry of the cupola or the dome has been lost, the mysticism of the arch forgotten in the tyranny of the Corinthian column. The houses are adorned with cheap plaster casts from Italy, casts of Jupiter and Apollo, not the eloquent bronzes representing our own gods; they have nondescript prints perpetrated in the East End of London or in the slums of Berlin. Those wondrous "flowings of line and fragments of nature" we see in Indian articles displaced by the perpetrations of Pissolli. And lastly, a false appreciation of Art has done more to degrade her than any other cause. We have rejected the seeds and accepted the tares.

In spite of such conditions prevailing in India to-day there is no need to despond. For all conditions favourable to the growth of Art are also present in India. The decentralising

forces of religion have been tempered by a wide humanitarianism. Racial antipathies have been forgotten, religious persecutions have ceased, bitterness of feeling and rancour of heart soothed. The unity of India has long been a settled fact. There is perfect harmony amongst the various elements so much so that the great trinity of Moghul Emperors employed Hindu artists and furthered Hindu tradition as ever did Hindu monarch of old. Indeed, it is from a Persian foreigner (Abul Fazl) that we get the most graceful compliment to Indian Art—"it surpasses our conceptions of things," he says. The Ajanta influence is seen clearly in Moghul Art, the Persian in Rajput Art. The modern revival is a synthesis of schools for it represents the Rajput School just as much as it does the Moghul and the Buddhist. The centrifugal forces of the same religion are being neutralised. In Hinduism the barriers of caste are breaking down in spite of the stupid clamourings of fatuous nonconformists—we have conceived the ideal of a happy fusion and are moving towards that great goal. No odium now attaches to the artists and the exalted Brahmin no longer turns his sleek countenance away from the beam-eyes of the artist. The evil dogmatism of medieval scholasticism has been exposed.

The revival of Indian Art, when such a spirit of harmony is prevalent, is sure to achieve great ends. There is in the air a visible spirit of renaissance. But the renaissance of the West is a different thing from that of the East.

A renaissance, which draws its inspiration merely from the past, is never a success. Examples abound in modern European History. The Pre-Raphaelite movement in painting was doomed to death from the beginning. It commenced with a flash and ended in smoke. William Morris has been consigned to oblivion. The possibilities of the Austro-Belgian school are limited, its emulation of the glories of Gothic Architecture is futile—the mystery of a Gothic Cathedral is out of place in modern Europe, and what inspiration can attain, steel and iron will certainly not achieve. But our modern revival is the expression of the living soul of a nation, not a mere imitation of the past. Thus religious themes appeal to us now as of old. Historical scenes bring the past before our visions, imaginative works appeal to us always. General paintings form a large part of our artistic productions. The pathos of a postman or the sensual bliss of a peasant in our Art make a universal appeal. Modern life is portrayed in its various aspects. It is not necessary for us to invent the bourgeoisie with cavalier clothes, or to crucify a peasant on a cross, and call it Art, for the poetry of modern life is still a living entity to us.

The writer concludes that our Art is a vigorous organism and is bound to grow more and more powerful. What is wanted is veneration for the artist—an apotheosis of Art.

QUESTIONS OF IMPORTANCE.

Indian Judges in the Bombay High Court.

The Bombay Presidency Association has submitted the following representation to the Chief Secretary to the Government of Bombay :—

Sir,—We are directed by the council of the Bombay Presidency Association to invite most respectfully the attention of his Excellency the Governor in Council to the following representation with reference to the appointment of judges of his Majesty's High Court of Judicature at Bombay.

2. The council venture respectfully to say that the desirability and justice of appointing natives of India to an increasing majority of higher offices has now for many years been fully recognised. As early as 1858, in the Queen's Proclamation, which is and always will be cherished by the people of this country as the great charter of India's liberties, it was solemnly laid down :—
'And it is our further will that, as far as may be, our subjects, of whatever creed, be freely and impartially admitted to offices in our service, the duties of which they may be qualified by education, ability and integrity duly to discharge.'

3. Since that memorable year when the Crown assumed the direct administration of the country, the subject has from time to time occupied the serious attention of Government, and it was with the avowed object of openly and publicly dealing with that question and with a view to settle it in a satisfactory manner that the Government of India appointed in 1886 the Public Service Commission to devise a scheme which might reasonably be hoped to do 'full justice to the claims of the natives of India to higher and more extensive employment in the public service.' That Commission went into the whole question in all its bearings with great care and thought and submitted to the Government of India its

recommendations which, though they have in more than one respect fallen short of the reasonable and legitimate aspirations of the people of this country, were substantially adopted by the Secretary of State for India in Council after mature consideration and have been regarded by natives of India as betokening to some extent the sincere desire of her Majesty's Government to abide by its avowed policy of employing the natives of India, as far as they could be employed in the higher offices of the country.

The Commission in that part of their report which deals with the appointment of judges of the High Courts refer to S. 2 of the Statute 24 and 25 Victoria, Cap. 104 (an Act for establishing High Courts of Judicature in India) which provides that judges of the High Courts at Fort William in Bengal and at the Presidencies of Madras and Bombay respectively, shall be selected from—

- (1) Barristers of not less than five years' standing, or
- (2) Members of the Covenanted Civil Service of not less than ten years' standing, and who shall also have served as zilla judges, or shall have exercised the like powers as those of a zilla judge, for at least three years of that period; or
- (3) Persons who have held judicial office not inferior to that of principal sadar amin or judge of a small cause court for a period of not less than five years; or
- (4) Persons who have been pleaders of a sadar court or High Court for a period of not less than ten years, if such pleaders of a sadar court have been admitted as pleaders of a High Court.

'Not less than one-third of the judges of such High Courts respectively, including the Chief Justice, shall be barristers, and not less than one third shall be members of the Covenanted Civil Service.'

The Commission then proceed to observe as follows:—'While, therefore, the law lays down that a minimum proportion (one-third) of the judges of the High Court at Calcutta, Madras and Bombay shall be barristers and members of the Covenanted Civil Service respectively, no proportion is specified in regard to the other classes of persons eligible for appointment, that is, judicial officers not being Covenanted Civilians and pleaders of a High Court. It is possible that no minimum proportion of appointments was allotted to persons of the latter classes because when the Statute was passed into law the measure was regarded as an experimental one, and it was felt that no guarantee existed that persons of the classes specified would be available in sufficient numbers and with sufficient qualifications to justify their appointment. But the Commission believes that the experiment has proved a success and the evidence before it supports the view that the time has come when an advance may be made in the direction of appointing to High Court judgeships a large proportion of persons who have held judicial offices or who are advocates or pleaders of the High Courts at Calcutta, Madras or Bombay. The Commission would leave to the Government to decide the extent to which advance should be made, and therefore merely recommends that in the High Courts of Calcutta, Madras and Bombay the number of judges selected from the judicial branch of the provincial service or from advocates or pleaders of the High Court should be increased. The commission has extended its recommendation to advocates of the High Courts, because it believes that the position and qualifications of persons of that class are not inferior to those of pleaders of the High Courts. The Commission referred only to the advocates and pleaders of High Court and members of the judicial branch for recruiting qualified Indians for High Court judgeships, for at that time Indian barristers in any large number

had not attained the position they occupy at the bar of the various High Courts at present.

5. The council respectfully beg to state that since the above-mentioned recommendation was made, there has been a steady and marvellous change in the general outlook and aspirations of the people of this country and the gradual evolution of their progress and advancement has been consistently maintained. It was therefore inevitable that the problem of reconciling order with progress, and efficient government with the satisfaction of aspirations which have in such large measure been fostered by British rule itself and have been generously recognised as legitimate, had to be solved, and the council gratefully acknowledge that by the new reforms promulgated in 1908 and which will ever remain associated with the names of Lord Morley and Lord Minto a great step forward has been taken in the grant of representative government to the people of India and of associating them with the Government in the daily and hourly administration of their affairs. Their demand for an ever-increasing share in the administration has been thus recognised and a liberal and statesmanlike policy has been adopted in throwing open the highest offices under the Crown to well-qualified Indians, as is evidenced by the appointment of Indians to the Executive Councils of the Governor General, of the Governors of Bombay, Madras, Bengal and other provinces, by the appointment of two Indians to the Secretary of State's Council and of an Indian to the Judicial Committee of the Privy Council, all of which have gone far to strengthen the feeling that Indians are regarded as the equal subjects of his Majesty the King-Emperor.

6. The council therefore feel confident that in making new appointments to the judgeships of the High Court of Bombay his Excellency in Council will be pleased to act in the spirit of the recommendations of the Public Service Commission above referred to and of the present liberal

policy of the Government of India by giving a favourable consideration to the claims of well-qualified natives of India to an increasing share of these appointments.

7. The council humbly beg to state that the legal abilities of the natives of India have long been recognised and that native lawyers practising in the High Court of Bombay have in the same manner as in the other presidencies won for themselves a prominent and respectable position at the bar. The council therefore submit that native lawyers qualified by education, ability and integrity are available to fill a larger number of judgeships of the High Court of Bombay and respectfully venture to hope that no considerations of race will be allowed to come in the way of the appointment of qualified Indians to judgeships in the filling of which the council submits merit and merit alone should be the determining factor.

8. The council beg to point out that the number of Indian judges in the High Courts of Calcutta and Madras respectively is proportionately larger than that in the High Court of Bombay, in Madras there being four out of a total of ten and in Calcutta six out of a total of nineteen. The Council submit that in a cosmopolitan city like Bombay with its advanced and liberal public opinion and where the relations between the various communities are so harmonious, the time has come when the number of Indian judges in the High Court which has hitherto not exceeded two out of a total of eight should now be increased. The Council therefore hope and pray that in making appointments of judges of the High Court of Bombay, the Government will be pleased to take the opportunity to appoint well-qualified natives of India from among the barristers, advocates and pleaders practising at the bar, for, whatever difficulty there may be in selecting really qualified men from the subordinate judiciary, selection from among barristers, advocates and pleaders, the Council is confident,

presents no difficulty. It is also noteworthy that while both in Bengal and Madras Indians have from time to time been appointed to high judicial and legal offices like that of the advocate-general, standing counsel, chief judge of the small cause court, chief presidency magistrate, hitherto in Bombay, no Indian has yet been appointed to any of these offices, although the council venture respectfully to say that there were available Indian lawyers who would have filled these appointments with credit and distinction.

9. In conclusion, the council respectfully pray your Excellency in Council to give the above representation your Excellency's careful attention and to forward the same to His Majesty's principal Secretary of State for India in Council, London, for his favourable consideration. The council hope to address your Excellency in Council at no distant date with regard to the other judicial and legal appointments in the Bombay Presidency, but at present have only ventured to address your Excellency with regard to the judgeships of the High Court at Bombay.

We have the honour to be

Sir,

Your most obedient servants,

PHEROZESHAH M. MEHTA,

President, and Chairman of Council.

UTTERANCES OF THE DAY.

The Bishop of Madras on "Christianity in India"

The following is the speech delivered by His Lordship the Bishop of Madras at the Annual Meeting of the Society for the Propagation of the Gospel held at the Church House, London

INDIANS AND CHRISTIANITY.

I speak to you this afternoon with a great sense of responsibility because I have a very great subject to speak about. In talking about India I am very easily conscious how difficult it is to do it anything like justice, because there can be no doubt that to-day India is awake, that in a sense it has never been awake before during all its long history. I have indeed been living and working in India nearly 30 years, and I do not think that at any time during that period I have ever been conscious of the great movements that are thrilling and throbbing in the life of India as I am to-day. Even the very unrest is a thing that makes for the spread of the Kingdom of God, because anything is better than a state of indifference and stagnation. And to day the unrest is only a symptom on the surface of the fact that, intellectually and morally, the educated classes in India are awake and alive, and it is possible to appeal to their consciences and to appeal to their hearts in a way that it has never been possible during all my experience during the last thirty years. I have been immensely struck, as you all have been, by the effect of the visit of the King and Queen. Those who witnessed the scenes at Delhi felt profoundly moved by the extraordinary devotion of the people, and there could be no doubt that our King and Queen have touched the hearts of the people of India in a quite extraordinary manner. Lately an educated Hindu told me that before the Durbar he felt afraid to go to Delhi because his ideal of kingship was so high, and he was afraid of having

it lowered. When he came back from the Durbar he told me that his experience at Delhi had enormously raised his ideal of what a King and Queen should be. And I think that the visit of our King and Queen and the effect that it has produced illustrate to us what we all have realised both in India and in England many years ago, that the people of India will respond to the touch of Christian sympathy and Christian love to quite an extraordinary extent.

ONE THING REQUIRED.

And one thing that India requires from us to-day, from us English people, is that we should approach them in a spirit of Christian humility and with real Christian affection. You have heard a good deal about this unrest and about the supposed hostility of the educated classes during the last few years. I do not think I have ever felt the friendliness and the real affection of all classes, educated and uneducated, in India so deeply as I have during the last five years. A few weeks ago I was speaking to my old colleagues of the Oxford Mission in Calcutta. They told me that during that period of unrest there had never been one single word or deed of unfriendliness on the part of Hindus educated and uneducated, among whom they live, and I felt therefore that whatever difficulties and trials the unrest may bring in the sphere of politics, it has produced an awakening of the reason and conscience that will in the long run make powerfully for the spread of the Kingdom of God.

A LEADING FEATURE.

Now there are very many subjects which I should like to address you this afternoon, but I wish first of all to impress upon you as strongly as I can the enormous opportunity that is now offered to us in India by what are called the great mass movements among the outcaste classes that have been such a leading feature of the Church's life and progress in India during the last fifty years. Some seventy years ago Dr. Duff first

began his great educational work in India. It was almost the universal opinion then among Missionaries that the Church would first capture the Brahmins and the other educated classes and then that Christianity would spread downwards to the class of the village people and the lower castes. Well now, in the providence of God, exactly the opposite has been the case. As a matter of fact during the last fifty years the Church has steadily and rapidly been spread among the very lowest classes of Hindu society, and has steadily risen from the bottom to the top. And we see in India to-day the striking illustration of that great law of God's Spiritual Kingdom by which not many mighty, not many wise, were chosen, but the weak things of world were chosen to confound the things that are strong. Let me give you one illustration of the way in which these great movements have been spread during the last fifty years. Sixty years ago there was scarcely a single Christian Indian in the Telugu country. To-day there are considerably over 300,000. This is only one of the great movements that are taking place. That same thing has happened in Travancore, Tinnevely, Ahmednagar, Nepal, and in the United Provinces among the people of Chota Nagpur, and among the Karens of Burma. Wherever the Church is working strongly and vigorously among the out-caste classes there have been converts in their thousands gathered into the Church of Christ.

THE EFFECT OF CASTE.

And the reason is simple and obvious. When we approach the Brahmins or the other educated classes, Christianity comes to them as the destroyer of their ancient civilisation; it comes to them as a great levelling force. They look upon it with alarm and dread. They do not see its re-constructive power. All that they see is that it threatens to destroy the ancient edifice which their Society and their civilisation have built up. Therefore the caste system of the Hindus and their ancient civilisa-

tion, all they are proud of in their past, are strongly enlisted in opposition to Christianity. And now, when we carry the Gospel to the out-caste it is absolutely different. As Hindus these people have been kept in a state of ignorance and poverty, miserable poverty and degradation for the last thousand years. They have been practically, and they are still, serfs to their Hindu masters. There is no hope for them whatever of rising in this world or, as they think, of any progress or advancement in the future life. Their status as Hindus is one of absolute hopelessness; and when the Church of Christ came to them, for the first time in their lives, they were met by men and women who held out to them the right hand of fellowship and offered them love and care and self-sacrifice, instead of abhorrence and contempt, and who worked unceasingly for their elevation and the improvement of their lot. What wonder, therefore, that when the Gospel of Christ came to them, it came as a real Gospel of hope and a Gospel of love? They flocked into the Church of Christ in their thousands and tens of thousands. And that process is going on still, and the fact that I wish strongly to impress upon you this afternoon is this, that there are fifty millions of these people throughout the length and breadth of India and that they are the harvest ready now to be gathered in. If the Church of Christ would attack this problem with sufficient knowledge and with sufficient devotion, it is perfectly possible to gather into the Church of Christ the whole of these fifty millions of people within the next fifty years. I am not exaggerating when I say that at the present moment it is simply a question, humanly speaking, of men and money, how many thousands of these people are gathered into the Church in the Telugu Mission or any other Mission throughout India.

I am well aware that there are a certain number of people who would doubt whether it would be a wise policy of the Church to press on

Indians in America

Mr. Dhan Gopal Mukerjee writing from Berkly, University of California, U. S. A. says that *Indians are quite welcome there to study any subject but that they are prohibited from being labourers or clerks.* He writes:—

"As regards the immigration of labourers, the only reply I could give is an emphatic "no." If Hindusthan is made odious in this country by any one, it is the kind of labour India sends here. These men without culture, without self-respect, without adaptability, that keynote to the success in life, will drag us down to the abyss, to the verge of which they have already brought us. They first of all lower the standard of wages which poisons American labour against them; secondly, their unhygienic mode of living, their aloofness from the American life, and last of all their mode of dress so conspicuously hateful to an American, are the great obstacles in their way in coming to this country. The whole thing can be summed up in one phrase: "the lack of adaptability." If they can only adapt themselves to the life here they are perfectly welcome. If not, we beseech them not to come here and drag even the students to the position where they are now. The name "Hindu" stings like a white hot brand. Why? For our labourers have made it so. Lastly, the American Government have already prohibited Hindu immigration. So, if any man comes specially to the Pacific Coast, he will be sent back, which means a loss of great amount of money and time. Supposing he is to be allowed to land on the Atlantic Coast, let him remember, that Coast too is crowded with European immigrants; so, to land on that Coast means starvation or suicide. Any man who wants to study is welcome to this country. Any educated man, who wants to earn a living as a clerk or pursue any profession of that kind would be badly disappointed at his arrival here. No money making tendency will find any scope.

British Indians in the Transvaal.

Mr. Morrell asked the Secretary of State for the Colonies whether his attention had been called to the action taken by the municipality of Germiston, in South Africa, in giving to a village of Indians established near the town a month's notice to quit the site which they now occupy in order to move them to a new location; whether he was aware that part of the site offered to them by the municipality had been used until recently as a dumping ground for nightsoil and a cemetery for dead horses; that a dumping ground for slop water was quite near it; that the stench pervading the atmosphere was intolerable, and that the site was in every way unsuitable for the dwellings of human beings; and what steps he proposed to take to see that the rights of this Indian community were respected.

Mr. Harcourt: I have no official information on the subject, but, according to the Press, the Germiston municipal location was held by the municipality on lease from a mining company, one condition of the lease being that the lessees should have no trading rights in the location the lessors reserving to themselves four stands for trading purposes. A number of Indian traders recently having obtained trading licences the municipality determined to give notice to all holders of stands that, unless they agreed to an endorsement that the stands were for residential purposes only they would be given notice to quit. Some of the Indians have, I am informed, petitioned the Germiston Council against the new location.

Mr. Morrell: As this matter involves great hardship, will the right Hon. Gentleman communicate with the South African Government on the matter.

Mr. Harcourt: I am afraid that I cannot add anything to the information which I have given. I have given all the information which I possess.

Mr. Moore: Does a strong supremacy of this Parliament apply there?

FEUDATORY INDIA.

Mysore Economic Conference.

The Agricultural Committee of the Mysore Economic Conference dealt with the six of ten subjects allotted to them during the past eleven months. (1) In regard to the indebtedness of the Mysore ryot and his general economic condition a general outline of enquiry has been framed but in view of the labour involved in collecting village statistics the Committee recommended appointment of a full time officer for work for the year. (2) Determining fresh sources of revenue occupied the Committee largely. They obtained statements of assessed waste lands which are of importance as showing the extensive scope there is for increased cultivation and introduction of improved methods of agriculture. Before putting forward any definite schemes the Committee intend to more thoroughly thresh out the subject and ascertain how best an appreciable portion of these lands now lying waste can be brought under the plough. (3) The Committee have made a beginning in the formation of an agricultural library. (4) The proceedings of their monthly meetings have been translated into Kanarese and distributed to the ryots. (5) They attach great importance to the Co-operative movement and have resolved to meet (a) the cost of publishing bulletins on the subject (b) to appoint an English and Kanarese lecturer and to grant Rs. 500 this year to meet the cost of District Co-operative Conferences. (6) A beginning has been made in the direction of starting nurseries in State forests for the supply of seedlings to the ryots, the Conservator of Forests and the Government Botanist co-operating. The former has already begun to grow Algerian oats. (7) There is an acute difference of opinion in regard to the advisability of using special fertilizers, but the Committee are keeping an open

mind on the subject. (8) With a view to disseminating information on agricultural matters and the co-operative movement the services of capable non-official gentlemen will be utilized on payment of travelling expenses. (9) To encourage special crops such as mulberry and fruit culture the Committee have offered scholarships to deserving sons of the ryots. (10) The Committee have given grants ranging from Rs. 70 to Rs. 250 to five district agricultural associations. The amount is determined by the annual subscriptions of each body subject to a maximum of Rs. 250. (11) The Mysore silk being pronounced best in India by the London and Paris experts the Committee allotted fourteen scholarships for the training of the sons of the ryots in sericulture at the Tata's farm now being worked by the Salvation Army. Colonel Booth Tucker's pamphlet on silk was circulated during the year. (12) A scheme for training students in horticulture at Lal Bag, Bangalore, with fourteen scholarships is making good progress. (13) A portable oil-engine, a pump for demonstration purposes all over the province is being purchased at a cost of Rs. 5,000. (14) A costly trench plough is being demonstrated at the Chitaldrug district. The Agricultural Committee is composed of three officials and seven non-officials, gentlemen of varied experience who are thoroughly conversant with the needs of the country. Much time was taken up in the settlement of preliminaries but their course has been chalked out, the underlying principle of the Conference being to associate prominent State Officers, some of leading citizens, for purposes of continuous deliberation. The Committee realise that considerable interest has been aroused and that tangible results may be expected in four or five years.

Education in Baroda.

On May 13, Mr. Watt asked the Under Secretary of State for India: Whether free and compulsory elementary education is given in the district of Baroda; if so, for how long has that system been in vogue; how is the cost of it met; have the results been satisfactory; and is his department prepared to recommend a similar scheme experimentally in any of the neighbouring districts.

Mr. Montagu: Baroda is a Native State under the suzerainty of His Majesty, not a "district." Compulsory free education was introduced into all districts of the State in 1905-1908. The cost is met from the revenues of the State. An Education Commission appointed by H. H. the Gaekwar in 1909 was of opinion that compulsion was, to some extent, successful. The Chief Minister of the State, reviewing last year's work, said that "while it is by no means an assured success, it is a praiseworthy attempt, with an excellent chance of final success, if money is freely spent and vigilance ceaselessly exercised." Of the children enrolled, however, only sixty-one per cent. actually attended school, as compared with 77.6 per cent. in British India, and the fines for non-attendance amounted to Rs. 55,000, which means an incidence per head of population double that of the incidence of fines in British India. There is no present intention of acting on my honourable friend's suggestion, and I would refer him to the debates on the subject in the Viceroy's Legislative Council.

A Cottage Industry in Baroda

The Baroda Brush Factory, Ltd., has started work and turns out various kinds of brushes. It is interesting to note that brush-making in this State is worked as a cottage industry. The backs of brushes and bunches of hair and fibres are provided to the village women, who work in their own homes and return the finished brushes, being paid on the piece work-system.

Agricultural Banks in Mysore.

According to the Government of Mysore, "the condition of the Agricultural Banks, with scarcely any exception is unsatisfactory." There were nine of these banks working at the beginning of the official year, and nine at the close of the year. The total registered funds of all the banks amounted to Rs. 2,64,385; but the balance of Government-loan amounting to Rs. 31,638 outstanding against the banks continued to be the main source of capital for them. Supplemented by deposits from members to the extent of Rs. 4,951, the capital available amounted to, say, Rs. 36,600, or an average of only Rs. 4,070 for each bank. The total receipts were Rs. 27,134, the disbursements Rs. 26,172; the closing balance of all the banks together amounted to Rs. 1,545—an average of Rs. 172 per bank! A sum of Rs. 8,478 was lent to members during the year, while Rs. 15,284 was recovered. "The number and volume of the transactions of all the banks continue decreasing, as no attempt is anywhere made to replace by fresh capital, the annual repayments of the Installments of the Government loans." Compared with the small figures quoted above is a sum of Rs. 2,55,080, which is given as "the total estimated value of the property hypothecated to the working banks." The main source of this income was the interest realised on loans granted to members and the total income thus realised was Rs. 2,548 "which was mostly utilised for paying the interest due on the Government loan and for meeting the establishment and contingent charges." All the Banks are said to appear to be in a solvent condition, quite apart from the guarantees already mentioned. But all the banks, even those working best, are said to be in their last stage of life and evince little vitality.

INDUSTRIAL AND COMMERCIAL SECTION.

Indian Railways.

A question of financial policy of the greatest practical interest is raised by a paper on "Indian Railways," read a few days ago before the Indian Section of the Royal Society of Arts by Mr. Neville Priestley, managing director of the South Indian Railway. In brief, Mr. Priestley's criticism of the policy pursued by the Indian Government in the matter of railway development by branch lines amounts to this: that it has set so high and expensive a standard in the matter of construction that an adequate remuneration of the capital investment can only ensue after a long lapse of years, during which the material and moral development of the country is delayed. With less expensively constructed railways, he contends, the country would be opened up very much more rapidly and the necessary capital procured in ungrudging amounts. Mr. Priestley first details the history of the financing of the Indian main lines and certain branch lines, after 1845 by private enterprise with a Government guarantee, after 1869 by State enterprise with money raised by loans or from surplus revenues, after 1876 by private enterprise and Government guarantee again, and finally after 1893 by private enterprise without guarantee, but under a system of conditional subsidy known as the "Rebate Terms." He then proceeds.—

"That the country needs every penny of the 12½ millions sterling which Sir James Mackay's (now Lord Inchcape's) committee considered that it should be given, is very clearly demonstrated by the reports of congestion on railways which come home from India by every mail, and the clamorous demands for more new lines from all parts of the country. That the Secretary of State has real difficulty in providing so large a sum from the resources at his disposal

is also very clearly demonstrated by the reception given to the recent three and a-half per cent. India loan of £ 3,000,000. The issue price was fixed as low as 93 per cent., and yet only 15 per cent. of the loan was subscribed by the public.

"With evidence such as this before him, it is perhaps not surprising that the Secretary of State hesitates to go to the market for large sums of money; but the demand for funds for railways must be none the less met, if the progress of the country is not to be arrested; and a further attempt was, therefore, made in June, 1910, to try and induce private unguaranteed companies to undertake the construction of new railways, by again revising the branch line terms. It will thus be seen that the railway financial policy of the Government of India has been one constant see-saw; that their best intentions have been frustrated at one time by famine, at another time by war, at another time again by currency difficulties, at another time by political considerations, and at all times by the state of the Money Market; and that at the end of 60 years the position is that only 33,100 miles of railway have been constructed altogether in a country whose area is 1,773,168 square miles, whose population is over 300 millions, and the development of whose trade, indeed, of the country itself, is being hampered, and badly hampered, by the want of adequate facilities. Of these 33,100 miles of railway, the State has itself had to build about 26,000 miles, either directly or through companies under its guarantee; only 1,573 miles have been constructed by companies without a Government guarantee and only 1,139 miles by companies under the rebate terms. In other words, the conditions governing the provision of funds without a State guarantee have not had the effect of attracting the investing public, and Government have been obliged to find practically all the money required for railway purposes in India."

The Hand-Loom in India

The following extract from the report furnished to the Trustees of the Wadia Charities, Bombay, by Mr. N. M. Joshi, of the Servants of India Society, gives an account of the hand-loom industry prevailing among the Dheds community of Dohad, one of the eastern talukas of the Panch Mahals and next in importance and extent to Godhra —

Another class of people in this taluka, to wit the Dheds, a class of untouchables who are the weavers of this district, need our attention. They prepare rough white cloth generally used by the local Bhils. The cloth, which is very coarse, consists of *pasodas* and turbans. As the Bhils are unable this year to buy new clothing these weavers find no customers for their goods. The Banias do not give them the full normal price for their cloth as they in their turn do not expect to sell their goods this year. So many of these Dheds have to find out some other work for maintenance. But as this is an important artisan class in the taluka and as it is not in the interest of society in general that such a useful industry should be ruined for want of supports, I think something must be done to help these people.

From the inquiries that I have made I am convinced that some years back the number of the Dheds who engaged themselves in the weaving industry was very much larger than what we find now. From being artisans they are gradually being degraded to the class of the labourers. When I entered the houses of these people in the Kalol Taluka I saw some old looms kept in a corner unused for several years. The neglect into which they have fallen is mostly due to their being untouchable. The village and the subordinate revenue officers not only will not enter their houses but consider it a pollution if they enter that part of the village where the untouchables live. When I questioned some Talukda and circle-inspectors in this connection they seemed not to know even of the existence of any looms worked by

these people in the villages in their charge. The only way of helping these weavers during this year is to find a customer for the goods they prepare. I have suggested to the Local Famine Relief Committee at Dohad to purchase the clothing that they may buy out of the grant received from the Bombay Central Relief Committee from the local weavers, and the members have agreed to my proposal. The Bombay Depressed Classes Mission Society might make more detailed inquiries in this connection.

The Mineral Wealth of India

Sir Thomas Holland, in the course of an interesting article on the subject of India's mineral wealth contributed to *Commerce*, says: The mineral of greatest value to the country is manganese. Thirteen years ago, India produced no manganese ore at all. This year the output will not be exceeded by more than one or two of the twenty countries that contribute to the world's supply. Manganese mining may thus be looked upon as a successful new industry, one that helps to swell the table of total values, and to give an impression of industrial expansion. It is better that manganese ore should be raised for export than be allowed to lie idle in the ground; but this country (India) receives no more than fifteen out of the thirty rupees that a ton of manganese ore is worth at an American or European port. We thus not only lose half the value of the mineral, but have to pay again for the metal it contains in the large imports of steel, for which India is still practically dependent on Europe. The same thing has now commenced in connection with the chrome iron ore. To the miner the chrome-ore is worth about 23s. a ton whilst the European manufacturer pays 75s. for it. Until iron and steel are manufactured on a large scale in India, we have to submit either to this imperfectly compensated drain of the mineral resources or the still less profitable alternative of allowing the minerals to lie undeveloped.

Jail Industries.

The Government of India have issued the following circular to provincial Governments and others under date 29th April :—In a Home Department letter, No. 151-160, Local Governments were requested to give their opinions on the subject of the regulation of jail industries in British India with special reference to their competition with similar industries carried on by private enterprise. From the replies received the Government of India are satisfied that the general principles laid down in the Home Department resolution, No. 10-605-18, dated the 7th May, 1886, require no modification and they have no fresh orders to communicate on the subject. Local Governments and administrations should therefore, as before adapt their intramural industries as much as possible to the requirements of the public consuming departments and the Government of India will only interfere if, on complaint made, any jail is found to be catering for the public in such a manner as seriously to injure any local trade. Local Governments and administrations will do well to keep this principle specially in mind as any infringement of it is more likely to be challenged now than was the case 15 years ago when it was enunciated.

There is, however, one point in which an advance on the arrangements sanctioned in 1886 appears to the Government of India to be possible. It was then laid down that jails should supply the public consuming departments but no particular departments were indicated. From the present correspondence, it would appear that the bulk of the articles manufactured in jails are consumed by the departments working under the orders of Local Governments. The Government of India consider that this arrangement is suitable as making for decentralisation and thus minimising friction and should be developed. In future, therefore, before calling on the imperial consuming departments to take all products, the Government

of India will require to be satisfied that provincial possibilities have been exhausted. It will, of course, remain open to local jail authorities to arrange locally and on a voluntary basis with the imperial consuming departments for contracts on the present system and the Government of India desire no change in this respect, but if this is found impracticable and if the demands of the provincial departments do not come up to the full capabilities of the jail supply, then the circumstances of the jail or jails in question should be laid before the Government of India for the issue of such instructions to an imperial department as may appear to be proper.

Japanese Trade in India.

A Tokyo correspondent records that the Japanese spinners' Association recently despatched a representative to India to report on the conditions of trade in that country. His report has now appeared in the vernacular press, and makes interesting reading, the more so as the representative is himself the head of a large spinning mill in Japan. He first expresses great surprise at the simplicity of living in India, where a population of 300,000,000 consume only 2s. worth of cotton fabrics per head per annum and only 2½d. worth of silk fabrics. He considers that the business methods at the factories, the arrangement of machinery, and so forth are all most unsatisfactory. Only the buildings and the machines are good. The workmen are idle, and, he thinks, management is entirely lacking. The volume of production per operative is only half of that of a Japanese mill. As India is mainly an agricultural country, most manufactured goods have to be imported. There should, therefore, in the Japanese spinner's view, be no difficulty at all in "redressing the adverse trade balance" as between India and Japan of 50-55,000,000 yen annually by developing the export to India of Japanese silk and cotton fabrics.

Experiments in Electroculture.

Some interesting experiments in electroculture, which were conducted at Dablen, Germany, have been described in a recent official report published in Berlin. A certain number of plants including spinach, radish, cabbage and lettuce, were adopted as standards, for the purpose of comparison. These were not artificially electrified, but, on the other hand, were not shielded in any way from the normal electricity of the atmosphere, which is found to be an important factor in plant growth. The growth of these "control" plants was rated as 100 per cent. Another group of similar plants was exposed to intensified atmospheric electricity by means of currents on an overhead wire. These showed an increase of yield amounting to from 15 to 40 per cent. A third group was treated with artificial high tension electricity (direct current). With a strong current, the yield varied between 90 and 105 per cent, i.e., it averaged below the normal. With a weak current it was from 100 to 125 per cent, i.e., on an average considerably above normal. In a fourth group, comprising only dwarf French beans, the plants were covered with a wire cage, arranged to exclude the natural electricity of the atmosphere. These showed a yield of only 86.5 per cent, i.e., they were decidedly below normal. It is found that applications of electricity should not be made during hot sunshine. In summer, early morning and evening are best; in spring and autumn 7-30 to 9-30 a.m., and for two hours before dusk, in winter only in the morning from 9-30 to 11-30.

Applications during rain are useless, but, on the other hand foggy weather is most favourable. Unmistakable success has, according to the report in question, been achieved in hastening the ripening of strawberries by several days, thus enabling the growers to command the highest prices at the beginning of the season.

An Indian representative in the International Institute of Agriculture.

The Secretary of State has selected Sir Edward Buck to attend as a representative of India, the Meeting of the Permanent Committee of the International Institute of Agriculture at Rome, to be held there in August next, and also the Meeting of the General Assembly, with the preliminary Meetings of the Permanent Committee to be held in the spring of 1913.

Ammonia from the Atmosphere.

In a lecture at the Royal Institution, London, on April 18th, Professor Arthur W. Crossley maintained that from a scientific point of view the problem of preparing ammonia and other nitrogenous products from the atmosphere on a large scale had been satisfactorily solved. He had been convinced of this by a careful inspection of the works in operation in Norway, which are the largest of the kind in the world. It was becoming increasingly difficult to procure the nitrogenous nutriment necessary for plant life. The prospect of being able to extract the nitrates and ammonia compounds needful for agricultures from the air was full of encouragement for the future. Professor Crossley predicted that through this invention Germany will in a few years not only produce all her wheat that she needs but will have a surplus to export.

A Cotton Experimental farm.

Aligarh, as the centre of an area which annually grows about 750,000 acres of cotton, has been selected for the location of a cotton experimental farm, which is now engaged in studying the types of cotton cultivated in the surrounding districts. It appears that over the whole tract one species of cotton is cultivated, viz, *Gossypium neglectum*, but four different types of this species are easily noticeable in most cotton fields, differing in the colour of the flower and the form of the leaf.

Departmental Reviews and Notes.

LITERARY.

REALISM v. ROMANCE.

In the *Cornhill* for May Mr. A. O. Benson writes on realism in fiction. He says:—

The old inclination of tellers of tales, obeying no doubt a similar inclination on the part of listeners, was to brush aside all the vulgar, obvious and commonplace elements of life, to represent character at its highest and most heroic, and at the same time, in order to make the background darker and blacker by way of contrast, to intensify the uglier and more evil elements, that the nobler types of temperament might be more radiantly and emphatically outlined.

That was what romance, developing and broadening out of epic, tried to do. But imaginative writers in these later days have wearied of all that. They have begun to perceive that life itself is far more wonderful and abundant than any arbitrary reconstruction of it; that the interest of life lies in the very fact that we cannot, as the poet says, "remould it nearer to our heart's desire"—but that it is an infinitely mysterious and complex thing, which we can only criticise by studying; and that we must not be afraid of looking closely at its baser sides, its failures, its contradictions; because it is in them that the very secret of life lies. The imaginative spirit has grown to perceive that truth is a far more interesting thing than any private fancy, and it has learned, too, that the imaginative faculty can be just as nobly used in selection and firm representation as it was used in discarding and remodelling.

It is this then that we call Realism.

LITERATURE, A SOCIAL POWER.

Literature, especially in the form of fiction is becoming a more potent social power as it becomes less literary. The matter more and more determines style, and the presentment is more natural,

Reality in fiction, not only secures naturalness of character, situation, and action, but implies imaginative creation.

Modern fiction of this order is a dealing with souls, not so much seriously as sincerely, and has little leisure for the portrayal of costumes and masks. Its originality is not striking through peculiarities, idiosyncrasies, or those casual earmarks of dramatic characterisation which Dickens so freely emphasised; it is rather the originality of the commonplace made significant.

Its humour is inseparable from its creative realism, subdued to the natural tone and colour of life. This distinctively modern fiction is, therefore, at its best an illustration of the individualism of genius in the field of creative art. Individuality depends upon heredity. Individualism is the expression of the hope which masters heredity; it is our cumulative and compelling idealism—*Harper's Magazine*.

THE PICTORIAL PORTFOLIO.

The Whistler Studio, Mount Road, Madras, have issued a new monthly publication called "The Pictorial Portfolio." It is mainly intended for the artistic reproduction of the notable historical and archaeological monuments of this country. The publishers announce that it will form a continuous serial proceeding from subject to subject, so that each volume when completed will have a distinct individuality and comprehensiveness. Judging from the first number which contains half a dozen photographic sketches of the temple and palace of Madura, we have no hesitation in commending this new venture to the patronage of the public. This is altogether a new move and we congratulate the publishers on the excellence of their venture. The illustrations are printed in good art paper of demi quarto size with an artistically decorated cover. They can be framed or hung upon walls or bound in annual albums of seventy-two pictures. "The Pictorial Portfolio" is modestly priced at Rs. 6 per annum.

EDUCATIONAL.

THE CHILD'S NEED OF PLAY.

The *Chautauquan* publishes the following extracts from a creed drawn up by the Playground League of New York. It is heartily commended to all who, in Great Britain or elsewhere, are interested in the welfare of the child —

We believe that a city child needs a place to play, things to play with, and some one to take a fatherly or motherly interest in its play

We believe that a playground should be made attractive to win the child; varied in equipment to hold the child, who needs constant change; and supervised by directors trained in child culture, who can care for this child garden, as an expert florist will care for his flowers, developing the best in each.

We believe that family life should be encouraged in the playground, avoiding the formal grouping according to age.

We believe that normal play on swings, seesaws, and other such apparatus, or with simple games, such as ball and tag, in varied forms, or with toys such as toy brooms, doll house, etc., to be a better preparation for normal life than exciting competitions and complicated games requiring constant instruction.

We believe that playground work where the character of the child may be best moulded through skilful suggestion, informally given, should be in the hands of persons of the highest character and best training, who will make this a life work—a yearly graded salary as in other professional work being essential to attract such workers.

We believe that the park playgrounds should be open on week day mornings as well as after school, and under supervision, so that the mothers and babies, and physically weak and mentally defective children, may have opportunity for outdoor play when the grounds are not crowded with school children,

We believe that playgrounds should be developed into centres of civic usefulness, beginning in the care of their own play space by the children, this extending to the adjacent park property, and thus leading to an interest and understanding of far-reaching questions.

A TECHNICAL SCHOLARSHIP.

A scheme has been formulated for a technical scholarship of Rs. 75 per month payable for three years in the name of Mr Ganesh Balwant Limaye, of Poona, who has given Rs 25,800 for the purpose. The scholarship will be awarded primarily for study in Japan, but if the Trustees consider that the facilities for postgraduate study available in India are likely to benefit the scholar as much as those in Japan, the scholarship may be awarded for study at a recognised institution in India.

A JESUIT COLLEGE FOR GIRLS.

An important scheme is under contemplation to establish a College in Bombay in connection with the Jesuit Fathers. The scheme proposed, which is still in embryo, is to establish a College for girls where a higher standard of University education may be obtained. There is no College in India exclusively for young ladies, and if a young lady wishes to further her High School education, she has to attend College along with young men of different denominations. It is thought that if a separate College existed, there would then be a greater number of lady candidates appearing for University Degrees. In the absence of this, parents discontinue sending girls to the College, the chief objection being that they would have to mix with all classes of young men, whereas if an institution existed purely and solely for young ladies, parents would greatly appreciate it and a very important objection will be removed. The scheme meets with the approval of H. E. the Governor, and the Roman Catholic Archbishop is greatly interested. Details of the project are not yet ready for official submission to the Government.

MEDICAL.

HEALTH AND MORALITY AMONGST EDUCATED INDIANS.

We have great pleasure in publishing the following communication from Mr. Baij Nath, Retired Judge, Agra.

With the failure of health and breakdown of constitutions in early life comes death which cuts off the best of our men in the prime of youth. In order to ameliorate the present conditions an enquiry is being conducted by me on the above subject. I therefore most earnestly request all University students and others interested in the subject to help me in making it as complete as possible. Information will be welcome on the following points.

1. Conditions under which children are brought up from infancy to the age of 10, the care taken of them by their parents, their home education and surroundings, food, dress, &c

2. Life of our boys in schools The pressure of studies and the way in which the present system of examinations tells upon them

3. Life in Colleges, and the way in which students live in boarding-houses and hostels, the kind of food they eat, their games and recreations, hours of study and average monthly expense of a University student in a boarding-house.

4. Whether the courses prescribed by the University are not too long and whether they are completed within the term

5. What is the percentage of successful candidates in University examinations and what are the chief causes of failure.

6. Whether the system of examinations by compartments will prove more beneficial to students

7. What is the percentage of married and unmarried students in Colleges, and are married students worse than others

8. What are the most prevalent diseases amongst students and to what causes are they due?

9. What is the daily life of an ordinary student and an average educated Indian of to-day?

To all who favor me with full information on the above and other points connected with the enquiry, I shall be glad to present a copy of one of the following books:—

- (1) Bhagvat Gita in Modern life.
- (2) Astavakra Gita Sanskrit text and English translation.
- (3) Sastrokta-Upasana in Hindi.
- (4) Dharma-siksha, 2nd Edition just out, 280 pages in Hindi.
- (5) Student's edition of Kathopanishad by Rai Bahadur S. C. Basu.
- (6) An Easy Introduction to Yoga Philosophy by Rai Bahadur S. C. Basu.

To those giving exceptionally complete information books Nos. 1 to 6 will be sent.

NEW PREVENTIVE OF ENTERIC.

As an outcome of researches made by Professor Metchnikoff and Dr Broughton Alcock at the Pasteur Institute a new vaccine against the typhoid fever germ has been discovered. Excellent results from the use of the vaccine have been reported to the Academy of Sciences. The new vaccine against typhoid consists of attenuated living typhoid bacilli. Dr Broughton Alcock, who with Professor Metchnikoff discovered the vaccine, is a native of Sydney, New South Wales. He will give a demonstration with the vaccine in London shortly.

EVEN FOODS PRODUCE ERUPTIONS.

A number of foods may produce an eruption, especially in those individuals who have an idiosyncrasy for certain articles of diet. Acid fruits may cause an acute eczema. Strawberries frequently produce urticaria. Close observers have said that apples sometimes produce an acneiform efflorescence about the mouth. Walnuts cause an inflammation of the mucous membrane of the the mouth. Shell fish and salt meats often cause a hive like eruption.—*The Medical Standard*.

SCIENCE.

A PRIEST'S INVENTION.

Interesting accounts are received from France concerning tests of a fire extinguisher understood to be the invention of a priest who has been decorated by the French Government. The invention has been described as follows:—

"Two cylinders are used, one of which is small and charged with "ignifuge" gases, which by connecting tubes are used to expel the solution from a much larger cylinder through an ordinary nozzle. The compound is described in the following terms:

"(1) A mixture of ignifuge gases, which as a physical agent, utilizes its elastic force to project a liquid impregnated with salts and as a chemical agent renders the gases of the atmosphere which burn in every fire incombustible.

"(2) An effervescent liquid, in which are found salts in a state of solution. These salts, unknown before, were obtained by the Abbe D. Daney through electrical furnaces of 3,000 to 5,000 amperes. When projected they produce other extinguishing gases which increase the effect of the ignifuge gases referred to above. When reaching the blazing material they cover it with a peculiar dustlike coat, which makes it fireproof."

THE INDIAN PATENT OFFICE.

In course of an interesting Report on the working of the Patent Office during 1911, Mr. Graves observes:—

The Report states that the Act of 1888 has been in force for twenty three and a half years, during which 11,679 applications have been made for the protection of inventions, and exclusive privilege was obtained in 9,113 cases. In 1890 the number of applications was 319, and in 1911 they numbered 807. The increase was due to the rush at the last moment of applicants from the United Kingdom who wanted to obtain certain advantages by applying under the old Act. Mr. Graves further states that during the year

under review the total number of applications under the present Act has been 11,679, and of specifications 9,113, and compared with 1910, there has been an increase of 140 applications. The amount received as continuance fees, by payment of which the existing privileges are kept in force, has increased by Rs. 2,650, and the total income of the office is better by Rs. 3,149.

DIAMONDS FROM COAL GAS.

A Berlin chemist claims to have perfected a process of manufacturing diamonds from coal gas. The latter is decomposed by means of a mercury amalgam, causing the carbon to crystallise into diamonds. The crystallised carbon is very fine, but it has been found that by introducing a small diamond chip in the apparatus the diamonds produced will be gradually built up around the mother crystal.

MENTAL INHERITANCE

Wonderful instruments for measuring the mind were described last month in an address given to the members of the Liverpool (Eng.) branch of the Eugenics Education Society by Mr. Cyril Burt, M.A., Lecturer in Experimental Psychology in the University. Instruments had been invented, said Mr. Burt, for recording the accuracy of mental processes, and for timing the speed of those processes to the one-hundredth of a second; for measuring the delicacy of touch or hearing, and the emotional excitement produced by a picture, an explosion, or a phrase. Methods had also been devised to measure the trustworthiness of the test itself and to gauge how far the results depended on inheritance and how far they were affected by training. Experiments had been carried out in America on twins, at Oxford on children of eminent and of average parents, and at Liverpool on a few parents and their grown-up offspring. The results in the main seemed to confirm the view of the statisticians—namely, that mental characteristics were inherited to nearly the same extent as were bodily characteristics.

PERSONAL.

W. T. STEAD.

The *Review of Reviews* for May is of more than ordinary interest. It is a Memorial Number and contains many remarkable tributes to the memory of the late Mr. W. T. Stead from prominent men and women who have known him intimately all through a career of singular energy. Admiral Lord Fisher contributes a characteristic appreciation of his late lamented friend. In the course of a powerful notice of his life he observes:—

First and foremost he feared God, and he feared none else! He was indeed a human *Dread-Nought*! Next, he had an impregnable belief that "Right was Might, 'and not the other way round'." And so, like David, he would march out alone with his sling and stone, cocksure always of plugging the Philistines between the eyes! I've known him going alone to a packed meeting of his detractors and making them all squirm.

He hated shame and gas-bags and loved to prick a "bubble reputation." Then—no matter who contradicted me—he was a great Patriot! I know the fierce rancour of animosity which he roused—(a dear friend of mine once wanted to shoot Stead like a mad dog)—but Stead was saturated with this great patriotic belief that "The British Empire Floated on the British Navy, and it Floated on Nothing Else!"

Lord Esher writes that "without exaggeration no events happened of national importance to the country since the year 1880 which have not been influenced by the personality of Mr. Stead." Viscount Milner gives a graphic account of his old chief in the *Pall Mall* in the early eighties:—

It has been my good fortune in life to be brought into contact with an exceptional number of men of great and diverse ability. Among them all I cannot recall one who was anything like his equal in vitality. It is quite superfluous to dwell on his gifts as a writer; but his conversation was far more brilliant and stimulating than the best of his writing. I don't suppose any editor was ever so beloved by his staff, from the first lieutenant down to the office-boy. It was such fun to work with him. The tremendous "drive," the endless surprises, the red-hot pace at which everything was carried on, were rendered not tolerable but delightful by his never-failing gentility and by that glorious gift of humour, not always apparent in his writing, which made him so fascinating a companion. His sympathy, his generosity, his kindness were lavished on all who came within his reach. Last but not least, he was endowed with courage, physical and moral, in as great a measure as any man I have ever known.

A wonderfully good portrait of Mr. W. T. Stead by E. H. Mills, reproduced in photogravure forms the frontispiece of the *Review*. Mr. Alfred Stead writes a pathetic note in reviewing the *Program of the World* and assures the friends and admirers of the late Editor and founder that the original programme of the *Review of Reviews* will be scrupulously followed and that he would try to walk humbly in the footsteps of his father.

AN INDIAN IN THE OLD BAILEY BAR.

Dr Abdul Majid is following up his distinguished academic career with steady progress in the legal profession, writes a contemporary's London Correspondent. His lectures for the Colonial Office on Mahomedan law have been so appreciated that he is preparing a text book on the subject under the patronage of the Secretary of State. His latest success has been his election to membership of the Old Bailey Bar, on the nomination of Sir Charles Mathews, Director of Public Prosecutions. He was supported by many prominent English barristers, one of whom, a stranger to him personally, left a case in a suburban court, in order to vote for him. He is the first non-European barrister to be admitted to the prosecution side of the Old Bailey. His friends confidently anticipate that he will prove worthy of the honour.

TAFT VERSUS ROOSEVELT.

In the course of a series of speeches in Maryland, Mr. Roosevelt renewed his campaign against Mr. Taft as an aspirant for a second term as Republican President. He declared that all the "crooked bosses," both Democratic and Republican were co-operating on behalf of Mr. Taft to defeat the plain people of the Republican Party. Mr. Taft in turn devoted all his speeches to criticisms of Mr. Roosevelt's conduct and policies. "I am a man of peace," Mr. Taft vociferated, "and I don't want to fight, but when I do fight I want to hot hard. Even a rat in a corner will fight."

POLITICAL.

A GERMAN ON INDIA.

In *The Times* of April 5 a review was published of a very interesting address on British administration in India by Professor Wegener, who accompanied the Crown Prince during his visit. In the course of that review the following passage was quoted from Professor Wegener's text:—

In 1906 I had a very interesting conversation with the well-known champion of Swadeshi and of Bengali Nationalism, Babu Surendranath Banerjee, who could not disguise from me his astonishment that it should be possible for these ignorant and stupid Englishmen to rule over India.

The Times has now received the following comment on this passage from Mr. Banerjee, writing from Calcutta on April 25:—

I confess that I am astonished that anything I could have said in the course of a conversation with Professor Wegener should have left this impression upon his mind. Whatever knowledge and enlightenment I possess is largely due to the teachings of the great masters of English literature, history and political philosophy. I have never concealed my great admiration for those ennobling influences, due to a large extent to contact with English life and civilization, which have shaped and moulded the life and aspirations of New India. For me to talk of Englishmen as being "ignorant and stupid" is altogether a moral impossibility. What I probably did say—and it is only a repetition of what Lord Morley observed on an important occasion—was that many Englishmen who were entrusted with responsible positions in India knew so little about us and stood so far apart and isolated from us that, in the words of Lord Morley, "living in Asia they really were residing in Europe." This is a statement I adhere to, and its accuracy cannot be gainsaid by those at all conver-

sant with Indian affairs. Half the difficulties of British administration would have been avoided if there was closer contact between the rulers and the ruled, and if those entrusted with authority knew more about the people than they really do. The Royal visit undoubtedly has opened up a new era in the history of the country, which I hope will be fruitful of a change for the better in this direction and will culminate in a better understanding of the people by their rulers and in the establishment of friendly and cordial relations between them. Such a consummation, which I, for one, regard as one of the certainties of the future, must necessarily conduce to the greater efficiency of the Government and the increased happiness of the people.

COLOUR DISTINCTION IN A BAR MESS.

The London correspondent of the *Manchester Guardian* says thus: "I hear that a famous Bar mess within the last week have been much exercised by an attempt to exclude from membership an English barrister of colour. Fortunately the readers of the mess, who bear household names, gave the full weight of their authority to those who were resisting this misguided attempt to set up a colour bar which the traditions of the legal profession, the temper of public opinion, and Imperial policy could not have permitted to remain. The barrister in question was a distinguished Mahomedan of high rank and academic attainments, whose candidature was originally proposed by a famous ex-leader of the Criminal Bar. The opposition came from a small group of young Jingoes who exhibit characteristics with which the wider public has become familiar in the persons of their friends and colleagues in the House of Commons. I am told that the many Indian students for the Bar in London are much impressed by the manner in which their cause was taken up by prominent barristers."

GENERAL

REFORM OF THE HINDU CALENDAR.

We have received for publication the following from Sir Bhalechandra Krishna, Chairman, Hindu Calendar Reform Committee, Bombay:—

The movement for the reform of the Hindu calendar has attracted the attention of Indian scholars and various attempts have been made from time to time in different parts of India to revise the Hindu calendar so as to bring it in accord with observed phenomena. To bring these sporadic attempts to a head it was thought desirable to initiate a common movement, and accordingly a committee was established in Bombay in 1904 to carry out the object. A conference of astronomers and pundits from all parts of India was also held at Bombay in December 1904 under the presidency of His Holiness the Shri Karacharya of Sharda Nath and many leading gentlemen, and ruling chiefs throughout India promised hearty co-operation. The Pundit invited for the conference after an exhaustive discussion lasting several days settled the general principles according to which a new text book which would serve as a guide for preparing Hindu calendars every year should be compiled. A reward of Rs. 2,500 for such a work was then offered by the Hindu Calendar Reform Committee of Bombay, in consequence of which several manuscripts were received from learned men and they were submitted for examination to a representative committee of Pundits. Individual opinions of examiners have been received and acting thereon the committee decided not to give the prize as none of the works were found to be correct and in conformity with the general principles already settled at the general conference. The decision was subsequently communicated to the authors of the manuscripts who were also requested to co-operate in the compilation of the new text which the committee

was going to bring out in some other way. Such a text book had become absolutely necessary, and to be really useful it must be acceptable to leading astronomers in India. It was therefore also resolved that a committee of learned Pundits should be appointed to do the work and that they should complete the book at Bombay within the course of a year. The Calendar Reform Committee is very sorry that all this important work has been so much delayed owing to various unavoidable difficulties; but the committee is determined to carry this highly useful undertaking to a successful end as early as possible. The text book when so compiled by learned scholars will be published and circulated in a proper manner throughout India and the committee is confident that it will be found acceptable to all. The committee earnestly requests all Hindu Ruling Chiefs as well as other wealthy and learned gentlemen in all parts of the country to extend generous support to this holy and highly useful undertaking, and it is confidently hoped that this long-standing question affecting the daily life millions of Hindus will be solved to the satisfaction of all.

A NEW ROUTE TO INDIA.

The newest future route to India is to be by way of Spain, Morocco, Lake T Chad, and the Indian Ocean. The scheme is propounded in a Paris newspaper, and the anticipated advantages of the new railway are that it would bring the Indian Ocean within five days' travelling from London, deprive the Suez Canal of its traffic, shorten the route to India and the East, and earn huge profits by tapping the resources of the whole of Central Africa. As France would control about three quarters of the line she would, it is said, rule the world by holding the road to India. It is recalled that the long discussed trans-Saharan railway has not yet been constructed, although the difficulties can scarcely be greater than those involved in the new proposal.

THE MILK SUPPLY OF INDIA.

BY

RAI BAHADUR LALA BAIJNATH.

THE question of deterioration and decrease in the breed of agricultural cattle is everywhere becoming one of the most pressing questions of the day. Every day witnesses a great decrease in the supply of ghee and milk, the staple food of the Indian in every town and it is now becoming almost impossible to get these articles, pure and unadulterated, except at prohibitive prices. In the case of ghee it is specially bad, and fats and oils and other objectionable substances which are highly deleterious to health are freely mixed with it. Not only the poor and the middle classes but the rich also have to go without their full supply of ghee and milk. Failure of rains for a few months in the year means starvation for numbers of cattle and while human suffering can be alleviated from grain imported from other places in India and abroad, cattle have often to go without fodder. This was painfully apparent in the United Provinces last year when the rains held off in July and is now the case in Guzerat where the appeal of those engaged in the work of famine relief is more for fodder than for grain. The last survey of agricultural cattle made in 1903-1904 showed as follows:—

	Cows.	Buffalo cows.	Bulls and Bullocks.*
India United Provinces	2,227,391	9,661,732	30,363,619
Punjab	7,471,960	3,516,230	11,193,950
	3,061,010	1,883,278	409,529

* Excluding Bengal and Eastern Bengal

Since then no survey has been made. A fresh survey is however very desirable and if made, will probably result in showing a very appreciable decrease on account of repeated scarcities of fodder, increase in the Burma dry meat trade and other causes of a like nature. The attention of the Government of India was drawn lately to increasing the pasturable area for cattle as well as to leave free of assessment lands reserved for pasturage in each village. The reply of the Government was that out of 97,870 square miles of reserved forests, 15,791 were open to cattle all the year round in 1909-1910, that the Government were aware that it was desirable, if possible, to increase the pasturable area, but that the matter was one for the local Governments to decide and that the Government of India had lately sanctioned the experiment of leaving 80,000 acres of waste land in Oudh, free of assessment for the grazing of migratory herds of cattle. The area of forests open to cattle grazing requires, however, to be more largely widened and the experiment of leaving lands for pasturage free of assessment tried in every village.

The question of preservation and improvement in the breed of cattle is essentially one of increased supply of fodder which is impossible without increase in the pasturable land left free of both rent and revenue in all parts of the country. This can only be done by mutual co-operation of the Government and the people. Local Governments ought to carry out the intentions of the Supreme Government in regard to revenue and invite *zemindars* to do the same for rent. Legislation for the prevention of adulteration of ghee and milk should also be resorted to in such provin

ces and the provisions of the law rigidly enforced. The situation should be faced on economical rather than on religious and sentimental grounds. For rural areas the following suggestions are submitted for public consideration:—

1. In each village at least 5 per cent of waste land should be left free for pasturage of village cattle. The Zemindar should relinquish his rent and Government their revenue upon it.

2. Each cultivator of 20 bighas or upwards should be induced to keep at least one cow for every pair of bullocks. If he cannot afford to purchase one, the Zemindar should help him in this respect. Keeping up buffalo cows should also be similarly encouraged.

3. Cultivators of fodder crops be encouraged by abatement of rents and revenue, where necessary.

4. *Gowshalas* with dairy farm attached should be established for each group of villages in each pargana on self supporting principles and their ghee, milk and dung made available to the public and the money realised applied for the maintenance of the institution.

5. Should a cultivator find it impossible to keep all the cows and calves and other milk cattle multiplying in his house, he should be at liberty to sell them to other cultivators or they should be purchased by the *Gowshala*.

6. Lands left for pasturage may be planted with fuel or timber trees like *dhak*, *sheesham*, *nim*, *jaman*, *tun*. This experiment has proved successful wherever tried yielding more profits than agricultural rents, in the shape of fuel, leaves, lac, bark etc. The leaves of such trees have proved valuable manure. They would also serve as useful storages for rain.

7. Bull stallions should be largely distributed by District Boards in each pargana. Otherwise proprietors of *Gowshalas* should get these and make them available for all cows in the vicinity.

8. No cows should be given in charity to those who are unable to keep them, nor should bulls which are useless be let off for show at funerals.

9. Classes for dairy farming should be attached to schools and colleges for agriculture

in each Province and farms on latest principles established by each District Board and students trained in them.

This question of the short and bad supply of milk in towns was discussed at the late All-India Health Conference and in a paper read by Colonel Wilkinson it was pointed out that bad and impure milk was supplied in every town of India in place of the good and pure article for sometime past, that the military authorities had established dairy farms of their own in most Cantonments and some capitalists had done the same in some towns, but that the former were for the military and the latter for the rich few, that the milk supplied to the public was of cattle kept in dirty and ill-ventilated houses, fed on dirty substances, milked in dirty and impure vessels, that it was often all bulls taken out, that the water mixed with it was of dirty ponds and it was brought to towns in dirty vessels ill-covered with grass and that the cattle whose milk it was were often diseased and emaciated. The remedies suggested by the learned doctors were (1) the imposition of a tax upon all cattle except those owned by private persons, so as to discourage them being kept by "*Gawalas*" within Municipal limit; (2) establishment of settlements of "*Gawalas*" two or three miles away from the city, in lands and sheds let free of rent, (3) remission of tax upon milk brought within the town (4) periodical inspections of those settlements as well as of the milk (5) supplying "*Gawalas*" with vessels of the best European makes for milking and (6) licensing sellers of milk. How far these suggestions could be carried out in practice in our towns by our people, situated as they are is for those better informed than myself to judge. I should however think that the scheme, excellent as it looks, overlooks one important factor in the supply of milk viz increased supply of fodder for the "*Gowala's*" cattle. The latter feeds them on dirty and impure substances because he is too poor to afford better. He finds good fodder getting scarce or selling at prohibitive prices, (30 seers a Rupee) and has to use leaves and other things not fit for cattle to eat. Sometime ago the Government of the United

Provinces opened the grass on road sides to grazing of cattle, free of charge. But it is doubtful if it is kept open everywhere. Then again under the system of the milk business in vogue in most towns each "Gowala" takes advances from his *Halwai* and is under contract to supply him with a certain quantity of milk daily at a certain rate all the year round. Will he be able to do so under the proposed system? I am afraid it will prove rather expensive for his small means. He and his "Halwai" will on the contrary most cordially carry out any scheme of reform in which arrangements are made for a more increased supply of fodder; otherwise it will prove to be about as little attractive as many other reforms of the agricultural department which in spite of all the money and energy spent upon them, have failed to find their way amongst the agriculturist population. Poverty and ignorance are two great opposing factors to all such reforms and it would be sometime before they disappear from the Indian Jail. Perhaps a better plan would be for private persons to start dairy farms in all towns on co-operative principles and for Municipal Boards to encourage them by remission of Municipal taxation, supply of land, bulls stallions and dairy apparatus at low rates or even free of charge. From what I know of the business in ghee and milk in Delhi and other places, I am sure that even an ordinary shop offering to supply pure and unadulterated ghee and milk, with a capital of Rs. 5,000 or Rs. 10,000 will soon prove a success. We have found this to be the case in the manufacture of sugar and sweetmeat on a small concern in Meerut and soon intend to try the experiment for ghee in Agra. If others do the same everywhere one of the most increasing troubles of Indian society will soon be removed. The work is one of profit as well as of public utility in the preservation of the health of the nation, better rearing of children, more strength of body and mind for students and better nourishment for all classes of people and we ought to attend to it, the sooner the better.

In the Punjab an Indian gentleman who owns the Amballa glass works is going to try

the experiment of manufacturing condensed milk and milk powder from the latest and most up-to-date apparatus. He hopes to receive the help and co-operation of the Punjab Government who are going to give him a large tract of grazing land on favourable terms. The trade in condensed and powdered milk imported from abroad is not inconsiderable. On the contrary if condensed milk and milk powder free from all foreign matter were manufactured in India on a large scale, it would yield good profit as well as help to supply the want of milk. A capital of Rs. 10,000 will start a decent business. Most of the "ghee" here is manufactured from buffalo's milk. Cow's milk is not so rich in fat. If those who keep dairy farms were to keep both cows and buffaloes they would find it more profitable than keeping cows alone. A good buffalo yielding 8 or 10 seers of milk, costs about Rs. 50 or Rs. 60. It is a very useful animal though of uncouth appearance and its calves do more work than bullocks. All the ghee manufactured in upper India, being from buffalo milk, the improvement in the breed of the latter is as important as that of cows. How to perfect adulteration of ghee is another serious question. Thirty five years ago the rate of good ghee was Rs. 16 a maund. Twenty five years ago it was Rs. 20. Then it went up to Rs. 30 or Rs. 40. Last year it was Rs. 50. This year it is Rs. 60 a maund and is steadily rising. Milk which formerly sold at Rs. 2 a maund is now selling at Rs. 8. High prices corrupt adulteration and the latter is not confined to butter milk as it formerly was but also tends to fats of even highly objectionable and disgusting animals. This is done when the ghee passes from the hands of the maker in the village into those of the wholesale dealer in the town. The adulteration increases at each step. The remedy besides legislation lies in more increased supply of fodder and a much larger number of good dairy farms managed on proper principles. There are *Goushalas* for protection of cattle in almost all places of India. The Hindu is especially attracted to anything which professes to have cow preservation. But most of these *Goushalas*

are ill managed. Living upon public charity which is never steady, they soon begin to languish and fail to afford protection to the cattle made over to them. A better plan would be to combine business with charity and utilize the *Gowshalas* as dairy farms for the supply of milk and ghee at reasonable rates to the public and applying the proceeds for the up-keep of the *Gowshala* as stated above. The question of the proper supply of ghee and milk is one of national importance. The future of the Indian people greatly depends upon proper supply of these articles as well as upon the improvement in the breed of agricultural cattle. Should these fail, the nation shall have to face a great misfortune. It therefore behoves all classes of people seriously to consider the situation. From replies received to my circular letter about the failure of health and premature deaths amongst educated Indians, I find most medical men of note attributing both, to bad and insufficient ghee and milk supply of towns. It is therefore the concern of our educated people to take the matter up before all others. Many a young graduate pining for employment under Government or wasting his time at an over-crowded bar, would find it more profitable to turn his attention to dairy farming. A couple of years' training would enable him to start the business and it will prove not only one of profit to himself, but also of great philanthropy in contributing to the well-being of his fellow men. May I hope that many of our young people will do it.

FISCAL FREEDOM & PROTECTION FOR INDIA.

BY

PROF. V. G. KALE, M. A.

"If we are to try to govern India in accordance with Indian ideas—a principle with which I humbly but fully agree,—how could we justify the refusal to India of the fiscal autonomy for which there is a far more widespread and genuine demand than for political autonomy?"—Mr. Valentine Chirol in *Indian Unrest*.

"I do not pin my faith to Free Trade, and I do not pin my faith to Protection, I hold that the policy most conducive to the prosperity and happiness of the people of India is the policy which should be adopted for India"—R. C. Dutt.

ADVANCED thought in Political Economy assigns to the state a very wide sphere of activities for the promotion of national well-being—political, social, intellectual and economic and it is obvious that unless this broader outlook is adopted by the state in this backward country no rapid economic development can be assured in India. Apart from the question whether Free Trade or Protection is the policy best suited to the present conditions in India, it has been admitted that a larger measure of freedom must, in this respect, be accorded to the Government of India if it is to do its duty by the people entrusted to its charge. The advocates of this financial and fiscal freedom are not unconscious of the constitutional relations of that Government to the British Parliament and of the inevitable dependence which those relations entail. They do not, by any means, propose complete financial and fiscal any more than political freedom, for this country. That will be disastrous to the best interests of the country itself. There are many who, on the other hand, press for a more effective Parliamentary control of the Indian administration and policy, and the imperial constitution, so far as this country is concerned, supports their view. In any case it would not be wise, for many years to come, to weaken Parliament's hold upon the direction of Indian affairs. The demand that the Government of India may be allowed more freedom is not, however, inconsistent with this hold. The claim has often been made on behalf of British

and immersed in their own problems and interests. Financial and fiscal dependence is certain to preclude a state from following an economic policy which it deems the most suitable to the conditions of the people in its charge. The conservation of the mineral resources of India for which even such an authority as Sir Thomas Holland has been pleading, the stimulation of Indian enterprise and the greater employment of indigenous capital, the need of encouraging Indians to take a larger share in the exploitation of their country's material resources, and the framing of the Indian tariff in such a way as to promote economic progress in India, are questions whose satisfactory solution involves a larger measure of the liberty of initiation and action on the part of the Government of India than is available at present. That such freedom the Government will ultimately obtain cannot be doubted and it is gratifying to note a steady tendency pointing in that direction. Conflict of interest and of theory are the two great obstacles which bar the way to the attainment of this object. With the more liberal and progressive ideas that are expected to predominate in Great Britain as to its political mission in India the first difficulty must gradually diminish. As to the second impediment also, public opinion in India is bound, year after year, to carry more weight in the conduct of this country's affairs, and that opinion must become the final judge in matters of the state's economic policy. There is no need to fear that responsible Indian opinion will be hostile to British interests, though it will insist upon the interests of this country being shown prime consideration.

It is well-known that the educated classes in India are keenly desirous of seeing their Government adopt a policy of Protection and give direct assistance to the industrial progress of the country. With rare exceptions, the bulk of the educated people have no faith in abstract free trade and they would like their state to revive and stimulate the indigenous industries just as the Governments of America, France, Germany and Japan have done. Mr. Valentine Chirol remarks:—"It must be remembered that the desire for Protection is no

new thing in India. Whether we like it or not, whether we be Free Traders or Tariff Reformers, we have to reckon with the fact that almost every Indian is a Protectionist at heart whatever he may be in theory."* For the past generation, students of economics and leaders of public opinion in India have been pleading for protection. Men like the late Mr. Justice Ranade and R. C. Dutt have shown in their works how under a regime of Free Trade, India's industries have decayed and how therefore they require the fostering care of the state. The Presidents of the Indian Industrial Conference have harped upon the same theme year after year and the Indian press and platform are clamouring for Protection. Indian Protectionism is no sudden outburst of popular caprice or of love for a new theory, nor a passing wave of an ignorant public agitation. It is the outcome of a long and careful study of the past and contemporary history of this and other countries and the result of the mature judgment of its thoughtful and far-seeing leaders. There can be no doubt that some of the exponents of Protection in India have shown a tendency towards hasty generalizations and have lacked the broad outlook and the grasp of the momentous issues which that problem involves. Some of the more intelligent and coolheaded among them entertain grave doubts as to the beneficent effects of a policy of wholesale Protection introduced in India. This is, however, a difference of degree, one of method and immediate policy. There is a consensus of opinion in the country that the existing system of Free Trade must go and must give place to one which is more suited to the needs and peculiar conditions of the Indian people. Even Lord Minto has given expression to his conviction that some amount of Protection such as the self-governing colonies like Canada have been giving to their industries, is needed in India if its indigenous industries are to revive.

The Free-Trade-Protection controversy is a very old one and the arguments for and against either policy may be seen marshalled in any decent text book on Political Economy.

* "Indian Unrest."

It is, however, yet a burning question in England. Free Trade and Protection have become the watchwords of political parties there and the tariff reform agitation has given birth to copious literature on the subject. So far as theory goes, it is difficult to make any useful contribution to the discussion as the question has been looked at from every point of view and all conceivable arguments have been exhausted. The proposition that Free Trade must ever be good for all countries is no longer accepted as gospel truth, and the decision of the question in any particular case turns upon whether a policy of let alone and free competition or of Protection is best suited to the given conditions. It is not a purely economic problem to be discussed in the academic fashion. Political, social, and national considerations play an important part in the practical discussion. Advanced economic theory also justifies the adoption of a Protectionist policy by nations in certain stages and circumstances. Protection is not certainly a panacea for all industrial and social backwardness and may exercise deleterious influences upon nations going in for it. Free Trade may, again, be calculated to promote the best interests of a people. The balance of advantages is, however, likely to lean towards a Protectionist policy and it is on this ground that it is being followed by the United States of America, the countries of the European continent and the British colonies. Indian advocates of Protection desire to profit by their own past experience and the example of other countries. They take exception to the doctrine that because Free Trade is good for England it must be equally good for India, which has swayed the policy of the Imperial Government in this country. They plead for liberty to their Government and to themselves to decide whether Free Trade or Protection is needed in India and what form either policy should take. It is a matter which must be considered on its own merits and dogmatic Protectionism would not be less injurious than theoretic Free Trade has been.

As commonly defined, Protection as a policy is an attempt to develop a manufacturing in-

dustry by a system of discriminating duties on manufactured goods imported from other countries. This definition is, however, too narrow and does not take account of other factors supplementary to this fundamental one and designed to emphasise its purpose. Protection should therefore, be defined so as to include all means by which a country undertakes to secure, through positive efforts of Government, complete industrial and commercial development of all its resources. Protectionist policy embraces all those pecuniary or other sacrifices which a country may make in order to develop its industry and commerce and is justified on political, economic and social considerations. Looked at from this point of view, England, the stronghold of Free Trade, is itself to a certain extent, Protectionist.* The development of the Protective system is due to the growth of capitalism and national states. As doctrine, protection is a modification of the old doctrines of mercantilism and the state is looked upon as a powerful means of developing industries. In modern times the doctrine dates from Alexander Hamilton who propounded that the highest development of a nation's industries was to be achieved by protective duties and his programme was adopted by the United States of America. For the ultimate good of the nation the consumer was to be made to bear the burden of taxation. Like the American Hamilton, the German List thought that Protection was to be adopted as a temporary measure for developing a nation's industries. Free Trade was accepted as generally true but was suited to a cosmopolitan stage to which the world is progressing. For the attainment of this end each nation must develop its own resources to the full. While Adam Smith's system of political economy was cosmopolitan, that of List was national. In the hands of other Protectionist economists like H. C. Carey and Patten, Protection changed from a temporary expedient to gain a specific end to a consistent endeavour to keep society dynamic and progressive. Economists of other schools, with the exception of rigid British Free Traders, have allowed a relative validity

* Encyclopedia Britannica, 11th Edition.

to the doctrines of List, and the historical school of economic thinkers generally looks at Protection from political and social considerations rather than the purely economic one. It is in this wider sense that the word Protection is used in India when the state is called upon to grant protection to the indigenous industries. A policy of protection does include the raising of import duties upon foreign goods coming into competition with the domestic products, but a high tariff is only one of the means of achieving national progress. The later trend of economic thought is entirely in favour of an extension of the province of the functions of Governments which were restricted within the narrowest limits by the earlier economists, and it is considered as a legitimate duty of the state to undertake pioneering work in connection with new industries and in other ways directly to promote the growth of national wealth. In a backward country like India which suddenly found its industries confronted by improved European manufactures, this duty of the state becomes more imperative than elsewhere. The British Government in India has shaken off, in certain matters, the shackles of the rigid economic theory of Free Trade and of the legitimate functions of the state, and there is no reason why a further advance should not be made along the selfsame lines. "If the State can legitimately undertake from borrowed funds the construction and subsidization of railroads and canals, if it can afford to sell the fee simple of waste lands at nominal rates to European settlers on the hills, the road is certainly open for a further development of this same industrial effort on new lines." Mr. A. Latifi, I.C.S., in his "The Industrial Punjab" observes:—"Most people now admit that it is an important function of Government to develop the strength and skill of the people, to induce them to economise their energy by the aid of science and art, and by the multiplication of industries, to afford them a livelihood from the greatest possible varieties of sources.....The disputants have often argued with the conditions of different countries and

different ages before their eyes, forgetting the homely saying that what is one man's food may be another's poison. Nobody denies, however, where private enterprise is, for any reason, unable to develop a given industry, even a free-trading state may lawfully create a condition of things that will set private enterprise in motion."* As an illustration of what the initiative of the Government, supported by the hearty co-operation of the people, can achieve within the lifetime of a single generation Mr. Latifi mentions the state of Wurttemberg in the German Empire where within fifty years a purely agricultural country was transformed into a highly developed industrial state. This wonderful result was due to the feverish activity which ran in all directions, the introduction of schools for teaching trades, advancing money for the establishment of industries, the starting, by the state itself, of new industries to be ultimately absorbed by private enterprise in the form of companies or associations, sending skilled workmen abroad to acquire a knowledge of new methods in trade and agriculture and so on. The year 1868 marks, in Japanese history, "the commencement of a new policy under which the commercial and industrial interests of the country have been aided by lavish expenditure on technical education, by the dissemination of useful intelligence, and by the subsidizing of struggling industries."

It was the Government that pioneered the manufacture of cement, glass, soap, paper, paint, type and machinery."* It is only within recent years that the cause of industrial development has been taken up by the state in India, and its attention has been mainly confined to improvements in agriculture. But what can it show to compare with the astonishing zeal of the Japanese Government, which has worked miracles within the space of a single generation? We are going at a snail's pace where we are moving at all, and laying the unction to our souls that we are doing our best and that nothing more is practicable. What a vast field is open for activity in agriculture and industries dependant thereon, let alone other industries and manufactures such as

* Kanade's "Essays on Indian Economics."

* "The Industrial Punjab", by Mr. A. Latifi, I.C.S.

paper, glass, oils and so forth, may be seen from the discussions on the subject held by the Board of Agriculture at Pusa.* Among other resolutions passed by the Board on the Sugar Industry which is now receiving its particular attention, was the following:—"The Board recommends that Local Governments should be empowered to assist pioneer factories, by subsidy, by taking deferred shares, or by such other methods as may be appropriate; and urges the need for a reconsideration of the recent orders of the Secretary of State, in so far as they prevent the application of public funds to the development of those industries which are essential to the increase of the wealth of the agricultural community." The Secretary of State, during the *regime* of Lord Morley, issued certain orders limiting the power of Local Governments which were thereby precluded from giving effect to the above resolution and the Board urged that those orders should be reconsidered in the interests of agriculture and agricultural industries. The attitude of the Secretary of State in this matter betrays the blind faith of a devoted adherent of the rigid doctrines of the old school of economists and it is the emancipation of the British Government in India from the thralldom of exploded economic theories that the advocates of protection in India are pleading for. The departure which the Board of Agriculture seeks in one industry must be extended all along the line if the economic and industrial situation in India is to undergo any appreciable change for the better. This demand is the essence of Indian protectionism which is broadbased upon advanced economic theory and appreciation of the practical needs of this country.

The question of protection received prominent attention in the discussion, in the supreme Legislative Council some time ago where the Hon'ble Pandit Madan Mohan Malaviya moved his resolution in favour of a higher import duty upon foreign sugar. The Pandit based his contention upon the principle that "a

nation must sacrifice and give up a measure of material prosperity in order to gain or retain the power of united production; that it must sacrifice some present advantages in order to insure to itself future ones." In theory this position is unexceptionable, but the practical action must be determined by various considerations in each case. Any one who knows the present condition of the indigenous sugar industry is aware that an enhanced import duty upon foreign sugar, which may be defensible on other grounds, cannot be supported by the argument that it will result in any immediate and direct benefit to the industry. One great objection to protective duties is that they produce powerful combinations of manufacturers and merchants whose operations are not always beneficial to society at large; and it must be taken into serious consideration when we devise such duties. Speaking on the subject of the suggested sugar duty in the Viceroy's Council, the Hon'ble Mr. Gokhale observed:—"The right kind of protection is that under which the growing industries of a country receive the necessary stimulus and encouragement and support that they require, but under which care is taken that no influential combinations, prejudicial to the interests of the community, come into existence. And I believe that the right kind of protection, if available, will do good to India. But Sir, situated as India is, I fear there is no likelihood of that kind of protection being available to us, and it is my deliberate conviction that in our present circumstances, a policy of free trade, reasonably applied, is, after all, the safest policy for us." And further:—"If the Government of India or the Secretary of State had the power to grant protection in the present circumstances, I am not sure that it would be employed in the best interests of the people of this country. I, therefore, personally, do not ask for a high protective tariff but I urge that an inquiry be first made to find out in what way and to what extent the state can help this industry." It is not difficult to discover what was at the back of Mr. Gokhale's mind when he expressed a doubt if protection would be employed in the best interests of the people of this country.

* Proceedings of the Board of Agriculture in India held at Pusa, November 1911.

Excepting the cotton mill industry, the other manufactures in this country which are in a flourishing condition, are almost all of them in the hands of non-Indians whose organization, power, wealth, up-to-dateness and influence with the Government here and in England, are well-known. A high tariff wall raised against foreign sugar will immediately be taken advantage of by European manufacturers and merchants, leaving Indians hardly better off than before. India may incidentally gain but it is a delusion to suppose that there will be any direct and substantial benefit to the people themselves. The tea plantations, jute cultivation and manufacture, the mining industry are illustrations which show conclusively how Indians have not been able to exploit the resources of their own country and how the work has been successfully done by European enterprise armed with various advantages. Protective duties or no protective duties, the factor of European manufacturers and merchants must dominate the industrial situation and Indians have got to make the best of the same. It is inevitable in the peculiar circumstances of this country that purely Indian enterprise must step forward and rub shoulders with its European compatriot and rival. Whenever a new industry is started with Government co-operation such as the paper or match industry, for example, European enterprise is bound to be the first in the field and it will be the fault of the Indians themselves if they are slow to take their proper share in the industrial development. This aspect of the situation has been grasped by certain well-meaning opponents of Indian Protectionism and should be clearly understood by all who are interested in the question. There is an amount of truth in the shrewd remarks made by the Hon'ble Mr. A. Chatterton in this connection. He says:—"What I would submit for your consideration is that even if protection were desirable, you are not ready for it. There is no fund of capital seeking remunerative investments. Industrial leaders with technical skill and business experience are non-existent and the operative labour could only be obtained with difficulty

and would require training from the very beginning. You might exclude British manufactures, but you cannot exclude the British manufacturer."* Mr. Chatterton, it must be stated here, is far from right when he assumes that the object of the Indian Protectionist movement is chiefly to exclude British manufactures and that "the recent cry for industrial development comes from a small minority of unemployed educated people who have not yet found a suitable niche for themselves." This misconception notwithstanding, his estimate of the industrial needs and prospects in India, is substantially correct and must be borne in mind by all those who are inclined to suppose that protective duties are a panacea for the economic distemper of the Indian nation. What Indian protectionists must press for is a relaxation of the rigidity of the present almost passive economic attitude of the Imperial Government with respect to the industrial development of the country. They must persist in the demand that the Indian should take vigorous steps to stimulate industries in every possible way and not leave the people to themselves in the matter. Every case of protective duties will have to be judged on its own merits; but there can be no doubt about the general responsibility of the Government towards the people with regard to industrial development. To insure against and minimise the disadvantage to Indian enterprise of the powerful competition of European merchants and manufacturers in India, it has been suggested that Government should insist that a certain proportion of the capital invested in every new concern must be purely Indian. But it is difficult to conceive how the state can be brought to accept this suggestion in the face of the opposition that is sure to be raised against it. It, however, shows the manner in which the policy of the Government of India ought to be shaped in the interests of the people of the country. Indian Protectionism is thus emphatically a national policy designed to promote the industrial and economic progress of the people and

* The Journal of the South Indian Association, April 1911.

as such ought to find favour with Government. The state in India has, however, its own difficulties and it is through them that we have to march towards the goal. Mr. Chatterton, who takes the Indian Protectionist movement in its aspect of tariffs only, is nevertheless of the opinion that "a little paternal assistance of a direct character, the cost of which can be accurately determined and the operations which we carried on definitely limited, is a more logical and businesslike method of dealing with the industrial question than subjecting the whole country to a system of tariffs which will increase the cost of living and direct energy from its natural channels into artificial courses, most probably not leading to the best utilization of the resources at our disposal." This position is a reasonable compromise between the two Free Trade and Protectionist extremes and is deserving of serious consideration.

THE HINDU-MUSSALMAN PROBLEM.

BY

MR. HUSAIN R. SAYANI.

It need not be said that if people had the good sense, tact and inclination to meet half-ways in their differences and disagreements, whether the matter in dispute be small or great, whether it be between one individual and another, or between a whole community and another, there would be much more peace in this world and consequently a much easier way to progress and civilization. These remarks apply especially to our country where it is so difficult to leave aside the mere sectarian point of view and look at things from a broad and statesman-like point, divided as we are in a thousand divisions of sects and community, class and creed. The illiterate among us—and by far they are the vast majority—can be excused for their narrow prejudices, their stupid superstitions and a

hundred other things which easily and readily instigate them to fly at one another's throats. The panacea for their evil lies in the one word 'education.'

It need not be said that the education and advancement of any one division of the people goes indirectly to the benefit of the other divisions also. Every sensible and knowing Mahomedan will readily admit that these Hindus who have worked for the social, material, and intellectual progress of their community have indirectly benefited the Mahomedans also; as any sensible Hindu will admit that the contributors to the Aligarh University fund have indirectly advanced the Hindu cause too. Most of us will also agree that the ultimate political union between the two great communities, if it ever comes, can only come through educating the masses of both the communities. But apart from the question of educating the masses, we should briefly go over some of those things which should facilitate the formation of such a union on a sound and far-reaching basis.

First of all, there should always be among the well-to-do, and the educated of both the communities a spirit of compromise, and a marked inclination to take things from a broad point of view and not from a narrow and sectarian point. Whether it be in speech, writing or action, if this spirit is maintained, and this inclination shown on both sides, there would be considerably less cause for irritation and consequently a considerable avoidance of occasions which give rise to ill-feeling between the two communities. Look at some of our papers. Many a time they leave aside the broad point of view and stick only to the narrow which suits only a particular class or community. Indeed, a few of them persist so outrageously in the taking of the narrow view as to give offence to any fair-minded person of any class or community.

That, as a people we are sadly wanting in the spirit of compromise, of meeting half-ways in

our differences and disagreements, is evident from our readiness to go to litigation even on small matters and such claims as could easily be compounded. One has only to look to the law courts to see how often a lot of money is wasted in useless litigation. If the parties had only the necessary spirit of compromise they would not waste so much money which only goes to swell the fat bills of shrewd lawyers.

The same remarks apply equally to the services, the professions and even to trade. Here also a keen class-community and creed jealousy, ready to oust the person that belongs to the other class, creed or community merely for his being so, irrespective of his merits and to hiring in the cue that belongs to one's own is often evidenced. Such attempts leave scars behind and serve to widen the gulf between different communities.

Even in politics and public life a real lack of the spirit of compromise and a want of large heartedness is shown. Why should some of the Mahomedan councillors have the inclination rather to join hands with the government party in any and every matter than with their Hindu brethren in council? Or why should the Bengali Hindus grudge the facilities in education given to the Moslem Mahomedans even from a purely Hindu point of view an educated and cultured Mahomedan is more likely to serve the purpose of his country, Mahomedans and Hindus as well, than an uneducated Mahomedan labouring under the load of ignorance and a hundred evils born thereof. The material, social and educational progress of the one community must be shared, more or less, by the other, so be there in the same boat, falling in easy cases against common difficulties and according to many common aspirations. The only sound policy, therefore, on the part of both the communities is to help each other and to keep themselves abreast of each other in the forward march. If one of them is left far

behind the other, what a clog that one would be in the way of the other's attainment of its aspirations. To give an instance, if the Mahomedans had not made the progress during the last ten years that they have done, could we have got the political concessions that we recently did, notwithstanding the fact of the Hindus' social and educational progress.

Nothing can be more deterrent even to a political combination between two communities than a lack of the spirit of compromise where their individual interests clash, and a disinclination to meet half way in their differences and disagreements. But if the two communities have the proper spirit of compromise and add to it the higher traits of character a large heartedness which is willing to give the full benefit of the blessings and advantages enjoyed by the one community to the other, a willingness to give more than to receive, a breadth of view that embraces in its ken the difficulties and troubles of the combining party and is ready to help it out of them, then they can combine in a solid and far reaching combination. More education of the intellect may remove, to a great extent, ignorant prejudices and misapprehensions standing between different communities. It may make them understand that to remove common difficulties and attain common aspirations there is no help for them but to unite in a strong union on a firm basis. But something more is necessary, in order first to form a combination and then to obtain in that combination exulting strength. That something lies in the development of the higher traits in the character, a large heartedness, a fair mindedness, a willingness to forget past misunderstandings, a patriotism that goes above a national and sectarian interest and embraces the welfare of every class, creed and community of the mother country. Such a patriotism must show itself not in mere words but in action. It means a development in the character along with a development in the intellect, a development

that should begin at home, should be kept up at school, strengthened and fed full at the college in order to fructify in the active life of the citizen. The effect of such a development should be apparent first within the community itself before it is revealed in the relations of one great community with the other. It should show itself first in the relations of the high caste Hindu with his brother of the lower caste, in the removal of the social abuses of his community, in the uplifting of its social and moral standard. In the same way it should show itself first in the social, and educational advancement of the Mohammedan community before it is manifested in the dealings and relations between the two great communities. How can a community win the respect and confidence of another, or how can it wield a great influence for the good over another if it has not reached a certain standard in its social moral and educational progress. How far a way we are still from that standard it is difficult to judge, but it is certain there lies yet a considerable way before the two communities to traverse before they can reach that standard.

THE ANCESTOR-WORSHIP OF JAPAN.

BY

MR. CHARLES PARRY, B. A.

JAPAN is popularly supposed to have three religions, Confucianism, Buddhism and Shintoism. This statement, however, is misleading. The first of these, Confucianism is a philosophy of conduct, an Art of Living, but cannot be called a religion; for the attitude of Confucius towards the question of a Future State and in general as regards the aim and meaning of man's existence on this planet, was one of complete agnosticism, if not of contemptuous indifference. The model Confucianist is an accom-

plished Chinese gentleman and, in the good sense, a man of the world, but by no means a religious man. As for Buddhism, it never "had a fair show" in Japan; it entered the country after it had been grossly corrupted during a thousand years of its slow passage through Tibet, China and Korea, and it came to a people who, while accepting it in this form and further modifying and corrupting it, were and are incapable of assimilating the high truths which it inherited from Hinduism and which form its essence. Japanese Buddhism is now, therefore, an established cult with thousands of temples and tens of thousands of priests, yet, in reality, nothing but a corpse in fine sacerdotal vestments, galvanized into a show of activity by the stimulus of opposition to Christianity.

There remains then only the last named, Shintoism which can be correctly called the Religion of Japan. Shintoism is a curious, vague compound of Nature fables, Emperor-worship, ancestor-worship and patriotism; and it is also called by the Japanese *Kami-no-michi*, the way of the Gods. There *Kami*, or Gods, are all of strictly Japanese manufacture, having no dealings with or knowledge of the outside world, and are as characterless and puerile a set of deities as have ever assembled together. Of the above mentioned elements of Shinto, that of primitive nature-worship which is perhaps disguised under the childish fables about these *Kami* has now little influence compared with the politico religious element of ancestor-worship including the worship of the Imperial Family past and present. By the efforts of Japanese statesmen and scholars in the eighteenth and early part of the nineteenth centuries,—efforts influenced much more by political than by religious motives—the part played by ancestor and Emperor worship were raised to such prominence as entirely to overshadow the older features of this curiously jumbled religion. In China, also, ancestor-worship has the strongest influence over

to the rank of a religion afford, it is true, a sort of basis of morality; but how poor they are compared with the magnificent breadth of such passages of the Bhagavad Gita as "Nor know I which for us should be the better, that we conquer them or they conquer us"—"However men approach me, even so do I accept them, for the path men take from every side is mine."—"Even though thou art the most sinful of all sinners, yet shalt thou cross over all sin by the raft of wisdom"—"Seated equally in all beings, the supreme Ishvara, indestructible within the destructible—he who thus seeth, he seeth." How the dogmas of a narrow national creed shiver up in the light and heat of the rays of the true world Religion!

In accordance with this, we find that the Japanese are seemingly incapable of taking broad views of human life and duty. The Brotherhood of Man, the essential unity of the race are conceptions that convey no meaning to them. The truths contained in Buddhism have been completely lost on this energetic but narrow-minded race, and Japanese Buddhism has, from the first, been a matter of mere ceremonial and, with the vulgar majority, little better than a conglomeration of superstitions about luck, while nowadays it is taken seriously by hardly anybody. To unite Buddhism with a jingoistic national religion was of course to distort it beyond recognition.

The modern scientific explanation of the origin of Ancestor-worship as due to the "dread of ghosts" felt by savages is naturally unpleasing to civilized people who at the present day uphold this form of worship. Unfortunately for them, the evidence of travellers who have closely studied savage races all goes to show that such is its origin. It is not love and affectionate memory that urges the savage to propitiate the ghosts of his ancestors; in fact, some tribes which are barbarous enough to kill their parents when they become old and helpless are yet found to show the

greatest respect for dead ancestors and the greatest desire to propitiate them by offerings. The ceremonies performed in ancestral worship to day in Japan all point back to the original savage idea that the ghost needs feeding.

There is indeed something touching and sacred in the loving remembrance of the dead who have been kind and helpful to us, and so far as this, ancestor worship appeals to Christian and non-Christian alike. But if this feeling is made into a matter of daily, burdensome ceremonial, when death must be celebrated not only yearly but monthly, when national conceit and anti-foreign spirit are fostered in the name of religion, a weak mortal decorated with the title of Emperor is revered as a god and practically the only god worth considering, then the religion of ancestors becomes a curse.

The modern agnostic spirit has made great inroads on all the observances above mentioned, and they have been reduced and curtailed to such an extent that the Japanese religion of to day is not an exacting one. Yet, in spite of all official endeavours to keep up the spirit of Shintoism in connection with the adulation of the Imperial Family and the narrow aggressive nationalism which has been grafted on the original crude nature and ghost worship the religion is doomed to extinction; it is dropping to pieces from internal decay. It has no capacity for extension beyond the bounds of one nation, no philosophy of life, no theory of the Universe, no conception of the Brotherhood of Man or the Fatherhood of God—in short, no message for the modern mind.

KAMI NO-MICHI: The way of the Gods in Japan by Hope Huntly Price Rs 2-4.

The desire of the author is to guide her readers faithfully along this time honored, half obliterated "Way of the Gods", clearing the path with reverent, not iconoclastic hands, because recognising it as the Way by which the Japanese were divinely led to their present mental altitude. The path is traced in threefold aspect Ethical, Philosophical, and Romantic.

The story trends towards a sensational climax in order to emphasise life portraits known to the author while resident in the country.

G. A. Natesan & Co., Sankarana Chetty Street, Madras

A CENTRAL ASIAN BRUTUS.

BY

PROF. MICHAEL MACMILLAN M.A.

IF my prison was cold and gloomy, at least it was high and dry. But I knew too well that there was a dark damp dungeon at the bottom of the feet and there was every reason to apprehend that my gaolers would presently let me down into it, if it should not be deemed advisable to despatch me outright. A narrow window admitted the last rays of the setting sun. It was accessible and wide enough for my body to pass through. But this only tantalised me, for below it was a sheer wall absolutely devoid of any foothold, so that dropping from window the would be certain death. Perhaps it was intended that I should creep out and thus bring destruction on myself, so that the lord of the castle might not have my death on his soul. For I was his nephew and the rightful heir to his lands and chieftainship which he wished to leave to his daughter and her intended husband, rich old Abul Haasan. This arrangement I strongly objected to for obvious reasons. No one likes to be cheated out of his inheritance. In addition I happened to be in love with my cousin, Aisha, while I hated Abul Haasan, the Fat, with the hate of hell.

As the waning sunlight began to fade, my thoughts became more and more melancholy. What I dreaded most of all was the application of the blinding fire-pencil to my eyes or a draught of the stupefying *ponat** to reduce me to imbecility. These favourite methods of incapacitating for action a dangerous rival, whose murder, however desirable, is repugnant to a nice conscience, haunted my imagination more and more as the prison cell grew darker and darker. It was too

* *Ponat* is an infusion of poppy. It enfeebles mind and body.

horrible, the prospect of being suddenly cut off in the heyday of youth and strength from active life and condemned to burden the earth like a fallen tree. Rather death than that! And as this thought passed through my mind, unconsciously I found myself moving towards the tempting aperture of the window. But, as the Persian poet says,

"Every good and evil that exists,
If you mark it well is for a blessing."

My fortune was now at its lowest ebb, but to this my unhappy plight I was indebted for all the happiness I have since enjoyed. Had I never been imprisoned and in danger of death or worse, Aisha would never have had compassion on me for all the impassioned strains in which I had sung the witchery of her black eyes. It was pity that made her conscious of the love that perchance had long lain hidden at the bottom of her heart.

Just as I was moving to the window, the prison door was softly unbarred, and, looking in that dark place like a diamond in a coal mine, she appeared followed by one and trusty old servant. The falling shades of night half concealed the beautiful outlines of her unveiled face, but I could see that her black eyes were flashing with excitement, indignation and, as my heart whispered to me, with a tenderer but still stronger feeling. She had always been of a gentle, yielding disposition, and, unless her heart had been deeply moved, she would never thus have acted in defiance of her father's will.

"Flee" she cried out to me. "My wicked father, *alas* that her daughter should say so, meditates thy death. Had I not heard it with mine own ears, I could not have believed him guilty of such cruelty."

On saying these words, she dimmed the lustre of her eyes by shedding a flood of tears.

"That window" I replied "affords the means of escape from prison, but not from death. No

one issuing from it without wings can hope to reach the ground alive "But no matter" I continued "with those gracious words of thine in my heart I can die happy."

"Nay, I had forgotten, simpleton that I am" and turning to her attendant she said "Juli, bring forward thy burden"

And the old woman came forward and placed in hand a long rope of woven silk and a sword

"With the rope thou canst descend from the window" said Aisha, "with the sword thou canst defend thyself against thy enemies, as I know well by trial. Would that I could also give thee a boat to cross the swollen stream, of the great river that bounds my father's domains. But lose no more time in words. I must return and my absence may be noticed"

So before I could say another word, she slipped away like a flash of light from the darkness of my prison chamber.

There was now nothing more to detain me. I girt the sword on my waist and fastened the rope firmly to the small bed of strong teakwood, the only piece of furniture in the room. The other end I let out through the window till it dangled down to the ground. I then squeezed myself through the window, slid down the rope and in a moment was standing safe and sound below the precipitous cliff on which the castle wall was built. My escape was however only partly achieved. The black clouds above me foreboded a terrible storm about to burst. Before me roared the swollen stream of the Amu Daria, which had swept many a man before me to Paradise on Iblis. Beyond it lay freedom in a barren mountain region over which my uncle had no dominion.

Choosing the spot where the river was deepest and therefore least tumultuous, I plunged in. The snow-fed stream was bitterly cold, but fortunately my frame had been trained to bear all extremes of temperature. The current was so strong that it carried me far below my starting point as if I

were one of the uprooted trees that it bore helplessly along. But all the while I was steadily making my way, with many a rebuff, first to the middle of the stream and then very slowly to within measurable distance of the southern bank. At last, when almost spent with the hard struggle, I espied before me a backwater. Could I reach it, my safety was assured. Putting all my remaining strength into my strokes, I headed for it, when suddenly there loomed on my left a great log of wood, which struck me violently on the side of my head. I knew no more till I found myself lying high and dry on the river bank.

When I opened my eyes, though the intense cold was freezing my wet garments and the snow was beating in my face, it seemed to me that I had never lain on a softer couch. Such was the feeling of perfect repose that filled my soul after the exhaustion I had undergone during the buffeting of the waves. As my senses slowly returned, I became conscious of a kind face bending over me.

It belonged to a man in the prime of life and in the garb of a warrior. He was above middle height and his form and bearing indicated great strength. From the length of his arms he would probably be a formidable opponent in sword play. His bow, arrows, shield and head-piece lay on the ground near a powerful black charger of the Turkman breed. I noticed that his body, armour and his raiment were dripping with water.

"Who art thou" he asked, "who darrest to swim across that angry flood" and he pointed to the swirling water a little below. "Was it pleasure or fear or disappointed love that prompted thee to attempt such a feat? Nay tell me nothing now but only let me know where thy home is, that I may take thee there 'out of the storm that is coming. Perhaps thy friends will give a night's shelter to me also, who have long

been a lonely wanderer half-famished on these cold barren hills."

As with the stranger's help I struggled to my feet, I told him briefly that I was a fugitive driven by cruelty and oppression from the home of my fathers.

"Then" said he, "unless the All Merciful has pity on us, it is an even chance that ere morning we may both be buried in the snow. For this part of the country is new to me and I know no place where we can take refuge from the storm."

There was indeed good reason for his fears. The snow was falling heavily and doubling the darkness of the night. Something must be done for dear life's sake, but what? Suddenly my dozed senses cleared up.

"Close by there is a cave where we can obtain shelter" I cried, "Quick let us hurry there, before the snow blots out every track."

He bade me mount on his horse and lead the way. I remonstrated. But my remonstrance was in vain for indeed my companion seemed to be one of those whose wills are not easily withstood. So he picked up his weapons and led me mounted on his horse in the direction I indicated. After one or two false turns, which I would never have made but for the blinding snow, we arrived at the mouth of the cave and entered in.

It was a refuge to which I had been in the habit of retreating in the company of my foster brother. My uncle, out of fear and jealousy, had refused to give me the education befitting a young man of my birth and, but for my foster brother's tender care, I should have merited the opprobrious epithet of 'the Dolt' which was sometimes given me. Indeed by his advice to save my life I found it necessary to feign simplicity and conceal as much as possible my love of weapons and knowledge of their use. It was supposed that I was wandering aimlessly on the hills all the time that I was learning secretly in

the cave the use of sword, spear, and bow from my foster brother, whose skill in the use of weapons could hardly be matched from Samarkand to Delhi. It so happened that a short time before my imprisonment an attack made by robbers on the escort of my cousin, Aisha, had compelled me to take an active part in her defence in which I showed at least that I was neither a coward nor a weakling. This excited my uncle's suspicions that I was not quite what I seemed, and soon after that incident my contemptuous treatment of Abul Hassan, the bridegroom chosen for Aisha, led to my being cast into prison as narrated above.

Before he died and left me alone in the world, my foster brother besought me to keep the cave always provisioned as a convenient hiding place, in case my life should be threatened in the castle of Dir. Thus it was that the place had a good store of firewood and grain. I lit a fire while my companion attended to the wants of his good steed. We then took off our wet garments and, wrapping ourselves in warm sheepskins, sat down before the fire to discuss the situation. When I told him my name and my story and how dire necessity had driven me to practise dissimulation, he did not blame me for my conduct. He himself, he said, would long ago have been at the mercy of his enemies, if he had not occasionally bent before the storm of dangers that encompassed him.

"But now that you are a man," he went on "and have shown your manhood by breasting the black waves of Amu Daria this wintry night, I bid you gather together a few faithful friends and face the oppressor sword in hand."

When I thanked him for saving my life and asked him how he had fished me out of the water, he made little of the matter.

"It is my practice" he replied* "winter or summer to swim every river in my path. I watched these swimming manfully till the log

* See Baber's Memoirs. p. 406.

struck thy head and then I jumped into the backwater and pulled thee ashore. We are now quits, for hear how the snow storm rages without. Had I not met thee, the Afghan eagles would be picking the bones of me and my horse to-morrow morning."

For three days and three nights we were snow-bound. We passed the time in martial exercises varied by the recitation and composition of Turki verses; for we were both devoted to the art of poetry. Aisha and my despair at the prospect of losing her inspired me with many a strain which at least expressed heart-felt emotion. My companion's favourite subjects were his own adventures in the past and his hopes of the future. The prophets had, he said, declared that he should one day wear an imperial diadem. The *huma** bird, of happy omen had been seen hovering over his head while he was yet a boy.

"Yet" he added "*since I was a boy of fifteen, my life has been a continual struggle, in which I have lost more lands than I have gained. But in the end my destiny must be accomplished. If driven from our native soil, let us go far to the East and win an Empire in China, as Changia Khan, my ancestor, did three hundred years ago. As he spoke these words, he looked every inch a king and born leader of men, under whose rule any one might be proud to live or die. I knelt at his feet and devoted myself to his service, exclaiming*

"To thee I owe my life and I swear by the Holy Book to be your faithful servant even to the death."

Then at last he told me who he was, Baber, born to the kingdom of Fergana and once by conquest the occupant of the throne of the great Emperor Tamerlane at Samarkand. From his boyhood he had undergone the strangest vicissitudes of fortune alternately gaining kingdoms by

his valour and losing them by the adversity that continually dogged his steps. He was now at the very lowest ebb of his fortunes, a dethroned fugitive parted from his trusty followers to evade the pursuit of his enemies and making for Kabul, one of the many central Asian kingdoms over which his ancestors had reigned.

At last the snow began to abate and we prepared to take our departure. On the morning of the fourth day as we looked out from the mouth of the cave we saw dimly in the distance the figure of a horse and something above it, that flashed in the light of the sun rising behind us. It turned out to be an armed cavalier who was coming our way followed by a troop of twenty or thirty men. We drew back to the shelter of the cave to watch them as they advanced nearer and nearer. Suddenly Baber recognised one of them and called out in a loud voice

"Dost Nasir, it is I. Who are these with thee?" This was one of the many turning points in the career of Baber. Dost Nasir brought with him a deputation of Mughals offering him the throne of Hissar and Kunduz, which he accepted. But it is truly written by Sidi in the Gulistan that

"The man of God, when he eats half a loaf, Divides the other half among the poor and needy. If a King subdues a whole Kingdom, may a climate, Still, as before he covets yet another."

Baber immediately used Hissar and Kunduz as stepping stones to the throne of Kabul, just as afterwards he employed his kingdom of Kabul as a stepping stone to the conquest of an Empire in India.

When Baber signalled his new monarchy by taking the title of Padishah, he conferred on me a rich robe of honour and a large estate near Gharni in recognition of what he was pleased to call my valuable services. I had indeed had my full share in the hard fighting that took place before my leader's authority was recognised by the turbulent mountaineers of Afghanistan. Nor did he forget my private affairs. One evening we were strolling

* The *huma* is a fabulous bird. Any head over which it hovers is fated to wear a crown.

body fell behind the seat and there he lay motionless with his great bare feet supported by the embroidered cushions, an object of derision to all present. *Whether from fear or drunkenness, he seemed unable to regain his seat.*

His followers who were in the hall, though contemning him in their hearts, drew their swords to avenge the insult done to their master. At the same time my men threw off their disguises and suddenly shone in the lamp light a company of picked warriors. Hard fighting and bloodshed would have ensued, but for the conduct of my uncle's retainers. On suddenly beholding their chief's nephew whom they supposed to be dead, they raised a shout of joy and so made it evident what side they would take, if swords were crossed.

While each party stood on the defensive and the drunken bridegroom still lay senseless or at any rate motionless on the floor, I coolly removed my rival's feet, took the vacant seat by Aisha's side on the nuptial musnud and bade them call upon the Qazi to come in with his witnesses and sign a new contract of marriage between myself and Aisha.

At this point two old advisers of my uncle intervened and remonstrated against such a high handed proceeding. They proposed to go to my uncle's sick chamber, relate what had happened and ascertain his wishes. As I had reason to believe that the grey beards were friendly to me in their hearts, I made no objection.

My uncle on hearing the story of my sudden reappearance and giving due weight to the fact that I was high in the favour of the great Padishah of Cabul bowed to the inevitable.

"I knew somehow all along" he said "that I was fighting against fate in my efforts to prevent the marriage of that nephew of mine and Aisha. Let them be married as soon as you like and leave me to die in peace."

Saying which he turned his face to the wall and after a few days sought the mercy of God.

WOMAN AND PATIENCE.

BY

MILLIE GRAHAM POLAK.

FROM time immemorial, the beautiful patience of woman has been so extolled, and placed as the crown of all goodness, that one would almost imagine that it is the only virtue for which she should strive, and that in its attainment she will achieve her highest destiny. But what do we mean by patience? Thinking women of to-day are beginning to feel that the exercise of mere blind patience has been rather a great wrong done to, than a benefit conferred upon, mankind. It has not helped forward the race, nor has it advanced woman herself to a higher status. That is largely because women, as well as men, have failed to realise that virtues, to be of service, must be constructive; they must have a positive, or active side, as well as a negative, or passive one. Mere endurance, abjectness, or apathy, is hostile to the first principles of true non-resistance. The old adage, "What can't be cured, must be endured," should be given a literal and not an extensive interpretation, for what can be cured ought never to be endured. This is the first elementary truth of life, and in so far as both men and women have failed to recognise it, they have not begun to understand the full meaning and capacity of life.

Most, if not all, civilizations of historic times, have held up, as an ideal for women, the forgiveness of sin, when the sin is perpetrated against themselves or their sisters. But with our knowledge of the real facts of life, can we rightly believe that lasting good has been the outcome of the adoption by women of such an ideal? Are not the same wrongs done them to-day, without shame, by the men who impose upon them this one-sided standard? I am not here attempting to plead the cause of woman's suffering, but rather, to

I desire to bring to conscious thought the part that women must play in the regeneration of a nation, a race, or a people. It is a platitude, now a days, to say that no reforms can become effective without the intelligent consent and co-operation of women. It follows, therefore, that evils will not cease to exist merely by women's patient endurance of them. Apart from what we of today call culture or education, women must cultivate and possess definite ideals, based to some extent upon definite knowledge of the life around them. Their mental processes must be founded upon the eternal principle, "Whatsoever ye shall sow, that shall ye also reap"—a law applying not to themselves alone, but also to those they love. They must deliberately set their face against evil; they must not blindly ignore it, and vaguely think that because they refuse to see it, it will cease to exist. It is a common, but it is also a foolish and false, belief that ignorance is innocence. Ignorance, whether real or assumed, is a crime against Nature, who demands that we shall possess full knowledge of her. It is a noble and beautiful ideal that the heart of woman should be filled with love, that she should be merciful, and welcome back the repentant sinner, but this must be accompanied by an absolute condemnation of the evil itself, and not by a condonation of it. Not different, but, loftier concepts of conduct are needed, both for men and for women. The true happiness of mankind is delayed each time a woman presents a patient and unreproachful face when her heart tells her a grave wrong against herself, and so against humanity, has been, and is being, committed. Infinitely better is it, to present a wisely loving countenance, having in her eyes knowledge of the evil standing in the path by which mankind is seeking its fulfilment.

Karma does not cease because of the forgiveness of sin. The evil act will bear its own fruit, which must be accepted and recognised as the natural seed of evil, and not rejected as an

unmerited and chance sorrow. The parents' evil characteristics are almost always reproduced to some extent in the child, and the child predisposed to wrong-doing and taught by custom to demand, as of right, forgiveness of its faults, a wiping out of its past—as though it were possible to wipe out the past—does not learn a higher or better state, or to control its weaknesses. Mothers, who leave their children under the illusion that wrong actions are not inevitably followed by their natural consequences, do them an irreparable injury. The children's logical faculties are destroyed, and their sense of justice is aborted.

Women must determine that, however limited may be the circle of their influence, it shall strengthen as well as soften. They must not tolerate evils and weaknesses in their own midst, but in so far as they recognise them, they are bound to make a corresponding effort to prevent their recurrence. It is not enough that women should be loving, they must be wise in their love; not enough that they should be patient in silent endurance, but also patient in condemnation. They do a grave injustice to posterity as well as to themselves, by tacitly acquiescing in and ignoring that which their hearts and minds condemn. Let it be at once understood that I do not in any way suggest or advocate retaliation, which has nothing in common with ethical resistance. The rendering of evil for evil is admittedly hurtful to all. It is not dignified, neither is it effective in the long run; but there is surely a *via media* between retaliation and blind acquiescence.

Public opinion, to day, does not in many places, allow a man to beat his wife, his grown-up daughters, or his sisters; but it would be a mistake to suppose that he in whom these brutal instincts prevail—and such instances are not by any means infrequent anywhere in the world—refrains from giving reins to them because of the patience of the women subjected to his brutality, but because he is afraid of the con-

sequences, whether they be legal, or the result of public contempt and condemnation. In domestic life, some of the worse traits of a man are often shown and tolerated. The brutality he may not reveal elsewhere, the tyrannical overbearing, the refined cruelty of neglect, the sneering contempt of what he imagines to be a woman's world and views of life, have been, and still are being patiently suffered by the woman, who accepts it meekly as her lot, and thus the wrong persists. The very virtue of patient endurance, that has been held up to her by man as her ideal, has been used by him to her detriment, her very silence and self-repression has been taken for weakness, until she herself has long come to believe it to be so.

It is, however, useless to attempt to apportion the blame for this sorry state of affairs. Women must set to work to develop themselves, and to undertake consciously and seriously their proper share of the world's work. It is not enough that women should be the bearers of the race; they must also set the standard of conduct and of life. But they must first seek the Kingdom of Heaven within them; they must seek within for the secret meaning of the duties and privileges of their own lives. So long have they been required to take to themselves most of the pain of life, so long have they accepted this one-sided ideal of blind acquiescence and endurance, that to-day more than half the world believes that it is man's nature to err and woman's to forgive. Few things are so calculated to upset a man's chosen theory of his position in the scheme of existence as the questioning of his actions by his wife or his sister. The very canons of conduct of men and women are set by man-trained or man-controlled woman. It is the masculine view of life that prevails, to the almost complete exclusion, or at least subordination, of the feminine aspect. The standard of life that man has set towards himself for his women-folk

is that they shall be ignorant of his follies or vices, or, if not ignorant, they shall believe them to be good or natural—to him almost, the same thing—or, if they cannot do this, they must forgive unquestioningly. So completely and effectually has this theory been thrust upon them, that the majority of women have almost ceased to feel; their minds have become so warped, that it is often difficult for them to distinguish right from wrong. And for all but the brave few, not to think is so much easier; not to worry, but to believe that God will give the credit for good intentions, though they have shut their eyes and ears and minds, or that they will be considered holy, because they have suffered uncomplainingly, without a word of protest or warning, and thus allowed to be perpetuated wrongs that definite and concrete thoughts and actions of theirs might have righted. Patience becomes a vice, when by inaction a wrong is suffered to continue without a word or look of protest. Such patience does not make things really brighter, except apparently for the wrong-doer, to whom, however, it offers but a temporary relief, whilst actually, it emphasises the wrong. So the sum of misery and human suffering grows, helped on by the very women who think they are serving noble ends. Purity of life is far greater than mere nescience, the silent acceptance and condonation of evil action, or the blind negative patience that helps no one. The great Masters of life have shown us what positive patience means—something far removed from that invertebrate mental condition common to the rank and file of women; something that serves and fulfils the purpose of mankind.

Some Factors in Large Crop Production

BY

Mr. S. SINHA, M.R.A.S. (Eng) M.A.S.A. (U.S.)

WE have been hearing a great deal about the improvement of Indian farm crops, and as a people we are just waking from our long sleep. Many of us have come to this country to study agriculture, and many have gone back after visiting American Experiment Stations. How far they are trying and have been successful in introducing improved methods of crop production they themselves will answer. The writer in this article intends to describe briefly some of the underlying principles of crop production culled from various experiences.

TILLAGE

The question might be asked "Is plowing an art?" It certainly is. Can we still call it an art when done by the native wooden plows? Is it likely that a man would be favourably impressed by the way the ryot turns the plow? In ninety cases out of one hundred it does not; now how are we going to improve? One great improvement will be effected in the use of iron plows, and plowing straight in such a manner that strangers passing the farm will be attracted by its neatness. Good plowing is profitable; if a fair crop can be obtained with poor plowing, a better crop can be obtained with good plowing. Thorough tillage with improved field machinery is one of the most essential factors in successful agriculture.

ROTATION OF CROPS.

Crop rotation means a certain succession of crops which regularly repeats itself each time the course is run. It means further that the crop follows each other in such an order as to insure each having such supplies of plant food of such a character as to aid in securing good returns from each particular crop. A good rotation will include:

1. Legume, meadow or pasture
2. Root or corn.
3. Some cereal crop.

Various combinations of these three classes are possible, and the natural aim of experimental work with rotation will be,

1. To determine the comparative values of the rotation as soil improves.
2. Their relative suitability for different lines of farming

In our country, farms differ in size, farmers differ in knowledge and skill, crops differ, seasons differ, prices change. Under these circumstances every farmer should adopt the crop rotation best suited to his own special conditions.

Land should not be kept continuously in the single crop; if so kept, the yield will be low; whereas in the rotation series the yield will be increased, and if a liberal dressing of farm manure be added a remarkable increase will be usually expected.

Experiments have further shown that crop rotation alone has not been sufficient to maintain the fertility of soil. Let us turn to the records of the Illinois Experiment Station where we have the results of a rotation field started thirty-one years ago. Dr. Smith* of the University of Illinois writes "In a three year rotation of corn, oats and clover, the average of the last three corn crops amount to fifty seven bushels per acre. The same system started sixteen years later (the land being in pasture in the meantime) on another part of the same original field gave in these same three years sixty four bushels per acre. By this comparison we see that the old rotation field is declining in yield having gone down seven bushels per acre by reason of its being sixteen years older. Although it may be true that statistical averages would appear to show that the production of a country can be maintained over considerable periods of time, we find that wherever

* Second Annual Report of Ohio Corn Improvement Association,

In further experiments conducted at Indiana, Ohio, Tennessee, an average increase of 38 bushels of wheat per acre was secured by sowing large grains instead of small. Cob* reports tests of various grades of wheat kernels with respect to size, and concludes that large kernels give better yields of grain. It is generally true that the largest grains are the heaviest and high-yielders, so the farmers should sow nothing but large, plump wheat. The same is true of seed corn (maize). Williams† reports that the heavier ear in its ear row tests out-yielded the lighter during the year 1901-1903. Bringing this report down to 1909 these results continue to tell the same story, the average gain per acre for heavy ears during the years 1908 and 1909 was 1.93 bushels. Many other experiments have been conducted at the Ontario Experiment Station with each of the eleven different classes of farm crops, and the average results show that the large seed surpassed the small seed by 19.1 per cent for grain crops, 40.3 per cent for the rape, and 60.1 per cent for the root crops. It is evident from all these results that we will get high yield and marked improvement in quality by planting large and heavy seeds.

It is advisable to get the habit of running our seed grain through an ordinary fanning mill which is of use in blowing out the lighter seeds, in screening out the smaller and in removing weed seeds. Then only well cleaned, large plump seeds will be left. We would seriously urge each ryot to use such large seed well matured, and of strong vitality. If he has not got any good seed, purchase him the best seed, if it is impossible to purchase, select from the best that he has.

One of the best guides in making selection that we found both in Ontario and Illinois Experiment Station was the "score card." Score cards have been made for most of the farm crops and

fruits, the variety for each farm crop that is scored highest is selected for planting.

The following score card was used by the writer in June 1909 at the Ontario Experiment Station for preliminary selections of potatoes:—

Points.	Perfect Score.
1. Flavor	40.
2. Mealiness	40.
3. Appearance, (color)	20.
Total. 100.	

These potatoes were boiled before we started to score, and selections were made according to those that scored highest. During the time of final selection the shape of tuber, eyes and size were considered. The following score card is adopted by the Illinois Corn Growers' Association for selection of ears of maize:—

Points.	Perfect Score.
1. Uniformity of exhibit.	5
2. Shape of ear	10
3. Length of ear	10
4. Circumference of ear.	5
5. Tips of ear.	5
6. Butts of ear	5
7. Kernel uniformity	5
8. Kernel shape.	5
9. Color in grain and cob.	10
10. Space between kernel and cob	5
11. Space between kernel and cobs.	5
12. Vitality of seed condition.	10
13. True to type.	10
14. Proportion of shelled corn to cob.	10
Total. 100	

The members of this Association are held in strong pledge to select only the best types of corn. Each member, for example, must test his seed before sending it out to the brother farmers, and if less than 90 per cent fails to sprout, he must reject it all.

Let us make the score cards for the various farm crops of India, let us print them in various languages of India and distribute them to every child and parent of farm home, let us explain the

* *Agricultured Gazette* of N. S. Wales, 14 (1903) No. 2.
† *Ohio Bulletin* 212.

ryots why we gave "40" for flavor, and not "20", why we gave "10" for proportion of shelled corn to cob and not "5". With this sort of work we can arouse the country to the need of score cards and good seeds.

BREEDING.

When a variety has been selected and grown, we want to make it better; it then comes a question of breeding and improving the varieties we now have. This can be done by continuous selection. The improvement of races by selection is slight in one generation; if this be continued year after year, very marked results may come out in course of time.

In Burbank's methods selection plays the most important part; to attain this end, the largest number of variations is prerequisite; such variations can be induced by crossing or hybridization. By crossing we will get all kinds of combinations. This will give us a chance to pick out the most desirable, ideal type, discarding thousands of undesirable and imperfect plants. Crossing sometimes combines in the hybrid* the good qualities of the two varieties. As soon as the desired type is picked out, its improvement by selection should begin.

There is another method which is called "Composite crossing," by which we take the special characteristic from each variety, blend it with the one distinguishing character of each other variety into a new and distinct breed that possesses the merits of all. When we bring out a large number of variations by composite crossing, new and prolific types, are possible, and by selection of desirable types we can fix them permanently after several years of selection.

Dr. Hopkins of Illinois Experiment Station, the father of Corn breeder, and the founder of "Single-ear selection" has laid the foundation of corn breeding on a business basis. His principle is now adopted all over the corn-growing states.

* Hybrid is now commonly used to designate any cross.

Who knows but that it may be adopted someday in India also. He has bred corn not only for special characteristics but also for immense industrial purposes. His work to day ranks as a classic in American agriculture. The progress of plant breeding in America is the greatest and most important undertaking of the American people. When shall we awaken to the fact that progress in Indian agriculture depends chiefly upon the breeding of plants for each agricultural district? The sooner this is done, the better for India.

THE SYRIAN CHURCH IN MALABAR.

BY

MR. C. I. VARUGHISE.

THE Syrian Church on the Malabar coast, of which the Patriarch of Antioch who resides at Mardin in Kurdistan is the Spiritual Head, is, at the present time, passing through a crisis which does not find a parallel in its history which is said to date from the middle of the first century of the Christian era. The visit which His Holiness Moran Mar Ignatius Abdulla II the Patriarch paid to the Church more than two years ago, and which was completed in October last, is now regarded as contributory cause in opening a deplorable chapter in this once prosperous and progressive Church. Be that as it may, we find that the Church from its beginning showed a tendency to welcome any and every ecclesiastical or sect that came from the West, and that the connection which it fondly wished for, ever led to the splitting up of the whole body. Hence it was that Nestorian Bishops, Latin Missionaries and Jacobite Patriarchs found a tractable and obedient flock in Malabar, and almost every Christian sect now flourishing there claims to be the legitimate representative of the ancient Syrian Church, and for corroborative evidence, points to some one or other of the several Chris-

tian Missionaries as having preached or propagated doctrines that form the distinctive cult of that particular sect.

The Portuguese, on their arrival in India in the 16th century, came in contact with the Syrian Christians who applied to Vasco de Gama for assistance against their Mahomedan neighbours. One hundred years later the Roman Catholic Hierarchy, acting under directions from the Pope and calling in the aid of the Portuguese military power, succeeded in forcibly subjugating the Syrian Church to that of Rome. Cardinal Menezes Archbishop of Goa was the great mover in this aggression. On the 20th June 1599, he assembled the Syrian Christians at a Diocesan Synod which met at Diamper, and resolutions prepared beforehand by the Archbishop, and abjuring Nestorian errors, adhering to Rome, and reforming the discipline of the Diocese were accepted by the Syrian Clergy and laity present on behalf of the Church. The Synod over, Cardinal Menezes made a tour of the Syrian Church doing all in his power to rivet the chains of Rome on the Church he had enslaved. For nearly sixty years the ascendancy of Rome was maintained, although the Syrian Christians made attempts, from time to time to renew their connection with the Eastern Church. A Bishop sent to them at their request by the Patriarch of Antioch was taken prisoner by the Portuguese, carried to Goa, handed over to the Inquisition there, and, it is said, was burnt alive as a heretic in 1653. This act of Romish intolerance infuriated the Syrians who assembled at Mattancherry before the Coenen Cross outside the fort of Cochin, and took a solemn oath renouncing all obedience to the Jesuits. In 1663 the Dutch took Cochin, and although they showed no special interest in the Syrians, against whom their minds seem to have been prejudiced, they rendered them a good office by ordering all Romish Ecclesiastics, Portuguese Clergy as well as Italian Carmelites—to quit the country. This ancient Church was

once more free; but the price paid for the temporary union with the Church of Rome was the separation of a large party which still adhered to the latter, and is now known by the name of Romo-Syrians.

When the English took the place of the Dutch on the Malabar coast, the Syrian Christians attracted their attention, and in 1805 the Government of Madras sent the Rev. Dr. Kerr, senior Chaplain of the Presidency to investigate the state of the Syrians and other Christians in those countries; Dr. Kerr did not go below the surface and his report throws no light on the history of these Christians. In 1806, Dr. Claudius Buchanan, a Chaplain in Bengal was, for the purpose, commissioned by the Marquis Wellesley, and he visited Travancore and made a tour among the Syrians. In his work he received the cordial co-operation of Colonel Macaulay, the first British Resident of Travancore, and on his return to Europe, published in 1811, his "Christian Researches in Asia," a book which excited the liveliest interest among Christians in England respecting the Syrian Church. One practical result that followed was that the Church Missionary Society, at the invitation of Colonel Munro who succeeded Colonel Macaulay as Resident, undertook a mission to the Syrian Church and in 1816 sent out four English Missionaries (This was the origin of the Anglican Church in Travancore and Cochin). The object of the Resident, the Society and the Missionaries was to aid the Syrian Church to reform itself, and while doing so to abstain carefully from any interference with the liberty of that Church. For a few years, the Missionaries carried on their work with strict fidelity to these principles, in course of time, however, it became evident that the Syrian Christians as a body were not yet prepared for reform. The teaching of the Missionaries clashed with the ideas of men who had a conservative liking for the ritual of this Oriental Church. In 1835 Bishop Wilson of Calcutta during his primary

visitation came to Kottayam where he had an interview with the Syrian Metropolitan Mar Dionysius IV., and efforts made by him and others to induce him to take steps for the reformation of his Church proved fruitless. Two years later, the Metropolitan broke off all connection with the C.M.S. Missionaries and declared that his Church was in communion with the Jacobite Patriarch of Antioch. Although the Syrians, headed by their Bishop had thus formally parted company with the Church Missionary Society, the teaching of the Missionaries for more than twenty years had not been without result, and there was among the Syrians a party influenced by that teaching. Some of these openly abandoned the Syrian ritual and became members of the Anglican Church.

Those Syrians who had been influenced by the teaching of the missionaries but who remained Syrian, formed themselves into a party opposed to the Metropolitan. They sent a young Deacon with credentials to the Patriarch who consecrated him as Bishop and sent him back to Malabar with his written appointment as Metropolitan. The new Metropolitan landed in 1843, assumed the name of Mar Athanasius, and claimed his Bishopric from the Metropolitan then in power Mar Dionysius IV., who refused to move, as he had the support of the Government, and was in possession. The latter then sent memorials to the Patriarch saying that the Patriarch had been deceived, that Mar Dionysius was submissive to the Patriarch and that Mar Athanasius was one of the party inclined towards the C.M.S. Missionaries. Thereupon the Patriarch in 1846 sent his Secretary Mar Cyril to this country with full powers, and the Patriarch gave the Secretary a set of blank papers already signed in order that Mar Cyril might have power to issue a decision in the Patriarch's name. On arrival in Travancore Mar Cyril joined Mar Dionysius and reported in his favour. To drive Mar Athanasius from the field,

Mar Cyril filled up his blank papers with an appointment of himself as Metropolitan of Malabar. The Travancore Government appointed a Committee to report whether the credentials of Mar Athanasius or those of Mar Cyril were genuine. The Committee reported in favour of Mar Athanasius who was then placed in office and Mar Cyril was ordered to quit the country. Mar Cyril, after a few years, again made his appearance and raised up a party against Mar Athanasius. Acting upon a Proclamation issued by the Travancore Government in 1863, that those who wished to follow Mar Cyril were at liberty to do so, but that they should build for themselves separate Churches and leave the adherents of Mar Athanasius in peaceful possession of existing ones, Mar Cyril filed a lawsuit which was conducted for him by a priest at Kunnamkulam. Defeated in this effort, Mar Cyril in 1865 sent this priest to Antioch, and the Patriarch consecrated him as Bishop. This Bishop returned to Malabar the following year, took the name of Mar Dionysius and claimed the office of Metropolitan from Mar Athanasius. The Patriarch, at the request of Mar Dionysius visited Malabar in 1874, and two years later at Mulanturuthu presided over a mass meeting of his adherents which passed resolutions against Mar Athanasius.

In accordance with the instructions issued by the Secretary of State, the Travancore Government on the 4th March 1876 issued a proclamation that the Government abstained from any management of the Syrian Church and that claims to appointments or to property must be tried in the courts of law. Mar Dionysius accordingly on the 4th March 1879 filed a suit which lingered in the Courts for ten years and in 1889 the final judgment was pronounced in favour of Mar Dionysius. He was then placed in power and Mar Athanasius and his party were ousted. This party remains as a body entirely separated from the Jacobites and

is known as the Mar Thoma Syrian Church. Thus the first recorded visit of a Jacobite Patriarch and the legal establishment of the supremacy which he had but nominally over the Syrian Church in Malabar resulted in the separation of the present prosperous Mar Thoma Syrian Church.

History repeats itself, for in the present struggle of the Syrian Church we see the repetition of all that had taken place thirty years ago, only in an intensified degree. But we must differentiate the one from the other. Then the party of Mar Athanasius contended that although after the breach with Rome in 1653, this Church received in 1665 Episcopal orders from the Jacobite Patriarch of Antioch, the Syrian Church in Malabar ever remained an autonomous Church with a custom that each Bishop consecrated his successor, and that the consent of the Patriarch was not required for the regular consecration and for the due succession of Bishops in this Church, while the party of Mar Dionysius contended that this Church was always under the Patriarch who was the only authority competent to consecrate the Bishops. Now both parties maintain that it is dependent on the sees of Antioch; but the question at issue centres round the power of the Patriarch over the Malabar Syrian Church. Here it must be remembered that over thirty years ago the supremacy of the Patriarch was made the subject of the great Civil suit between the two rival factions of the Church at the time, and that the Royal Court of Final appeal in Travancore decided that the Ecclesiastical supremacy of the See of Antioch over the Syrian Church in Travancore had been all along recognised and acknowledged by the Jacobite Syrian community and their Metropolitan, that the exercise of supreme power consisted in ordaining, either directly or by duly authorised Delegates, Metropolitans from time to time to manage the spiritual matters in the local Church, in sending *Morons* (Holy oil) to be used in the

churches in this country for baptismal and other purposes, and in general supervision over the spiritual government of the Church, and that the authority of the Patriarch had never extended to the government of the temporalities of the Church which in this respect has been an independent Church. The Pro Patriarch party argues that as one cannot draw a line between the spiritual and the temporal matters of the Church, the Patriarch is practically the Head in every respect as he has been acknowledged to be from the first, while the party opposed to the Patriarch tries to limit his power to the consecration of Bishops for the Church and to the supply of holy oil, for which he receives his fee in the shape of *Recesses* the poll tax paid by every grownup member. It is true that in the white-heated controversy which had been arrived on during the period, much extraneous matter has been brought into the principal question which has only complicated the issue and rendered the situation worse. Here I do not mean to enter into a detailed account of everything that has happened since the Patriarch set his foot on Travancore soil, which is reserved for a history of this dark period, and to distribute the blame between the parties, suffice it to say that much dirty linen was washed in the public and that the doings of those from whom better things were expected, do not reflect credit on them. I know that there are on both sides many good men who sincerely wish to see the struggle brought to a speedy termination. The struggle is no insignificant one. Its magnitude defies description. Its seriousness staggers contemplation. And the author of the article, once a member of the oldest Church in India now earnestly appeals to one and all who have the welfare of the Jacobite Syrian Church in Malabar at heart to come to its rescue and avert the impending doom; for a split in the Church seems inevitable as there had been on previous occasions.

THE OXFORD MILLENNARY.

BY

THE REV. ARTHUR R. SLATER.

THE celebration of the millenary of any city is an event of unique importance, but the City of Oxford holds so commanding a position in the intellectual life of the country that the preparations made for the celebration of that event in its history are of more than passing interest. There is scarcely any city, save London, that so strongly attracts the Indian student. He looks upon it as the centre of English learning, and to complete his education by a course at this University town, is increasingly becoming an ambition. By virtue of its long history, its illustrious scholars, its culture, Oxford, in spite of the founding of many other universities, still retains a strange attraction, and today is more prosperous than ever in its history. It is true that not all the famous men who resided within its walls spoke favourably of it, for the manner of life was not calculated to appeal to every nature; but the majority unite in offering their praises to the place which has done much toward the development of their characters and which prepared them for the high and responsible posts they afterwards held in the service of the country. Of all the great who presented their laurels before their university none bore a stronger love, or expressed with greater felicity that admiration and affection than Matthew Arnold. In his two poems, "The Scholar Gipsy" and "Thyris" he has expressed his passion for the city and its surroundings; in his essays on "Sweetness and Light" he says, "Oxford, the Oxford of the past, has many faults; and she has paid heavily for them in defeat, in isolation, in want of hold upon the modern world. Yet we in Oxford, brought up amidst the beauty and sweetness of that beautiful place, have not failed

to seize one truth—the truth that beauty and sweetness are essential characters of a complete human perfection. When I insist on this, I am all in the faith and tradition of Oxford. I say boldly that this, our sentiment for beauty and sweetness, our sentiment against hideousness and rawness, has been at the bottom of our attachment to so many beaten causes, of our opposition to so many triumphant movements. We have not won our political battles, we have not stopped our adversaries' advance.; but we have told silently upon the mind of our country, we have prepared currents of feeling which sap our adversaries' position when it seemed gained, we have kept up our own communications with the future." Gladstone never missed an opportunity of paying a tribute to his university city, and in one of his speeches he said, "There is not a feature or a point in the national character which has made England great among the nations of the world, that is not more strongly developed and plainly traceable in our universities. For eight hundred or a thousand years they have been intimately associated with everything that has concerned the highest interests of this country".

It is not surprising that the authorities of the city and the university should have decided to commemorate the millenary of a city which has so gripped the imagination of the English-speaking world, and the arrangements made seem to be in keeping with the main object of the university, i.e., the spread of education. While the celebrations which began on the 11th of June will not be lacking in spectacular effect, the authorities are determined that they shall be the means of presenting in a striking and effective form the main events of the history of the city, and to this end the services of the ablest historians of each period have been enlisted. The tableaux will be accompanied by dialogue, prepared by several leading novelists, and special lectures will be delivered by the professors on events of interest.

The many and varied objects of value in the Ashmolean Museum and the archives of the City Corporation, are to be on view, and descriptive accounts will be given of them. There can be little doubt as to its success for the "town and gown" are equally enthusiastic. The purport of this article is to represent briefly some of the main features in the development of the city and the university. Oxford usually conjures before one's eye the vision of colleges, undergraduates, lecture halls, degrees and gowns. But it is necessary to remember that, while the fame of Oxford is based chiefly upon its position as an educational centre, it has a political history which, of itself, is of sufficient importance to merit study. Before attempting to trace the growth of the university, perhaps a brief resume of the leading political events of the period may help to make clear the importance of Oxford as a political centre.

This year is recognised as the millenary of the city because the first authentic reference to Oxford is to be found in the Saxon Chronicle of 912 A. D. which recorded that Edward, the son of Alfred took over the castle and city from the widow of Ethelred, together with all the land obedient to the city. Though this is the first recorded event in the history it is apparent that there existed, previous to this date, a town of some importance. Its position on the river Thames rendered it valuable as a fortress. While in power the English commenced a large system of fortifications, and the present existing castle mound now enclosed in the grounds of the jail, is no doubt a part of that system. Troublesome wars followed and the English and Danes strove hard to gain the island. It is in connection with these wars that we find quite a number of references to Oxford, whose position made it a strong defence against invasion and a place of parley between the two forces. The Norman conquest completely changed the country, and in Oxford the changes wrought are very

characteristic of the rest of the country. They had a stubborn fight with the defenders of the city, (witness the records of the time which reckon more houses rentless than rentable) and it was long before the Normans felt at ease. The strong hand of Robert D'Oli gradually produced order and the manufactures which had been interrupted were resumed but with an enhanced trade. A historian has pointed out that "no place better illustrates the transformation of the land in the hands of its Norman masters, the sudden outburst of industrial effort, the sudden expansion of commerce and accumulation of wealth which followed the conquest." New castle walls were built and the old churches and monasteries were restored.

The next political event of importance was that attempt on the part of the heroic Simon de Montfort to claim some share in the government of the country for the people. Henry refused to listen to the grievances of the nobles but lack of means to carry on his government forced him to submit to their demands. The nobles demanded the appointment of a Committee of twenty-four to draw up terms for the reform of the State. The "mad parliament" which drew up these provisions met in Oxford in 1258, and thus laid the basis for that form of government known as constitutional which is one of the great assets of the English nation. From this time the city gradually sunk in political importance while the university steadily increased. There was, however, an event that made the city rise to its old position. Charles the First was forced to flee from London and Oxford was chosen as the place of his Parliament. For three years he held on to the city, and made desperate attempts to overthrow the Parliamentary army. The city was finally besieged by Fairfax and captured by him in 1645. His son Charles afterwards held a brief parliament here, but it failed to accomplish anything. These few facts show

That this form of punishment was frequently used is evident from the records, and that it was considered a very essential part of college discipline is apparent from the strong support given by the founders of the various Colleges in their regulations. It would seem that this kind of punishment disappeared toward the end of the seventeenth century, for there is no mention of it in the statutes of the Worcester College founded in 1698. While it was not forbidden that a student should speak to a woman within the College grounds it was deemed advisable in the Peterhouse statutes to restrict, as far as possible, the grounds to the men. If, however, the students found it impossible to find a man to wash the clothes, a laundress might be procured, but "she must be old and of unprepossessing appearance." When these institutions were founded the donors were not thinking of the poorest classes for, according to the statutes, they frequently provided only board and lodging, the other necessities of life being procured elsewhere. The long course of study, the limited provision made by the donor, the insistence on his kinsmen attending the colleges, which denoted that in his mind the life was higher than that of an almshouse, seem to point to the fact that the aim of the founders was to provide a good education for respectable classes in exiguous circumstances.

Turning from the Colleges to the University itself, there is early in the thirteenth century, a trace of these later regulations which were found necessary to check the violence and evil ways of the scholars. By the fifteenth century the early liberty of the scholars and undergraduates had practically disappeared, and stringent rules had been introduced. Extravagant and unbecoming dress was forbidden; disobedience to the Principal merited public punishment on Saturday nights; if he gambles he is to pay fourpence; if he shouts or makes melody when others wish to study or sleep, or brings to the table an unsheathed knife, he

is fined a farthing, if he is pugnacious and offensive and makes odious comparisons, he is to pay sixpence.

The limits of this article forbid an account of the great influence on the teaching of the University exerted by the Friars in the thirteenth century. Their enthusiasm for theology led the students to a deeper study of religion from a scholastic point of view, while the introduction of the study of Aristotle, so long supposed an enemy of medieval faith, substituted an appeal to the reason for the blind obedience to authority. "By the critical tendency, by the new clearness and precision which scholasticism gave to enquiry that in spite of the trivial questions with which it often concerned itself, it trained the human mind through the next two centuries to a temper which fitted it to profit by the great disclosure of knowledge that brought about the Renaissance. The University of Oxford, which had fallen under the direction of their teaching, stood first in its resistance to Papal exactions, and its claim of English liberty". The period of the Reformation and the Revolution witnessed a great deterioration in the position of the University, but the great revival in the early part of the nineteenth century gave Oxford a new life. The examinations were reformed and made a reality; the statutes have been remodelled as the result of the commissions of 1850 and 1876; celibacy ceased to be compulsory; new branches of study, especially in the natural direction of natural science were opened; all restrictions on non-conformists were abolished; the privileges of Oxford were extended to women though they were not permitted to take degrees. These changes have transformed Oxford to a large extent, and has made it possible for it to continue to hold its place as the premier university in the country. In Arnold's day the university was in its full strength and influence and of it a writer could say, "Still the Oxford of 1853 breathed from its towers the last enchant-

ments of the Middle Ages; and still it offered to its most ardent disciples who came to it as some miraculous place, full of youthful enthusiasm, thirsting after knowledge and beauty, the strong welcome that Gibbon had found at Magdalen, that Shelley had found at the University in the days of the ancient order." The celebration of the millenary finds Oxford as great a centre of influence as ever in its long history

THE ANCIENT HINDUS.

BY

MR. A. M. SAKHAPATHI MUDALIYAR.

THE ORIGIN OF THE TERM HINDU

THE term "Hindu" is a corrupt form of the Sanscrit term *Inda*, which is one of the appellations of the Moon and which is derived from the root *Id* meaning "to have supreme wealth." The term was originally applied to the *Aryas* speaking the *Indi* or (as it is popularly known) Hindi dialect (the literary language of the upper basin of the Ganges locally known as *Hindustani*, the land of the Hindus) but is now applied in general to all the *Aryas* including the Dravida. How came one of the epithets of the Moon to be applied to the *Aryas*? Just as the Moon by her cool light illuminates the world and removes darkness, so the *Aryas* too by their traditional virtues and Vedic learning enlighten the world and remove ignorance. To indicate this characteristic of the *Aryas* they were metaphorically styled "*Indu*." This term is used in its plural form in the Atharva vedic expression '*Induḥ putarāḥ*' which describes the *Aryas* as the parental race. Why then is the *Arya* styled Hindu and not *Indu*? When the Persians invaded India and made her inhabitants captives they used them as domestic slaves and called them *Hindu*, which term in

Persian came to mean 'servant' or 'slave' much in the same way as the 'captive slave' to the German came to mean "slave." Western scholars, however connect the term Hindu with the river Indus.

THE ORIGINAL HOME OF THE HINDUS.

We depend for our knowledge on this point largely upon the traditions and legends preserved in the Rig Veda—the admittedly earliest known literature in the world. Though its secular hymns are so few, the incidental references contained in the whole collection are sufficiently numerous to afford materials for a tolerably detailed information regarding the two races who inhabited the Indus and the Gangetic valleys in that far off age. There is no satisfactory evidence to show whence, when and how these two races came into this country. They have not even a single tradition which points to any seat of their race out of India, or of their having migrated from any country with whose inhabitants they can claim any kindred. So far as they know, they are indigenous and aboriginal.

European scholars say that a race called the Dravida originally entered India through the passes in the north-west and was subsequently followed by another race called the *Aryas* and driven by them to the east and the south and that in the Rig-vedic period the *Aryas* first settled themselves in the Panjab and then began to make a move towards the east. Their theory, based as it seems to be, upon the analogy of the habitation of European countries, is that an *Aryan* race lived in the prehistoric period in the extensive Steppes of Central Asia and subsequently migrated, some into Europe, some into the Iranian Plateau and some into India. This theory, so far as Europe is concerned, has now been almost abandoned in favour of the Baltic or the Arctic theory, and, so far as India and the Iranian Plateau are concerned, is unable to meet the difficulty presented by the fact that the astronomy of

the Hindus, the Persians, the Egyptians and the Chinese was obtained "from the common source of an ancient people who already possessed a high degree of civilization." The celebrated Astronomer, Mons. Bailly, holds that Hindu Astronomy is "the remains rather than the elements of a science."

The large number of Rig-vedic mantras praying for an abundant downpour of the precious rain is attributed by the Western scholars to an early remembrance of the Arya of the feeling of cold during his residence in the temperate zone. It is indicative rather of the frequent occurrence of famine in the Rig-vedic period. Even now in times of drought, the Hindus make *japams* to the Gods praying for the rain. "Indian history," says Goethe, "has been too much the sport of credulity and hypothesis, inadequately checked by critical judgment of evidence or verification of facts."

The following verse of the Rig Veda declares that the Aryas and Dasyus were neighbours residing in contiguous villages :

"O Indra! around us are Dasyus. They don't perform Yajnas. They are unbelievers and are of Asuric nature. O Slayer of enemies! Slay these Dasyus".

The frequent references in the Rig Veda to the Indus and its six tributaries (or *Saptasindhavah* as they are called) as against the very few allusions to the Ganges and the Jumna show that the Dasyus made frequent raids upon the Aryan settlements in the north-west, just as the Afridis do at present in the North Western Frontier Provinces even under the British rule, and that the Aryas did not meet with any considerable trouble from the Dasyus in the Gangetic valley. This view receives confirmation from the fact of the river *Sarasvati* being called in the Rig Veda a stronghold, an iron gate, and thus forming, the real boundary between the turbulent Punjab and the quiet Madhyadesa. Why was the *Sarasvati* called a stronghold, an iron gate? Was it

because it checked the eastward movement of the Punjab Aryas? Or was it because it offered as a protection to the Aryas of Madhyadesa from the inroads of the Dasyus from the west? There is no warrant in the Rig-veda in favor of the first query. The safest inference is in favour of the second query. The Dasyus never attacked the Aryas in the plains. The Aryas who were settled peacefully in Madhyadesa were protected by the *Sarasvati*.

It is note-worthy that the name of the Ganges mentioned directly in one passage of the Rig Veda is not to be found in any of the other Vedas. The Rig Veda mentions *Kikata* (Magadha) as belonging to a tribe of Dasyus ruled by *Pramaganda*, and refers also to a rich and powerful prince called *Iksvaku* who, according to the Epic Ramayan, was the founder of the Solar race of kings of Ayodhya (Oudh). It is therefore conclusive, that in the Rig-vedic period the Aryas were settled as far as Magadha if not beyond. The following text of the Rig Veda is in point :—

What do your kine do in Kikata? They yield no milk for yajnas, nor do they illumine the fire. Fetch us the wealth of *Pramaganda*. O Indra! deliver the low man into our hands.

All countries beyond Aryavarta, which did not follow the four-fold caste system, were interdicted as *Mlechchadesa*—the land of the unclean—and their inhabitants as *Mlechchas*. Had the Aryas migrated from any other country, would they have called it *Mlechchadesa* and its inhabitants *Mlechchas* without the least patriotic feeling for their motherland and the least attachment for their primitive stock? That Aryavarta was the original home of the Aryas is clear from their calling it their motherland and holyland. Their rule was "that no one should go out of the sacred limits of this holyland and that life here and death here alone shall be the necessary conditions of gaining Heaven hereafter." The Hindu clings to the same ancestral fields during

many generations even when the family has grown too numerous to live upon the crops. Strabo mentions an ambassador from king Pandion to Augustus who met him in Syria. A Brahmin accompanied this ambassador to Athens where he burnt himself alive! Unlike the *Dravids* who had carried on a brisk warm trade with the Persian and the African coasts, the Vedic Aryas were always averse to emigration by land or sea, though they are said to have undertaken conquering expeditions and religious and political missions to other countries. Navigation in the Rig Vedic times is limited to the crossing of rivers by boats to reach the other bank.

Sir William Jones says —

Of the cursory observations on the Hindus, which it would require volumes to expand and illustrate, this is the result, that they had an immemorial affinity with the old Persians, Ethiopians and Egyptians, the Phœnicians, Greeks and Tartars, the Scythians, or Goths and Celts, the Chinese, Japanese and Peruvians.

How is this to be accounted for?

Manu says that the tribes of Kshatriyas named *Paundrakas*, *Odras*, *Dravidas*, *Kambojas*, *Yavanas*, *Sakas*, *Paradas*, *Paplavas*, *Chinas*, *Kratas*, *Dardas* and *Khasas* have gradually degraded themselves owing to their non observance of the sacred rites and their estrangement from the Brahmins. These Kshatriyas, as also the *Gandharas*, *Savaras*, *Barbaras*, *Tusharas*, *Kantaks*, *Andhras*, *Madrakas*, *Pulindas* and *Ramataks* were, according to the *Mahabharata*, people of different countries. In accordance with the advice of his spiritual teacher, Vasishtha, Sagara made the *Yavanas* shave their heads, the *Sakas* half their heads, the *Paradas* wear long hair and the *Paplavas* beards. These and other Kshatriyas being deprived of the study of the Vedas and the *Vashatkara*. In consequence of their abandonment of their proper duties and of their desertion by the Brahmins, they became *Mlechhas*.

"Great intercourse formerly subsisted between the ancient Hindus and the nations of the West."

Direct evidence of ancient commercial relations between India and the West has recently been found in the hieroglyphic texts of the 17th century. Referring to *Brāhmanavarta*, Manu says "Let mankind from the different countries of the world learn their own conduct in life from learned men born in this country."

The words *Kokila*, *Irdha*, *Padma* are, according to Silyans, foreign to Sanskrit, and the Vedic word *Uloka* seems to be a corruption of the Tamil word *Ulaku* which, according to the ancient Tamil author, Nachinarkiniyar, a Brahmin, is not of Sanskrit origin. The Greek terms *Oriza*, *Zinziber* and *Karpion* are almost identical with the Tamil words *Arusi* (rice) *Injiver*, (Ginger) and *Karuta* (cinnamon). The terms *Tulium* and *Kopi* occurring in the Hebrew Bible to indicate peacocks and monkeys are simple Indian words. It was only recently discovered that the English word *daughter* was derived from two Sanskrit roots meaning "to draw milk." The expression *Indaraj pitarah* of the Atharva Veda indicates that the Hindus were the parental race. A tradition amongst the Hindus runs that the ancient Rishis undertook religious missions to distant lands and taught the Vedas to the world, e. g. the *Znd Avesta* of the old Persians and the *Edla* of the old Scandinavians. To these processes the affinity of the languages and ancient customs of the West and the East must be attributed.

"The relation of the tiger to the lion in the Vedas" furnishes to Professor Macdonald "peculiarly interesting evidence of the eastward migration of the Aryans during the Vedic period." This inference is based on the fact "that the Rig Veda mentions the lion but not the tiger while in the other Vedas the tiger has taken the place of the lion which is, however, still known". This serves as a good example of the dangers of the *argumentum ex silentio*.

Professor Weber raises the following queries:—
"But what it was that led to the migration of

the people in such masses from the Indus across the Sarasvati towards the Ganges, what was its principal cause, is still uncertain. Was it the pressure brought about by the arrival of new settlers? Was it excess of population? Or was it only the longing for the beautiful tracts of H. India? Or perhaps all these causes combined?"

Oriental scholars well acquainted with the early historical traditions of the Hindus, the *Manusmṛiti*, the *Mahābhārata* and the *Puranas* do nowhere acknowledge the theory of the migration of the Hindus into India.

In spite of the above data, historians of India have drawn, to fit in with the Central Asian theory the curious conclusions that the Aryas spread over Northern India from west to east in the Vedic period and that the events of the *Mahābhārata* (which occurred in Panchala, Virata and Kurukshetra in the west) preceded those of the *Rāmāyana* (which occurred in the eastern kingdom of Kosala and Videha and Southern India) in point of time.

The Rig Veda makes no mention of the Vindhya and the country lying to the south of it. As early as the time of Sri Rameschandra, we find Rishis meditating in the Dandaka forest south of the Vindhya. It is related that the Vindhya bowed down at the command of Maharshi Agasthya to admit of his crossing them. The Brahmins that settled in the Peninsula are known as *Pancha Dravids* in contrast with those of Aryavarta who are styled *Pancha Goudas*, the former consist of the *Dravids proper* (the Tamils including the Namudiris who settled in the Western Coast at the instance of Parasurama), the *Andhras* (the Telugus), the *Karnatas*, the *Moharashtras* and the *Ghurjaras*, and the latter comprise the *Goudas proper* (the Bengalis), the *Utkalas* the *Maithilas*, the *Kanyakubjas* and the *Sarasvatas*.

The Dravids of the South had an old civilization with settled forms of government of their own.

We do not know when or whence these advanced Dravids spread over the plateau of the Deccan and the low-lying plains of the Peninsula. Here, as in the eastern portion of *Aryavarta*, a conflict of civilization took place; the superior civilization and the nobler religion of the Aryas prevailed. The Dravids never gave up their ancient tongues, Tamil, Malayalam, Telugu, Canarese and Tulu, which they still continue to speak. On the other hand, the Brahmins of the south did not wholly escape Dravidian influence and adopted the Dravidian tongues and customs. In fact Maharshi Agasthya was the first Tamil grammarian whose Brahmin disciple wrote *Tholkappiyam*—the most ancient grammar of highest authority now extant in Tamil. Here and there a few small and scattered Dravidian tribes far removed from civilization have not given up their primitive habits and beliefs.

THE CIVILIZATION OF THE ANCIENT HINDUS.

The civilization of the Ancient Hindus can be traced back to the Vedic age.

The ancient sages of India have transmitted their thoughts to posterity through the medium of the Sanskrit tongue which is still the medium employed by thousands of Sanskrit scholars, for many books and journals are still produced in this ancient language.

The Sanskrit alphabet represents all the sounds of the Sanskrit language in fifty symbols, arranged on a thoroughly scientific method, the simple vowels coming first, then the diphthongs and lastly the consonants arranged in uniform groups according to the organs of speech with which they are pronounced. This complete alphabet has remained unmodified from time immemorial.

Sanskrit scripts are of two kinds, the *Devanagiri* form adopted generally by foreigners as well as the Hindus, and the *Grantha* form in vogue in the Tamil country. The former script is recognizable by the characteristic horizontal lines at the top of the letters, while the latter script

borrowed many of its letters from the Tamil script without any change whatever.

In Northern India manuscripts have been written on strips of birch bark or palm leaves with ink and reed pen, while in the south they have always been scratched on palm leaves with a stylus, the scrawls being afterwards blackened with the juice of green leaves. These manuscripts are held together between thin wooden boards by a cord drawn through a hole or two and wound round them. Owing to the perishable nature of the birch bark and palm leaves, old manuscripts have become rare. Palm leaves went out of use in the north after the introduction of paper, but are still common in the south. Inscriptions have also been engraved on rocks and pillars or copper plates.

The Vedic rule that the Vedas are to be learnt by rote from oral instruction by a teacher merely prohibits the mode of getting up by reading from manuscript or printed matter and must not be construed to imply that writing was unknown to the composers of the Rig Veda. Learning by rote alone is accounted of value. Though the use of writing has been long in existence the native instruction to the modern Hindu is still based on oral delivery. Astronomical calculations were made for commencing or ending Vedic sacrifices. The elements of astronomy were laid down even before the compilation of the Rig-vedic mantras. The Rig-vedic Aryas must have been acquainted with writing to help them in making those calculations.

There are early traces of Sanskrit having had dialectic variations. As already observed, the words, *Padma*, *Arđha*, and *Kelila* are according to Sayana, foreign to Sanskrit, and the Vedic word 'Uloka' which has puzzled Dr. Max Müller seems to be a corruption of the Tamil word 'Ulaku' which, according to the ancient Tamil author Nachinarkuniyar, a Brahmin, is not of Sanskrit origin. Among the several

dialects of the Arya, Hindi is the most widely spoken in the North, the other dialects of the Arya being *Bengali*, *Behari*, *Guzarati*, *Kashmiri*, *Maharashtri*, *Punjabi*, *Rajasthani*, *Sindhi* and *Urya*.

Among the Dravids of the south, Tamil is an independent language with its own incomplete alphabet, though its literature is based on the Sanskrit model like those of its sister languages, Telugu, Malayalam and Kanarese, whose alphabets as well are formed after the Sanskrit model. Tulu is a widely spoken Dravidian dialect (with no literature) in a small area in South Canara. The dialects spoken by the *Bhils*, *Budagas Ghonds*, *Konds*, *Santals* and *Todas* are examples of other Dravidian dialects.

Though the Aryas were politically divided into several tribes, they were united in race, language and religion. The tribe (*Jana*), in fact was the political unit and consisted of settlements (*vic*). Each settlement (*vic*) was made up of a number of villages (*grama*). The government of the tribe was patriarchal, that is to say, the tribes were governed by chieftains (*Rajanya*) who either succeeded to their office hereditarily or were elected to it by the vote of the tribal assembly (*samiti*).

Many of the chieftains employed priests to perform the sacrifices and to invoke the help of the Gods in wars. Vasishta and his rival Visvamitra occupied that position under Sudas and Parakuthas respectively, and influenced them to wage wars against each other. Sudas came out victorious and Vasishta composed odes in commemoration of the victory while Visvamitra composed hymns of curses which, though, general in terms, are, according to Sayana, not read by the successors of Vasishta. The priests are considered as terrestrial deities. For sacrificial purposes fire is still produced by friction of two sticks (*Arani*), as it was in the Vedic age.

The head of each family or household was the father or elder man (*grahapati*). Permission to

marry a daughter was asked of him. It was customary for sons and daughters to marry in the order of their age, daughters taking the priority. Marriage was held to be sacred. The wedding ceremony was celebrated in the house of the bride's parents. Thence she was conveyed to her new home. The wedding ceremony of the modern Hindu is essentially the same as it was in the Vedic age.

The bride and the bridegroom were known, as *Dampati* (rulers of the house). Child-marriage was not compulsory in the Vedic age. The Rig Veda speaks of unmarried girls growing old in the house of their parents.

As the family might be continued only in the male line, the newly wedded husband hoped that his bride might become a mother of heroes. No desire for the birth of daughters is ever expressed in the Rig Veda. The prejudice against having daughters survives even to-day.

The wife enjoyed a high position in the Rig Veda, though she was, like the children, subject to her husband's authority. She was the mistress of the house (*grihapatni*) and shared in the control of the unmarried brothers and sisters of her husband. She participated with her husband in the offering of sacrifices to the Gods. Some of the hymns of the Rig Veda were composed by wives and daughters of Rishis.

The Aryas burnt their dead and buried the ashes with recitation of hymns. The custom of Suttee and remarriage of widows is referred to in the funeral obsequies of the Rig Veda according to which the widow lying down beside the corpse of her deceased husband is called upon to rise up and marry another suitor.

The son performs the obsequies of the parents and inherits the ancestral estate. Unmarried daughters should be maintained by him till their marriage, the cost of which should be borne by him. In the absence of the son, the daughter's son has preference. The Hindu law of inheritance as

administered at present has its origin from the Vedic age.

The worship of the Gods in the Rig Veda partook of the nature of a grateful offering, the keynote of many a hymn being "I give to Thee that Thou mayest give to me." Offerings were made to the Gods to win their favour or forgiveness. This is the popular Hindu worship of the present day.

Cattle breeding formed one of the chief occupations of the Aryas. Cows were the chief form of their wealth. The cow is addressed as Aditi and a goddess. One of the Vedic words for war literally means a desire for cows (*gavishti*) and Indra is spoken of as the deliverer of the cows confined in mountains. *Aghnya* (not to be slain) is a frequent designation of the cow in the Rig Veda. According to the white Yajur Veda the cow-killer is punishable with death. In *Gomedha* or *Pasumodha* sacrifice, the animal sacrificed was not the cow but the goat. The sacred remains (ashes) of the animals so sacrificed was partaken by the priests. Every part of the cow was considered sacred. Panchagavya—the purifying liquid worshipped and partaken at every birth and death ceremony of the Hindu—includes even the urine and dung of the cow. The sanctity of the cow and the bull has survived in India down to the present day. The cow is regarded as an emblem of the ritual Goddess Gayatri. Unlike the depressed classes who are locked down upon as beef-eaters, the Aryas never ate beef.

Horses were employed to draw the shining cars used in war or in intertribal friendly rivalry. Felicity in the composition of hymns is often compared to a car wrought and fitted by a deft craftsman. The use of the chariot both for war and in racing, however, slowly died out. Air-ships were not unknown to the Aryans. Sri Ramachandra travelled with his retinue in an air-ship (*Vimana*) from Ceylon to Ayodhya. The art of weaving is referred to in metaphors and similes in the Rig Veda. One Rishi likens his odes to fair

and well woven garments. References are made to the smith and to instruments used in wars and games. In connection with amusements are mentioned music, vocal and instrumental, and dance. Dogs were used for hunting, tracking cattle, and keeping watch at night. The *Gambler's Lament* describes the attendant evils of gambling with dice. In fine, the Aryas had worked out elaborate systems of philosophy, law, medicine, music and astronomy and of the science of language.

THE ANTIQUITY OF THE HINDUS

The ten great Avatars of Mahavishnu help us in this direction. "Just as the Fish had typified the Silurian epoch, just as the Tortoise has started on its way the great amphibian evolution, so did the Boar, that typical mammal, start the mammalian evolution, and we come to the Lemurian continent with its wonderful variety of forms of mammalian life. Then we come to a strange incarnation on this Lemurian continent, half human, half animal, wholly monstrous, that of Narasimha—the man lion, denoting the transition from the brute to the human creation."

We pass to the fifth avatar by which man as man begins to evolve—the Vamana Avatar—that of the dwarf. He was a type of the Brahmin that should be, to whom the earth's wealth should be as nothing, who should have no store of wealth to hold, to whom gold and mud should be as one, each serving as an obstacle to his intended goal. "Everyone of these Avatars belong to periods of time of immense length, when progress was marvellously slow."

Next we come to Mahavishnu's sixth Avatar, that of Parasurama—a strange phenomenon of the Brahmin coming with an axe to slay the Kshatriyas who were tyrannising the Brahmins. This Avatar took place at the end of the last preceeding *Satya Yuga* or *Krita Yuga*, in which occurred the incidents mentioned in Harischandrapakhyaṇa. In order to refute Vasishta's assertion that

king Harischandra never swerved from truth, Visvamitra forced the king to become the slave of a Panchama Visvamitra who was a Kshatriya by birth rose to a Brahmarshi by dint of his tapas, which enabled him even to create many things as substitutes for those in Brahma's creation, e.g., wheat for Yava, chilly for pepper, tamarind for lemon, buffalo for cow, and so on, inclusive of a Svargam for his disciple Thrisanku who was refused admission into Indra's Svargam. The battle between King Sudas and King Katsa referred to in the Rig Veda is said to have been the result of the long existing animosity between Vasishta and Visvamitra who were the Purohitas of those kings respectively. Certain hymns in the Rig Veda ascribed to Visvamitra contain curses not ret'd by Vasishta Gritajās.

The destruction of the Kshatriyas by Parasurama directly or indirectly continued till the end of the Great War described in the Epic *Mahabharata*. He taught archery to Bhishma and Karna who figured in that war. The formation of the Malabar Coast is ascribed to him.

At the end of the next *Tretayuga*, while Parasurama was still in *Aryavartta*, Maha Vishnu incarnated, as the son of Dasaratha of *Ayodhya*, as the seventh Avatar, in the person of Sri Ramachandra whose exploits form the subject of the epic *Ramayana*. Sri Ramachandra received his training from Vasishta and Visvamitra already mentioned. His life is an example to guide humanity in worldly duties, and so the epic is mainly a *Dharma Sastra* and has become a *Parajatanagrantha* with the Hindus. Valmiki, the author of the epic, was Sri Ramachandra's contemporary. It is in Sri Valmiki's asrama that Lava and Kusa the twin sons of Sita—wife of Sri Ramachandra—were taught to sing the exploits of their unknown father. Before the birth of Sri Ramachandra, Dasaratha is said to have reigned 60,000 years. We find the great reign of Sri Ramachandra lasting 10,000 years in the subsequent *Drupada*

yuga, at the close of which Sri Krishna incarnated as the eighth Avatar of Mahavishnu, as also Maharishi Vyasa (Krishna Dvaipayana), the compiler of the Vedas and the author of the Brahma Sutras, the Epic Mahabharata and the eighteen Puranas. The epic Mahabharata is designated the fifth Veda and is mainly a *Jnana Sastra* designed for Sudras, women and outcaste Dvijas. It gives a description of a dramatic performance, by the Pandavas and their party and the Kauravas and their party *per contra*, of a great battle in respect of the *Svarajyam* lost by the former owing to the intrigues of the latter, at the end of the *Dvaparayuga* i. e., not less than 5,000 years ago. Vyasa as the avatar of *Mulaprakriti* produces Pandu and Dhritrashtra representing *Vidya* and *Avidya* or *Jnana* and *Ajnana*, respectively. The Pandavas represent *Viveka* and other virtues as the off spring of *Vidya*, the Kauravas representing *Ahamkara* and other vices as the off spring of *Avidya*. Arjuna is the pure *Atmakhilarana* and Sri Krishna, — the Great Teacher — Teacher not of Arjuna alone, but of every human heart which can listen to spiritual instruction. Sri Krishna says: — "I, O Arjuna! am the Teacher, and the mind is my pupil" — the mind of every man who is willing to be taught. *Avidya* desires *Budhi* represented by *Sanjaya* to keep him informed of the progress of the impending war between his offspring and those of *Vidya*; and the *Bhagavadgita* embodied in the epic in the form of discourses between Arjuna and Sri Krishna partakes of the nature of *Brahma Vidya* or *Upanishad* or *Yoga Sastra*. *Bhagavadgita* is so called because it contains the *sayings* (not *Songs*) of Lord Sri Krishna and deserves high praise for the skill with which it is adapted to the general epic. The *Gita* has become a *Parayanagrandha* with the Hindus. The first six chapters of it treat mainly of *Karma*, the next six dwell chiefly on *Bhakti* and the last six deal specially with the exposition of the *Mahavalya* — "That thou art."

Historians of India cannot now fail to see that the events of the Mahabharata occurred long after those of the Ramayana in point of time.

The next Yuga which has been in course for the past 5,012 years and which has presented the ninth Avatar, that of Buddha, in the person of Siddhartha, better known by his family name Gauthama, is the current Kali Yuga. It has to cover 4,32,000 years. This figure multiplied by 2, 3 and 4 gives the periods covered by the preceding yugas respectively. The total of the four yugas or the Chaturyugi, as they are conveniently called, is 4,320,000 years. 71 Chaturyugas make a Manvantara. In the Sankalpa which is recited at every Hindu ceremony reference is made to the seventh Manvantara now in course as the Varasvatha Manvantara and to the current Kaliyuga as the 28th Kaliyuga of that Manvantara.

While man's age in the current Yuga is limited but to 100 years, it extended to 1000 years in the third Yuga, to 10,000 years in the second Yuga and to 100,000 years in the first Yuga.

To such antiquity the Mosiac creation is but as yesterday, and to such ages the life of Methuselah is no more than a span

My Indian Reminiscences

By Dr. Paul Deussen

EXTRACT FROM THE INTRODUCTION

In recording my impressions of my trip to India in the winter of 1892-93, and thus presenting them to the public I have yielded to the wishes of my friends, partly because, notwithstanding the shortness of my stay in India, I was enabled, being favoured by circumstances, to get a deeper insight into the life of the natives than a European usually gets.

My knowledge of Sanskrit, the study of it had been to speak, my daily bread for the twenty years previous to my trip, was of immense service.

What was to be of still greater use to me in India than the knowledge of the ancient and sacred language of the land, was the fact that I had happened to have spent the best energies of a number of years in entering into the spirit of the Upanishads and the Vedanta based upon them.

PIONEERS OF THE NEW INDIA

BY

MR. VASANT, N. NAIK, M. A.

In the long and chequered history of this ancient land, no influence perhaps has touched the life of the people to such huge issues as the political domination of England with all the accompanying elements of its civilization—its literature, its philosophy, its administrative methods, and its practical bias.

Henceforth a position of splendid isolation became for India a thing of the past. It was pushed in the midst of the world-struggle for weal or woe. The contemplative East could no longer continue to live in detachment, absorbed in the ecstasies of the inner world; active *enthusiasm of humanity* joined to well-disciplined liberty, the dominating characteristic of the West, must needs awaken a permanent and active response in the heart of the East. It was a time of a great life of thought and activity.

Its most intense longing as Sir Raymond West has pointed out was "for the progress of the Hindus towards perfection in knowledge, wisdom and purpose." The prominent members of the school that cherished this noble hope and worked nobly for its realization, in the last generation, are Dadabhoi Naoroji, Pherozshah Mehta, Ranade and Telang. To the lovers of steady reform in all the spheres of national life, no names are dearer than these on this side of India. The last of the noble band though the youngest, was the first to depart from this world. Eight years later died Ranade. The first two, *Providence has yet kindly spared to us*. Dadabhoi bowed down by the weight of years, is resting from his plough, enjoying his well-earned repose after a career of strenuous toil, single-hearted devotion and unparalleled self-sacrifice in the service of his country. Mehta, the robust

optimist, the bold, sagacious and keen-sighted statesman, his faith in liberalism undimmed by the wear and tear of time, is yet the fearless but wise champion of the people's rights. All of them harken us back to the earlier decades of the latter half of the nineteenth century. The statesmen that were then sent to preside over the destiny of this country looked upon it as a solemn charge committed to their care, to be raised slowly but surely to a position of dignity and honour among the free nations of the world. Men like Canning and Lawrence, Meade, Munro and Elphinstone kept this aim steadily in view. The Proclamation of 1858 further sealed the noble tradition introduced by these wise administrators. In the field of political reform that document became henceforth the charter of the people's rights and liberties. It placed before the educated men of those times a goal to strive for. Certainly the times in which Telang and Ranade worked were not the times for defining ultimate political ideals. Indian political life was yet in its crude and incipient stage. The politics that men of the last generation discussed was parochial politics. Only on two occasions between the years 1850-1885, did it assume a national aspect. The Vernacular Press Act in the reign of Lord Lytton and the Ilbert Bill in the reign of his successor, shook the country to its very depths and roused the educated Indians to act like one man. These questions added a momentum to our activities undreamt of before. From that time politics burst forth from its narrow bands and developed a unity of aim. Soon after, the Indian National Congress was formed. Men from different parts of the country could meet henceforward on a common platform. Ideals were defined and aspirations found a channel for expression and fulfilment. Newspapers began to discuss public questions in the light of a common policy. Methods of work underwent an organizing process. An Indian Nationality based on common ideals, common interests, and common sympathies

was conceived of as a possibility however remote. In the wake of the Congress came the Social Conference, an institution that was ridiculed, fought shy of and its purpose travestied in its early days, but which is dominating the minds of the people even as the political problem is getting to be more acute, more fraught with serious issues, and more hard to grapple with, because more complex. The need for greater cohesion, greater unity, greater enlightenment, a stronger moral fibre, thrusts forward questions like mass education, social purity, social justice, a free scope for the development of personality which means freedom from the bondage of hide bound traditions. The elevation of the Depressed Classes, the education and emancipation of women, the protection of the rights of the minors, the freedom of conscience—all these are becoming accepted lines of reform. The fight is now over the methods. Such questions have become firm rooted in the conscience of the various communities constituting the people of India. The bonds of caste and creed are becoming more elastic and loosened under the pressure of the need for greater harmony and co-operation between the different social units that go to form the Indian nationality.

The new environment that has been thus created is as much the product of the silent but energetic efforts of the educated men of the last generation, as that of the pressure of outward circumstance. It is the harvest of the patient toil of these pioneers of Indian progress. We are now in the full glare of the noon. The vision that seemed enchanting to them in the mist of the grey dawn has faded into the light of common day. They worked in the face of that vision. We, their successors, have to press forward without it. But the lines of work are well chalked out, the path is clearer, because of the laborious thought bestowed by them. The work of the genius is accomplished. It is the man of action that is now required. Character is

the sore need of the times joined of course to wisdom, sobriety and right direction.

The four men named above had much uphill-work to do in their own times. They had to work in the midst of the darkness, apathy and ignorance of their own countrymen. In the field of politics they had to do their best not to thwart progress by raising unwarranted suspicion. In the work of regeneration to which they set themselves, active sympathy and co-operation was, to start with, slow in coming. When they urged their views upon the officials, they were asked to set their own house in order before advising Englishmen on their duties. They were told that being a microscopic minority their representations could not be considered as those of the general mass of people composing the country.

If they turned to their countrymen, appealing to modify their own ways of life to suit modern conditions, they were reproached as "bastard bantlings of Western civilization", desecrating old and venerable institutions by their unwise criticism. Both the officials and the reactionists joined hands in regarding their respective institutions as sacrosanct. Thus these men were between two fires.

Some of the schools devoted themselves to politics. Others would, first turn the search-light inwards to free reason from the bondage of superstition and social usage. Midway between these stood Telang and Ranade as apostles of reform all along the line. We are not here concerned with demagogues who made this or that reform a party-cry, ranging themselves into opposite camps with a wide gulf of prejudice yawning between them. With the school typified in the person of Dadabhoi, Mehta, Telang and Ranade there was no spirit of exclusiveness. They had "preferences but no exclusion." They were not politicians to the exclusion of social reform, nor again, were they social reformers who leave politics severely alone. Such one-sided personalities cannot be ranged under their banner.

The greatness of these men lay in the zeal with which they worked to educate other men into the faith which had first dawned upon their minds as the result of Western education. They had studied the history, philosophy and literature of the West under noble masters who gave them a true and sympathetic insight into the working of Western institutions. The study of Aristotle, Plato, Mill, Spenser, Macaulay and Burke had given them a firm grasp of political principles. The study of these authors had also saved them from the danger of making rash experiments where the question was of rebuilding a decaying or decadent social fabric. The history of nations like Germany and Italy, England and America, afforded them a true light in which to view their own prevailing conditions. By the light thus vouchsafed, they penetrated into the causes of their own degeneration and fall. It also suggested to them certain remedies for shaking off the wasting mists, preying upon the vitals of their country. They strove hard to bring together the scattered elements of national life. They dug the furrows into which the seed of new ideas could be fruitfully sown. They had to work in the subsoil of national life. They began from the beginning. They planted the seed of corporate activity. They laboured hard to show what was really praiseworthy in the old. They worked not for reform but for progressive adaptation. The work of the pioneers is often thankless and wearisome. The masses cannot appreciate it. The fruit could not be immediately gathered. Disappointments, misunderstanding, impatience on the part of the followers, blame from the multitude, hostility of the men in power, indifference, heedlessness, a surly attitude if not actual persecution—all these have to be borne, with the gaze firm fixed on the future. This is the price the leaders have to pay for seeing ahead of their times. They have to draw inspiration "by painting the golden morrow on the midnight sky of sorrow." To enter the

promised land is a happier destiny. But to toil on from day to day at the process of renovation is sublime. The task of listening slowly is more arduous. It demands a balanced mind and a steady hand. It requires circumspection, a historic sense, a due measure of the needs of the times, and of the limitations of the environment. It implies tact, sobriety, wisdom and far-sightedness. It is the possession of qualities such as these that entitles man to true leadership. Such leaders alone are capable of laying the solid foundation of true nationality. Leaders like Dadabhai, Mehta, Telang and Kanade in the earlier generation may not make noise or win popularity but theirs is the glory of the silent oak.

Whatever of stir and activity we find in our midst *to-day* is the direct product of their pervasive influence. If they had been born in a country where the preliminaries of national life were all made up, they would have reaped a richer harvest. They would have shaped august decrees or written monumental works. Their names would have shone resplendent in the annals of the civilized world. But finding themselves in the midst of a fallen nation, all their energies had to be concentrated on the work of setting up the back of that nation. Their fame is less, their names may pass into oblivion, but their souls have passed into that of their nation, which, if it ever becomes conscious of its high destiny and attains it, will do so because of them. The flame may be extinguished but its radiance has contributed in no small degree to the illumination that is to come. There was a glorious mission—a mission of revivification. These pioneers of new India, with all their shortcomings, worked in all sincerity, love and enthusiasm for the realization of their own dream. If we can work better to-day, if the future reveals itself clearer to us, let us not forget that we are rising on their shoulders. They cleared up the mist and ushered in the dawn.

Current Events.

BY RAJDURAL.

POLITICAL QUIESCENCE.

POLITICAL quiescence may be fairly taken as the general feature of politics in England and on the Continent. There have been no eruptions and explosions, no international bow-wow or bullying, no bloodstirring tragedies or appalling atrocities. A calm pervaded the political sky and the political horizon was free from clouds, leaden or brizen dark or fleecy. If there have been what may be called "minor events," they were to be discerned in the 'Near East.' But that East and the further one of Persia are more or less always in a condition of chronic "disturbance." It is only when the political dynamitards are abroad and forming at the mouth or battling with the butts of weapons that the rest of Europe is all eyes and ears. But there was nothing of that perturbation in the habitually disturbed area in Eastern Europe to make the continentals rub their eyes, remain without sleep, with their ears constantly at the telephones. So that it may be reasonably asserted that on the whole there was comparative quietude in Europe during the last four weeks.

THE BLOATED ARMAMENTS.

We have heard next to nothing of the "bloated armaments" and their "intolerable burdens." There has been less talk of dreadnoughts and super-dreadnoughts both in England and Germany. Neither much was made of Toutonophobia or Anglo phobia, though a motley crew of pamphleteers, mostly retired admirals and generals, of the squeaking sort and the gentlemen of the pavement, were no doubt busy, as they have been for months past, in the capital of the Mailed Fist, fiercely baiting John Bull and even casting slurs on his political ethics. "Perfidious Albion" is

still on the brain of these ephemeral patriots—idlers who for want of any good work on their hands are upto any mischief. There is no doubt that the rabid section of the German press has been continuously fomenting all sorts of gibes by which to boil the blood of John Bull. The installation of the new German Ambassador at the Court of St. James' in the person of Baron Marshall Bibberstein has given these inconsequential mosquitoes of scribblers a fresh occasion to beat with their stick the perfidious dog of Great Britain. It has been given out that the Ambassador's mission is to bring about a feeling of complete amity between his Government and that of England. *This, however, is denied by the Anglo-phobes at Berlin.* They give the mission only a qualified blessing. At the same time they do not disguise their own inner sentiments and feelings which, it is superfluous to say, are of a most hostile character calculated to rouse passions leading to war. Indeed there is a regular organised party in the Press controlled by some of the highest in the land whose sole object is to entangle Great Britain in a war, sooner or later, with Germany. "Politicians" in the July number of the *Fortnightly Review* describes in unimpassioned language the feelings of the bellicose party and copiously quotes extracts from one of the most militant of Berlin pamphleteers to inform the British public of the rocks and dangers ahead. No doubt that at present there is an outright war of words which is certain to burst out in a real war later on, the awful consequences of which it is impossible to contemplate with equanimity. England is passing through a critical stage. The greatest circumspection, statesmanship, and patience will be necessary to weather the crisis and emerge from it unharmed. The unhealthy naval rivalry is, of course, the root cause. Germans seem to be keen on destroying the naval supremacy of Great Britain. Englishmen resent this determined policy. They do not grudge any other

Power building up its navy for purposes of offence and defence. Not the mightiest Power on earth can prevent the construction. But what the British people resent is the venomous spirit in which the Teutonic race openly declares how it is going to reduce Great Britain to a third-rate power.

ISOLATION OR ENTENTE.

Meanwhile it would seem that there is an inter-neous war in England herself. There is the one section of the public which absolutely condemns the policy of *entente* which has been in vogue these few years, say, since the accession of the late King Edward VII, and specially the Anglo-Russian *entente*; on the other hand is the section which fully believes in these friendly alliances. They perceive every virtue in such ententes. Thus while the one prefers the previous "isolation" policy, the other prefers the recent policy of *entente cordiale*. Each cannot see eye to eye with the other. There is a neutral party which sees some good as well as some evil in both the policies and strives to hold the scales even. But as a matter of fact it is not yet strongly in evidence. The great danger to England, however, lies not so much in her own domestic quarrels, political and economic, but in this new terrible hobgoblin of German naval rivalry. It is doubtful whether the most astute diplomacy can resist the advancing tide of a national sentiment, however mischievous and however fateful. Nations at times have been greatly awayed by their own feelings which eventually overwhelm them with disaster. So that it is more than doubtful whether the pacific mission contemplated by the distinguished Ambassador from Berlin will be accomplished to the mutual satisfaction of both the peoples.

MINOR TORMENTS

Meanwhile there are minor torments for the British Ministry. The Coalminers have had their saturnalia of strike. So the London dockers feel

that they should not lag behind without leaving their mark on the economics of England for the memorable year of Grace, 1912. The other tormentor is the militant Suffragist who the more she is shewn the forbearance and indulgence which is due to her sex, the greater is her power to devise deeds of mischief in a most unwomanly manner. There may be honest differences of opinion among Ministers and Ministers. But that is no reason for the suffragist to annoy and even cause bodily injury to those who cannot agree with her. We may admire her resourceful energy but we cannot approve of her method of putting it into use. Moreover there is a limit to even political "agitation." Agitation by means of *hatchet* to day, as the Irish suffragist is reported to have done when Mr. Asquith was at Dublin the other day, signifies "agitation" to-morrow by measures of bombs and infernal machines. Is old England to bear patiently the new tyranny of the modern militant English woman in pursuit of her rights?

FUZZLING PROBLEMS FOR THE FUTURE.

In France the brigand motorists seem to have terrified people awhile. Brigandage by motors has superseded privateering or buccaneering of old by fast sailing vessels. Modern inventions are not all an unmixed "blessing." There are inventions which render good but are also a source of trouble and mischief. It remains to be seen what may be the ultimate outcome of the most successful aeroplanes of the near future. Will there be frontiers in space, and how may those frontiers be defended or crossed? And when the belligerents all have the use of the swiftest and most destructive airships, where may be the safety of those on land and where may be international peace? All these are world-wide problems of the future which advancing Science is presenting to us at present.

PORTUGAL

The Portuguese Royalist was abroad awhile in the north of Portugal with his rump of a royal-

list band of cavaliers and his carbines in order to overthrow the Republic. What miscalculated energy in pursuit of the restoration of deposed monarchy! The very ineptitude of the republican form of Government is more likely to bring back monarchy than such pitiful exhibitions as those of the solitary royalist who played his role in imitation of Don Carlo in Spain in the latter sixties of the nineteenth Century.

ITALY.

And what about Italy? They engage in some skirmishes, kill a few hundred Arabs of the desert, implacably hostile and fanatic as the followers of the Faithful are, and flash telegrams of their glorious victories as the great Generals of old sent their swiftest messengers to announce theirs in Imperial Rome. But what mockery to compare the "triumphs" of a Scipio or Pompey or Caesar or Trajan with these miserable skirmishes in African deserts with half savage tribes! And yet they are pressing the Italian Parliament to vote them millions of lire to continue this inglorious war which brings neither profit nor glory to the nation. The burden of taxation is increasing but they are just now in no mood to decry it. A single crushing defeat may probably teach a lesson which at present is neither here nor there. The Chauvinistic press, supported from behind by the War Office, is really misleading the unthinking mass. Neither is there any naval "triumph" to speak of. They may dispossess the Ottoman of all the islands in the Northern Archipelago. What then? The Behemoth on the banks of the Rhosphorus is as cool and indifferent as could be imagined. When his own domestic brawls, which send up and send down ministers after the fashion of the earlier years of the Third French Republic, hardly move him, what reck he for the boastful Italian. He allows him enough rope to hang himself with. Resignation of one Chief after the other is the order of the day in the Turkey of "Union and Progress". The Committee is losing

ground and unless there is a fair rapprochement between the Moderates and the Intransigents, it is doubtful whether we shall see a united and progressive Turkey. The Committee has belied the energy, activity and sobriety of its early regime.

The gaunt spectre of famine is stalking his stage in Russia claiming thousands of victims. Starvation among the monks is exceedingly distressful. Sixteen millions sterling are to be spent but even then the relief may not be adequate. All the same the naval and military programme is going forward with a vengeance. Holy Russia at this juncture affords ample pabulum for the contemporary historian to moralise and give the verdict.

PERSIA.

Ill-fated Persia is still in the throes of its own political dilemmas. For the nonce the royal Pretender is beyond the border, though it is impossible to say when next he may be on the warpath. It is the lull before another storm which perhaps is brewed from behind by the subterranean Muscovite. He has been reported to have evacuated Tabriz which is being occupied by 700 of the Persian stalwarts. But money is not forthcoming and the self-opinionated Sir Edward Grey is irritating the nerves of the pro-Persians in and out of Parliament by his far from convincing excuses for his mischievous policy in the matter of the Trans Persian Railway. Why will not Sir Edward let alone this railway? Why will not sit astride on the fence and view the drama going on? It may, however, be taken for granted that as soon as Parliament is adjourned, there will be the customary pranks of the Russian, some surprises, a fresh screaming by the Mejliss and new developments of the precious railway. Wait and see.

THIBET.

Lastly, there is Thibet which seems to be for the present a kind of Macedonian cockpit. There are Lamas and Lamas, the pro-Chinese and the anti-Chinese, between whom a war to the knife has been

going on, and Lhasa is literally "torn up" with their bloody and obstinate feuds. China, however, is determined to re-construct its province and put it on a sounder basis of military administration. Already some 3000 troops are marching from Yunan who will reach Lhasa in four weeks' time. That will be the beginning of the end of the Lama feuds. Meanwhile they say Dorjeff of old notoriety, the *betenou'r* of Lord Curzon, is again in Tibet. That very veracious British correspondent, who is now and again flashing his own prejudiced telegrams to Calcutta declared that the *Buddhist* Russian is with the Dalai Lama who seems not to know his own mind and is now wavering between going to Lhasa or Urga, the home of Dorjeff. Here, too, a new political drama is unfolding itself. But it is impossible to forecast the *finale*. There can however be no doubt that in the long run the Chinese tortoise will establish itself firmly at Lhasa. The Imperial Government at Simla is watching the game from afar and doing good service to the public by "contradicting, when necessary, the sensational and fallacious telegrams of interested English newspaper correspondents from the Chumbi valley.

"A Dying Race"—How Dying. *By Kishor Lal Sarkar, M. A., B. L., Vakil, High Court, Calcutta.*

This has been written in reply to the views of Lt.-Col. U. N. Mukerjee in a pamphlet published by him called the Dying Race and emphasising the physical deterioration of the Hindu population in Bengal. The author maintains that the deterioration is common to both the Hindu and Mahomedan Communities and examines in detail the various causes of such deterioration. There is a chapter on 'The Villified Brahmins,' whose position is defended. The book is worth reading as drawing attention to the good features of Ancient Hindu Civilization.

THE WORLD OF BOOKS.

[Short Notices only appear in this section.]

Tennyson's *Enoch Arden* Edited by *Fredrick Allen, B. A. (University Tutorial Press 1s)*

The edition of literary classics issued by the University Tutorial Press has always enjoyed a reputation for thoroughness and sobriety, and the book under review maintains the usual level of excellence. The pathetic story of Enoch Arden's love and sad end is not probably among the most popular of Tennyson's episodes, though it deserves very wide recognition. The publication of the poem as a separate booklet will certainly serve to enhance its popularity. Mr. Allen has a particularly valuable introductory study of several aspects of the poem.

Sportsmen and Others. By R. C. Lehmann (Bell's Colonial Library)

Mr Lehmann's volume consists of a series of delightful sketches full of the comic spirit. There are illustrations by Mr J. C. Booth, and the author and the artist have combined to produce an exquisite effect of mirth and merriment. The sketches deal with *sportsmen* it is true, but the humour is so broad that it is capable of very general appreciation. There is no indulgence in the technical vocabulary of the world of sports and we expect it is a distinct qualification for increasing the scope of its appeal to readers. We would recommend the book heartily to all who want some recreation for the holidays. As it is in the form of separate sketches it can be appreciated by parts—it does not demand the strenuous application necessary for getting through a whole volume with all the contents continually existing in the mind.

The Door Ajar, and Other Stories. By Virginia Milward, William Rider & Son, Ltd., London.

This is a series of seven powerfully written short stories, the first giving the title to the book. Some of the tales have a weird occult interest.

The Philosophy of Life. By Charles Gilbert Davis, M. D. published by L. N. Fowler and Co., London.

This is a very thoughtful and interesting little work, pointing out the ways that lead to happiness, health, and immortality, and intended to appeal to the commonsense of a reasonable man. 'Man' it says 'is dual in his nature.' There is a mortal mind, and an immortal mind. The normal balance between the two secures health; a preponderance in either direction will lead to anguish, ill-health, and perhaps early death. The central theme of the work is *auto suggestion*, which is described as the most wonderful power known in the world to-day for the development of the Individual. Suggestion breeds disease. Fear, anger, jealousy, envy, hatred, are all the fore runners of disease; and suggestion can largely relieve disease. The book ends with rules of action which, if practised, will lead to peace, content, happiness, and health.

Persian Gems. Part I. Rubaiyyat, by Mirza Kalichbeg Firdunbeg; Premier Steam Press Hyderabad, Sind. (Price Annas 8).

The *Rubaiyyat* of Omar Khayyam as translated by Edward Fitzgerald has won deserved popularity in the English knowing world. The 'Epicurean audacity of thought and speech' as displayed in the quatrains of Omar has a peculiar fascination for the modern mind. But there are also other and later Persian poets who compare favourably with Omar himself in their happy turn for delightful mysticism. Rumi, the grand master of the Sufis, Saadi Hafiz, Rudki, Attar are well known as classical poets in Persian literature. They have not been as yet known and appreciated in Europe for want of a Fitzgerald to introduce them to Western readers. Mr. Mirza has done a great service by rendering some of their songs into metrical English. It is a free translation of the Original in the model of the *Rubaiyyat* of Omar Khayyam.

A Botany for India. By P. F. Fyson, B. A., F. L. S. Christian Literature Society for India. Price Rs. 3.

As the author who is the Professor of Botany in the Presidency College, Madras, says in his preface to the Book, it has been written for those beginning to study Botany in India. Part I of the book deals with the general external features of flowering plants and their growth, while the study of the internal structure which would necessitate the use of a microscope is not considered at all in the book. Part II deals with what is called "systematic Botany" and will be of interest to those who want to acquire a scientific and systematic knowledge of the subject. Although the book is evidently and mainly intended for the use of students of the Intermediate and B. A. classes the study of plants is so generally treated in Part I that even those who are not preparing for any University Examination will find it quite easy reading; and there are specially certain chapters in the book such as those on "climbing plants" and "Distribution of Fruits and Seeds" which will be found particularly interesting to the general reader. The style adopted is throughout easy, simple and non-technical except where absolutely necessary. We can safely commend the book not only to students but to every one who wants to acquire an elementary knowledge of a Science the study of which will be found to be highly attractive and fascinating. A study of the book will also stimulate in the reader a desire and a curiosity to know more of the hosts of plant-life with which he is surrounded. The book contains a large number of illustrations and these have been specially prepared for this work. Both teachers and students of Botany in this part of India have always felt the absence of a suitable elementary Text Book on Botany dealing principally with Indian Plants and we are glad that this want has been so successfully supplied by the author.

My System for Ladies *By* **Lieut. J. P. Muller**, (*Everatt, Seymour and Co, Ltd, 12, Burlington St. London Price 2s 6d*)

This little book is a companion volume to the author's earlier work "My System." It is exclusively devoted to the instruction of the fair Sex. The various exercises are described with great care and admirable clearness with the aid of many excellent photographic illustrations. The supplementary chapters relating to the attainment of health and beauty, especially the special Exercises for the Neck, the Foot, Massage of the Face, Shapeliness of the Hips etc., will be found particularly valuable. The whole book is written in a clear and simple language. The original work had a record sale of over half a million copies. We trust that ladies in search of health and beauty will not fail to give a trial to the author's "System without apparatus."

Who's Who in Japan. *By Shunyu Kurita*
The Who's Who in Japan Office, Tokyo, Japan

This is the first book of its kind in English published in Japan by a Japanese Scholar. With the growth and development of Japan as a first rate power, her relations with the world are becoming more and more complicated. Students of affairs all the world over have been struck with the marvellous capacity of the Japanese nation and it is almost the fashion of the day with politicians and social reformers to cite the example of that country to illustrate their point. Thus, an insatiable interest has been awakened for a knowledge of things Japanese. Not the least of them are the lives and doings of the eminent men of Japan who have made her the world power she is to day. Mr. Kurita has really rendered an invaluable service to the world by bringing out a volume of the kind we have before us. Nearly all the great men of Japan in every walk of life find a place in it and with the illustrations and the short account of their lives, the book may be said to contain the cream of Japanese thought and vitality.

Pure Gold. *By H. C. O'Neill* "*The 'Peoples Books Series,' T. C. & E. C. Jack, London and Edinburgh*"

Some of the choicest lyrics and sonnets in English have been brought together in this unpretentious little volume. From the Forsaken "Mermaid" of Matthew Arnold to the great "Ode" of Wordsworth with which it ends, the whole book is a fountain of perpetual delights. Recent attempts in lyrical poetry being so successful and voluminous, great judgment has to be exercised in the preparation of an anthology of this kind. All modern poets only have been represented and here and there a chaplet of verses from Spenser or Shakespeare brings to mind the feeling of a former world. Indeed every age of English song is reproduced; the book is indeed a veritable mine of Pure Gold.

The Sign *By Mrs. Romilly Fadden (Macmillan).*

This is a novel of art life, with the scenes laid in Brittany, and with three English artists as the principal characters. The novelist has successfully brought into conflict various theories of art and life and quite appropriately leaves the reader to judge for himself as to their relative merits. In fact, the charm of the novel consists in its suggestiveness. The human interest of the story lies in the two principal characters—Samuel Sturd and Manik Boeck—who strive for great things in this world. And although the novelist truthfully depicts them as not having succeeded in any conspicuous way in their unselfish endeavours for others there is no doubt that the reader will rise from the reading of this novel with a solemn resolve to do his best for others.

"The Chasm" *By Alice Penn (Menthuem).*

This novel is an attempt to paint something of the life of an Indian Civilian in India and consequently something of the life of Indians here. If the civilians and the lower orders of Indians would like to see themselves as others see them, they may turn to this novel. The lack of sympathetic imagination on the part of the novelist may be said generally to mar the effect of the story.

Poetry and Life Series. Edited by William Henry Hudson. (George Harrap & Co.).

Gray and His Poetry: *W. H. Hudson* 1s.

Coleridge and His Poetry: *K. E. Rogers* 1s

Matthew Arnold & His Poetry: *F. Birkley*. 1s.

Lowell and His Poetry: *W. H. Hudson* 1s.

When Matthew Arnold complained that Wordsworth's poetry was not very popular as the good pieces were mixed up with several bad ones, he was giving expression to a principle affecting the entire range of Poetry. The poets must be able to command wider attention from laymen than they would seem to do at the present day, if only some effective means could be found for this choice and a living interest be created in their pieces by supplying the commentary necessary for linking them together.

The bright little series which is now before us for review is not the least important of the useful work which Mr. William Henry Hudson has done in recent years. A powerful impetus must be given to the popularity of poetry by this means. The remarkable feature about the volumes is the association of the selected pieces with the incidents of the hero's biography. There is a study of the author as revealed in his work and an appreciation of the work as the expression of the peculiar circumstances influencing the author in his life.

The illustrative pieces are selected with an unerring critical taste and the volumes might be made use of as anthologies by themselves.

It is quite possible to express a note of dissatisfaction at the exclusion of deserving pieces but we would not press the criticism so far as to detract anything from the value of the books. We have however no hesitation in commending the volumes to students in our colleges and to readers of English Poetry in general as they are undoubtedly calculated to refine their tastes, extend their knowledge and afford genuine pleasure.

Diary of the Month, June—July 1912.

June 22. At a Meeting of the Calcutta University Senate this afternoon it was announced that Mr. Taraknath Palit had made over to the University property worth over Rs. 7 lakhs for the foundation of two professorships, one of Chemistry and the other of Physics.

June 23. News received in Kurram valley confirms the report from Kabul that the Khost rebellion is at an end.

June 24. The House of Lords this evening passed the third reading of the Government of India Bill.

June 25. In the House of Lords to-day the Royal assent to the Government of India Bill was announced.

June 26. Lieutenant-Colonel A. C. Tate, R. A. M. C., and Lieutenant-Colonel E. G. Browne, R. A. M. C. have been appointed Honorary Surgeons to H. E. the Viceroy.

June 27. Reuter learns that H. H. the Aga Khan has consented to stand as the Bombay Mahomedan representative at the ensuing election to the Viceregal Legislative Council.

June 28. The funeral service of the late Field Marshal Sir George White was held in the Royal Hospital Chapel, Chelsea, to-day in the presence of the representatives of all the cantonment royal-ties.

June 29. Today Mr. Justice Karamat Hussain sat for the last time as Judge of the Allahabad High Court. The Bench and the Bar of that Court presented him an address.

June 30. The frontier correspondent states that the Zekkakhels are much excited and fears further outbreaks of violence from that quarter.

July 1. Lord Crewe to-day received a deputation of the English and Indian members of the

International Cotton Committee, who urged that they should receive the support of the Government of India for the extension of cotton growing in India.

July 2 Sir John Nixon has been appointed to the Army Command in India rendered vacant through the retirement of General Sir Edmund Barrow.

July 3 The statue of Lord Clive has arrived in Calcutta and has been deposited in Government House.

July 4 The residents of the Champaran District met under the presidency of Mr. W. S. Irwin, Messenger, Mothari Indigo concern, and passed Resolutions urging the founding of a High Court and a University for Behar.

July 5. In order to provide more adequately for the interests of Indian students in London, Lord Greve has created a Secretaryship for Indian students. Mr. C. E. Mallet will be the first holder.

July 6. Arrangements are being made to hold a Swadeshi mela this year in Calcutta. The object of the fair is to bring together the products of domestic industry.

July 7 The Conference which sat in Calcutta to discuss matters relating to the Dacca University scheme has broken up. It is understood that the Hardinge College will be established at Dacca.

July 8 A Committee of journalists, headed by Lord Northcliffe and the Hon'ble H. Lawson, M.P., has issued an appeal for a memorial to the late Mr. W. T. Stead.

July 9. Their Highnesses the Maharajahs of Indore and Gwalior have each announced a subscription of five lakhs of rupees to the Hindu University.

July 10 Mr. B. M. Malabari, the well known writer and philanthropist died at Simla to night from failure of the heart's action.

July 11. H. H. the Nizam has been pleased to appoint as his prime minister Nawab Salar Jung, grandson of the great Sir Salar Jung.

July 12. A telegram from Simla intimates that the Executive Council for Berar will be constituted with effect from the 1st of August.

July 13. The remains of Mr. Malabari were interred this evening, honoured by all from H. E. the Viceroy downwards.

July 14 H. H. the Maharajah of Dhurbhanga started on a tour this morning to collect funds for the Hindu University. He has announced that the total collection is about 70 lakhs besides the annual grant of Rs. 24,000.

July 15. Their Excellencies the Viceroy and Lady Hardinge attended this morning the Christening of the child of the Hon. Mr. and Mrs. Clark, H. E. the Viceroy standing sponsor to the infant.

July 16 Mr. Lindsay, I.C.S. has been appointed to succeed Mr. A. H. Ley, Under Secretary to the Government of India in the Commerce and Industry Department.

July 17. After a stormy discussion in the Bombay Senate Sir P. M. Mehta carried the bill to create a commission to frame rules and regulations regarding the conduct of business and debate.

July 18 A strike of some 5000 workmen attached to the Balley Jute Mills, Calcutta is reported and this is said to be a protest against the introduction of the New Factory Act.

July 19 An Indian reception was held to day in London in honour of the Hon. Mr. Gokhale, Sir M. Bhowanagree presiding.

July 21 The death is reported of Mr. Andrew Lang, the writer.

July 22 The Hon'ble Sir Harcourt Butler opened the European Education Conference to day at Simla with a brief address.

TOPICS FROM PERIODICALS.

An Anglo-Indian Poet.

Mr. P. Seshadri, M. A. writes to the *East and West* for June an interesting appreciation of the life and work of John Leyden, an Anglo-Indian poet who flourished in the early days of the Nineteenth century and whose literary achievements were held in high esteem by his contemporaries. Leyden is almost forgotten to-day and it is but right that an estimate of his services to the world of letters should be made known at least in Southern India where the most precious part of his life was spent. He was an intimate friend of Walter Scott and Bishop Heber and some of his verses are quoted with approbation in Chambers' *Cyclopaedia of Literature*. Indeed, as Mr. Seshadri illustrates with several extracts from his poems, his work deserves sympathetic notice even from serious students of literature.

Leyden was born on the banks of the T-riot in 1778 and his career was romantic. In 1803 we find him in Madras as Medical officer in the service of the East India Company. He quitted the General Hospital soon after and was promoted to be a physician to the commissioners of Mysore. After some wanderings in Mysore, Malabar and the Central Districts of the Presidency which gave him exceptional opportunities to study the conditions of the people and the regions of Southern India he embarked for Malay where the Mysteries of the Malay race engaged his attention and opened a "new world of imagination." From there he wrote a treatise on the languages and literatures of the Indo Chinese nations. He then came back to Bengal and held various high offices under the Government. Then followed his ill-fated expedition to Java in company with Lord Minto where his zeal for research led him to examine certain rare Oriental Manuscripts and Dutch records in a low Chamber from which he never emerged alive. He died in his thirty sixth year.

It may be said that Mr. Seshadri is unearthing an insignificant entity from his deserved oblivion. He is not unaware of the limitations of the poet. He does by no means exaggerate the merits of John Leyden. He indicates the peculiar school of poets to which Leyden belongs by his sympathies and by the natural bent of his genius. He says distinctly :—

An attempt to survey Leyden's poetical work must be prefaced by a warning against the common weakness of raising literary mediocrities into masters. It is not maintained for a moment that Leyden's name deserves a high rank on the list of English poets, though it must be granted that he has bequeathed a more valuable heritage than many of the obscure versifiers who, for instance, weigh heavily on Johnson's *Lives of the Poets*. Leyden's work offers an interesting study in the two powerful cross-currents operating on the literature of even the age of Wordsworth, the old order of artificiality, convention and correctness striving vainly against the infusion of Romance. Leyden's sympathies are entirely in favour of the new movement, but he is still in the charms of the heroic couplet and the social verse of the eighteenth century expositors of song. The vein of Satire is strong enough and he is a true disciple of Pope in his attack of the social fashions of the age and in his poetic treatment of the drawing-room.

Mr Seshadri then reviews Leyden's Indian Poems which are about a dozen and observes that they furnish an interesting commentary on varied aspects of Indian life and civilization. He quotes with evident appreciation the commemorative lines on the Battle of Assay in praise of the gallant band.

that broke

Through the bursting clouds of smoke
When the volleyed thunder spoke
From a thousand smouldering mouths of lurid flame.

In reviewing the whole cycle of his Indian poems the writer is struck with the tragic significance and the pathetic expression of anguish and fear contained in the lines

Far from my sacred Natal clime
I haste to an untimely grave!
Fore-doomed to seek an early tomb,
For whom the pallid grave-flowers blow,
I hasten on my destined doom
And sternly mock at joy or woe

But it is happy that the poet knew his own vocation. He knew his capabilities and applied himself strenuously to accomplish what he set his hands upon. His ambition was amply fulfilled.
Enough for me, if fancy wake the shell,
To Eastern Minstrels' strain,

The Russian advance upon India

This is the subject of an article in the *Outlook* of the first week of June by Mr. C. H. Norman. General Sobolev who was the chief of the Russian staff in the Asiatic Department is reported to have said :—

A body of European troops established at Herat, and standing with its front to the south east, would draw upon it the attention of the whole population of India. In that lies the significance of a military occupation of Herat, and it is not without reason that a number of English experts, knowing India well, have expressed their belief that were an enemy to occupy Herat with a powerful force the English Army, without having fired a shot, would consider itself half beaten.

It is to the logic of facts that the Hindu Kush, the natural boundary of India, should shortly form the frontier of Russia, and that the province of Herat should fall in Russia's hands. [His added] The more powerful Russia becomes in Central Asia the weaker does England become in India, and consequently the more amenable in India.

Not content with pressing forward in Central Asia Russia resumed her encroachment upon Persia. This has emboldened Herr Popowski to make the following disquieting judgment in the course of his work on "Rival Powers in Central Asia":—

From the above survey of the Anglo-Russian diplomatic relation in regard to Asia in the nineteenth century, it is evident that Great Britain is unable to arrest Russia's advance in Central Asia, and a careful study of the present situation leads us to the conclusion that in the future she will be equally powerless to check Russia's progress on the northern frontier of Persia and Afghanistan.

Relating to the British policy in Persia, the Government of India sent a despatch to the Secretary of State in Council in 1908. Lord Minto's Government then wrote in concluding the Despatch :—

We desire deliberately to say to your Lordship, with a full consciousness of our responsibility in so saying, that difficult as we find it in existing circumstances to meet the financial and military strain imposed upon us by the ever increasing proximity of Russian power upon the northern and north western frontiers of India from the Pamirs to Herat, we could not contemplate without dismay the prospect of Russian neighbourhood in Eastern or Southern Persia, the inevitable consequence of which must be a great increase of our own burdens, while the maritime defensibility of India would require to be altogether reconsidered were the dangers of a land invasion to be supplemented by the appearance of a possible antagonist as a naval power in waters contiguous to Indian shores. Upon the question of allowing any

European Power, and more especially Russia, to overrun Central and Southern Persia, and so to reach the Gulf, or to acquire naval facilities in the latter even without such territorial connections, we do not conceive that any doubt whatever can be maintained; and we imagine that it will be accepted as a cardinal axiom of British policy that no such development would be acquiesced in by her Majesty's Government.

After saying and that this policy has not been maintained throughout and that it has been consistently neglected the writer concludes with the words of the Marquess of Dufferin and Ava :—

Any further approach of a great foreign military Power towards the confines of India would entail upon the latter country such an intolerable amount of expense in the shape of additional fortification and other measures of defence as would become absolutely intolerable and would be less preferable than any other alternative, however serious.

Ideals in Education.

A writer in the June number of *Prabuddha Bharata* discusses the question "What is Education in the light of the Vedanta Philosophy?" He explains the sixfold ideals of Education. The first ideal is the conception of the true individuality of man. The second is a nobler conception of education itself, resulting, necessarily because of the first ideal. This consists in regarding education not as a scholastic training, but as a life process in which spiritual and true individuality is revealed. Education in this sense is a Process of constant Becoming. It is the development of the whole individuality. The third ideal is a clear conception of what constitutes the main subjects of education, and from the stand point of the Vedanta these are but two—Truth and Reality. The fourth is the realization of the distinction that exists between mind knowledge and the knowledge of consciousness. The fifth consists in the conception of the uses of education. And the sixth ideal in education, says the writer, is :—

A constant holding in mind of the vision of the revelation to which the spiritually-understood education leads, the expression of true spiritual individuality, when all limitations that constitute ignorance have been broken or transcended.

The English in Ceylon

Mr. Jotindra Nath Sen in the *Hindustan Review* for May—June writes on the subject "The English in the Court of the King of Ceylon." The history of the British occupation of this "Pearl Drop of India," this "Emerald Gem" is an interesting study.

Ceylon had once been the arena of successive struggles for the supremacy in the East between the three most rival nations of the West, viz., the Portuguese, the Dutch and the English. The latter became successful in subduing the Dutch who expelled the Portuguese from the field in 1658. The dominion of the Portuguese in Ceylon continued for about 150 years and that of the Dutch for nearly the same period.

Then began a series of overtures between the Dutch and the English. The first two wars did not settle the disputes. The third was in 1795. This time under their able general Stewart the English were successful in reducing Trincomalee after a siege of three weeks. Strengthened by this unexpected success, the General advanced against Jaffna and took it easily. In 1796 Negombo fell. The English then advanced to Colombo which was subdued in a short time. Thus all the exterior possessions of the Dutch fell into the hands of the English.

On obtaining possession of the Dutch settlements the English were trying to remove the injurious impressions which the reigning prince was entertaining against them. Meanwhile in 1802 an unexpected thing happened which turned the policy of the English decidedly.

The plunder of some Mahomedan merchants proceeding from the coast into the interior was made the ground of demanding satisfaction by the authorities at Colombo. This the Kandian court would not give, and accordingly, early in 1803, General Macdowell and Colonel Barbut were ordered to advance on Kandy from Trincomalee and Colombo. They arrived and took possession of the town which was completely deserted and there they proclaimed Mutu Swamy king of Kandy and the interior.

A treaty was then entered which contained numerous stipulations in favour of the English. One article declared that a tract of land stretching directly through the heart of the Kandian territories, from Trincomalee to Colombo, should be ceded in perpetuity to the English for the construction of a road; and another, that "a British force be stationed at Kandy to secure the new sovereign from the violence of his mountaineer subjects."

What is Imperialism?

In the course of an article on the above subject in the April—May number of *the Rajput Herald*, the Editor observes:—

An Empire, in the proper sense, is the collection of different nationalities under one control, for the sake of mutual advantage. In naming the British Empire, we mean the amalgamation of different parts of which the British Empire is constituted, always strictly bearing in mind that such an alliance is intended for mutual advantage, and based, not on absolute equality, but on co-ordinate alliance. Every atom of the Empire is bound to perform its own function in conjunction with the rest for the progress and improvement of the whole. India is a component part of the British Empire, and as such she is expected to perform her duties in harmony with the relative duties of Australia and Canada. South Africa is as much to England as India, and even England is as much to the British Empire as India. A mutual, cohesive co-operation for the ultimate good of the parts, as well as the whole, based on absolute and unconditional equality, seems to me to be the only definition of Empire.

For a practical illustration of true imperialism the Editor bids us study the history of the reign of Akbar. The principles of administration as practised by the great emperor, are in fact, the principles of true imperialism, and can be taken as models in our day by our modern Empires to advantage.

But these principles were disregarded by Aurangzeb, and the Moghul Empire so firmly knit together by the steadfast energy of Akbar, was shattered to pieces. There is therefore a lesson and a warning for those in charge of the British Empire. The Editor concludes:—

Two Western Empires to-day stand prominent in the eyes of the world, both powerful, strong, and united. The English and German Empires are the only examples in the present day of well constituted and admirably regulated Empires. It is not our duty to portray the circumstances under which these two Empires were formed; it is sufficient to take the two as they are. The German Empire does not suggest anything very extraordinary, either in its organization or upkeep, as the whole Empire is more or less united in language and tradition. But the British Empire is constructed on various divergent lines, based on glaring inequalities, and composed of different forces. Hence one looks with deep concern at the progress and continued prosperity of this Empire. The first fly in the ointment was the separation of America, which might very well have been avoided, and this sets one thinking the more. Great issues hang on the British Empire, and what was restricted to the Moghul Empire in a small degree has been expanded in a larger and wider range in the present British Empire.

Severance of Ceylon and India.

The July number of *The Dawn* contains a very valuable contribution on this subject by Babu Sarada Charan Mitra M.A., B.L. He contends that India is an integral part of India both historically and geographically, and that the severance of their connection is a pathetic accident. Accidents severed Ceylon from India, but their political severance is peculiar in the history of politics. India is a Dependency of the English King while Ceylon is a Crown Colony of Britain.

But the fact remains that India and Ceylon are essentially one in culture and civilization. The learned writer illustrates his position with the following observations —

The worst feature of the present administrative separation between India and Ceylon has been the virtual separation of the two peoples. British Indians have forgotten Sinhala as part of Bharatvarsha, as their own Lanka, while the Sinhalese have forgotten that they once represented an integral part of Hindu politics. The sentiment that had once formed a powerful tie of union between them has almost disappeared. Union is strength and no nation could be great, intellectually, morally or spiritually, unless its component parts felt for each other and were united by common ties of love and sympathy. The time has come for the awakening of the East and for the revival of those mutual feelings and sentiments that once animated the ancient Hindu kingdoms (including Sinhala).

It is extremely regrettable that the Sinhalese have been drifting into denationalisation which the philosophy of history tells us is associated with ultimate downfall. We are afraid, says the writer, that the tendencies are not favourable to the spontaneous and natural growth of that spiritual life which is the only true life in Oriental civilization. He concludes

The tendency of a strong alien rule over a barbarous or even a semi-civilized people by a highly civilized race has generally been found to be towards disintegration or abject degeneracy of the conquered people. The tendency, however, is towards fusion, if the conqueror has respect for the civilization of the conquered. But the greatest danger of a conquered race, where fusion is impossible, lies in the desire of servile imitation leading to a putable degeneracy. The plain duty of the rulers and the leaders of society of the conquered race is to guard against this mischief of alien rule, to prevent degeneracy, or assimilation, and to impart a stimulus to the forces making for spontaneous development. The avoidance of imitation of erotic habits, manners and customs assumed to the native instincts and habits of the conquered is essential to their real well being.

Ancient Indian Botany.

A writer signing himself "A Science Student" discusses on "Ancient Indian Botany" in the June number of the *Fergusson College Magazine*. Regarding the knowledge of Botany in ancient India he says —

Many of us do not seem to realise the close connexion that exists between the vegetable world and human life. Our food largely consists of vegetable products, and the Hindu religion has laid under contribution a large part of the vegetable kingdom. Our Indian system of curing diseases has its very soul made up of plant-life. With all this the Botany of Indian plants does not form a part of an Indian student's knowledge. The lack of proper knowledge of the properties of plants made use of is the Indian Pharmacy on the part of doctors has resulted in a depreciation of the Indian system of medical treatment. We have even ceased to believe that the ancients did know something about plant life. It is true that India had no systematic Botany of the nature of the modern one, but it has to be conceded that our ancestors did possess an accurate knowledge of the properties of several plants, the mention of which is made in Sanskrit literature.

The nature of the ancient Botany in India was far different from what it is today. Our ancestors had never written a systematic treatise on the subject. Our knowledge of Indian Botany is largely gathered from the various Sanskrit works. The Botanical observations of the sages are not embodied in a single volume. They are scattered all through the ancient literature. Besides they have never been classified with any scientific skill. Here and there, there are reflections from the field of Botany to which we in our pride trace every modern invention. Besides little care was taken by the sages to describe plants fully. The works of the common tutors have all been lost. Doubts arose as to the identification of the plants. Medical men vied with one another in committing blunders. And in this confusion the European system became familiar. What then are we to do now?

What is wanted is a study from the modern point of view and on modern lines. The importance of Botany is increasing every day and the knowledge of plants when combined with other branches of science like chemistry can achieve great things. This work of investigation lies in the hands of the educated people of India and business capacity and capital will flow in when sound processes of manufacture are planned by the former.

Akbar—A Study.

The *Muslim Review* for May contains a lengthy sketch of Akbar by Mr. Fakhr-ud-din Ahmed B.A. He says that the name of Akbar has a magnetic effect in India. It is fortunate that he lived in an age that was fairly well advanced in culture and civilization, so that there are records of his time extant, which throw a flood of light on the doings and sayings of the great Indian prince. Of the early life of Akbar Mr. Ahmed says:—

Akbar from his very childhood has been inured to a hard and trying life, and consequently, he could meet boldly all the troubles which beset him at the outset when he entered upon the serious part of his career. His early life is chequered and forms a long chapter of hard and exciting adventures. Having been born in a desert when his father was pursuing his course of helpless flight, he had to pass the first years of his life in the charge of an inhumane uncle. While yet a child, Akbar was deprived of the care of his father and placed in an irksome custody. How miserable an existence the child had, how he was cruelly exposed to the fire of cannons and what miraculous escapes he had therefrom are now familiar things. Anyhow, he survived this dastardly inhumanity and subsequent troubles and this was highly significant. He was ordained for something great and to have an undying name. However overwhelming the dangers might be, he was not to die until he had made the great mark for which his memory is enshrined in the minds of myriads of people. It was in a school of adversity that Akbar learnt his first lessons. This school has the distinctive merit of at least saving those who are born in the purple from the overrating influences of a gay and gorgeous court.

It was with valuable training, varied experience and boldness in the face of dangers that Akbar started with his father at the age of thirteen on the expedition for the recovery of their lost patrimony, the Empire of India. And how did he rule the country of which he became king? He ruled with wisdom and sympathy. He solved the Hindu Muslim problem long ago. His reforms in the administration are standing monuments of his "gift for statesmanship." The writer says:—

To further ensure the happiness of his subjects under the new revenue arrangements, Akbar modified, reduced and in some cases completely abolished various dues, tolls and taxes. Impositions like *tamgha*, *Gowahwari*, *Balkati*, *Sardrakhti* and *Baschia* (on joint proprietorship) were immensely modified and some of them even completely abolished. Among these abolished taxes was also the much talked of *Jaza*.

And again:—

By his matrimonial alliances and judicious distribution of commands and offices, Akbar had made friends with the Hindus. Equipping himself with an elastic conscience Akbar had, for the greater part of his life, bidden good bye, in all forms and practices to religion of his ancestors. In Rajput warriors he counted the best supporters of his throne and that was only a just return for merging and forgetting his Moslem identity in a wider Indian nationality. It was fairplay and no favour when the devoted Hindus of his time were absolved from the payment of the *Jazy*.

Then follows an account of Akbar's various religious and philosophical wranglings. The result of such a policy of sympathy and toleration in an age of bigotry is portrayed. The writer concludes:—

In short, Akbar's life presents a variegated sketch. He was a sound politician, a great general and a good king. He is said to have posed as a religious reformer and there he cut a sorry figure. That he could not be, his want of education and illiteracy stood in his way. This reflects little credit on him, but he could not but yield to circumstances. He had to pay the penalty of his own ignorance, of overweening harem influence and perhaps a wrong estimation of what real toleration and conclusion meant. And then he made sufficient amends if he really abjured the new faith. But even if we admit as some historians would make us believe, that he died a non-Moslem, we would think of him in the light of the surroundings in which he was placed. Strictly speaking there is no innocence without guilt and hardly any guilt without some innocence. If he falters here, he more than redeemed it elsewhere. His merits as a ruler far excelled his faults as a religious reformer and it is only natural that he should command a tribute of respect and admiration. With all his faults he has left behind him a monumental name and we hardly exaggerate when in his death, we say, 'we see life in death.'

The Heart of Hinduism.

"The Heart of Hinduism" is the subject of two papers from the pen of Sir Narayan Chandra-varkar to the *Times of India*. He believes that idol-worship is not one of the injunctions of the Vedas. What then is Hinduism? Neither the Vedas nor the custom of idol-worship can give us an insight into the heart of Hinduism. Both the infallibility of the former and the degradation of the latter have been proclaimed and asserted by large bodies of men within the fold of Hinduism itself. To get to a precise definition of Hinduism is difficult. Sir Narayan says:—

You know the health of a man, it is said, from the condition of his extremities. So, in the case of a people, to know the heart of their religion, you must go to the humblest and lowliest of them. Those on whose toil we live, who know no luxury and who live in huts—talk and converse with these, I humbly think, let us into the heart of Hinduism as nothing else can, for, from their lives, thoughts and struggles we come to know in a vivid manner both the dignity and the degradation of Hinduism—the dignity of its essential truth, the degradation it has suffered in consequence of drift from that truth.

No text has more powerfully influenced Hindu Society than that which is embodied in the words, Dharma, Artha, Kama, and Moksha, meaning duty, wealth, desires, and final absolution or salvation. The text means that man lives for the purpose of these four objects in this world. There are two schools of thought one emphasising the need of the ascetic life and the other singing in praise of the Grihastha asrama. Sir Narayan concludes:—

The heart of the Hindu community then is at the core, the heart of the man who tries to win and realise the Kingdom of God within him by means of the life of a householder, keeping his home to serve his society and State, because it is the home out of which come the State and Heaven. But the school of asceticism has not failed to exercise its sinister influence on that heart, and so the Hindu has come to be a mixture of the householder and the ascetic; he struggles blindly between the two, and hence the "mild Hindu," his chaos and confusion, his innumerable castes, and dissensions. And yet there is the heart, would we but see it, and hear it whole and bring it back to its original soundness,

The Rani of India.

In a recent issue of *The Women at Home* Mr. Saint Nihal Singh gives a picture of the Rani of India. It is more or less a personal reminiscence. Of the Rani of Gondol, he says:—

Her Highness, in reply to questions, told the story of her emancipation. The gist of it was that the chief had imbibed advanced notions from his Western tutors at the Rajkumar College and in the course of an extended tour in Europe, and she loved dearly to allow him to slip away from her because she was not advanced enough to be a true comrade to him. So, although, the prejudices in regard to the segregation of the sexes were bred in the bone, she decided to be the first Indian noble woman to cast aside the veil, and also assiduously applied herself to her studies so as to become educated enough to be a pleasant and useful life companion to her liege lord, endeavouring to keep pace with him in his progress. She said it all as unassumingly as if it was nothing more than going to sleep at bed-time.

Then follows a picture of H. H. The Maharani of Baroda. After describing her features and her fondness for jewels, he says that Her Highness did not relish the bold methods of American ladies and resented being persistently and bluntly quizzed about countless personal matters. Though she was not favourably disposed towards the women of America who seem to her eyes to misuse liberty her views on the freedom of women in general and Indian women in particular may be noted.

After dinner we adjourned to the billiard and card-rooms, and the conversation turned on the emancipation of Indian women. Her Highness spoke with a fire that would do credit to a London suffragette. She told me that it was man's selfishness which made him keep her sisters ignorant and superstitious, fearing that the fair ones, if they were to become educated and advanced, might rebel at cooking and dishwashing. She said that men really do not want independent women, no matter how much they may prattle about their desire to have self-respecting, self-appreciative women about them.

He then gives a detailed account of the home life of the Rani of Travancore. They live a purely Indian life and their manners and mode of life are in no way affected by the fashions of the day. They are absolutely orthodox in their movements and they are scrupulously religious.

Mr. Nihal Singh concludes by giving a sketch of the Begum of Janjir, a small native state in the Bombay Presidency a Mahomedan Rani, perhaps the only emancipated Moslim Queen.

What the I.M.S. has done for India.

The question has often been asked, what has the Indian Medical Service done for India? Various complaints have been made from time to time against the members of the Service that they have done little or almost nothing of research work in medicine, especially in tropical disease. In vindication of their achievements the I. M. S. supplement of the *Indian Medical Gazette* says:—

In order to justify the maintenance of a Medical Service, it is not necessary to show that it has gone beyond the sphere of daily duty. If the members of that Service have, with few and rare exceptions, honestly carried out the duties entrusted to their charge, that seems to us sufficient.

Then follows a historic record of the *personnel* of that Service. Among the illustrious band of workers in the service of that profession Boughton and Hamilton stand out prominently in the early story of British India, as recorded by legend, and even by sober writers of history. It is not indeed necessary to enumerate the services of individual members of the line but it may be safely attributed to this service that the whole *personnel* of the English mission was brought into high favour at the Mughal Court. The writer says that both Boughton and Hamilton "helped to lay the foundation of the British Dominion in India and no greater benefit than that has ever been conferred by one country upon another."

To describe the careers and work of these individuals in detail would require a book. The writer therefore recalls the services of the members under various heads which he gives as follows:—

1. Introduction.
2. Medicine and Surgery.
3. Medical Education.
4. Travel and Exploration.
5. Natural Science and Economics.
6. Philology, Ethnology, Literature.
7. War Services, etc.

He then traces the growth and development in each of these lines of work and pays a well merited tribute to the members of the service for their self-sacrificing labours and achievements.

The Railways of India.

Commenting on the instructive and useful contribution to the discussion of the history and progress of the Railways of India by Mr. Neville Priestly, the Managing Director of the South Indian Railway, the *Statist* has some very valuable observations to offer. As Sir Edgar Speyer pointed out at a meeting of the Royal Society of Arts, India only possesses about the same railway mileage as England notwithstanding the fact that its size is nearly fifteen times greater and that it contains seven times as many people. In other words the mileage is only about the same as Canada which contains less than eight millions of people against about 300 millions in India.

Mr. Priestly deplored that the policy of raising the adequate capital in India has been found impossible, and the Government of India, though recognising to the full the importance of the railway system, never gave tangible proofs of encouragements in the shape of funds. He said:—

If no regard is paid to the amount of the capital outlay on new lines and if companies are not only permitted but compelled to construct to a standard entirely out of harmony with the income expected, the new terms cannot prove any more successful than the old. My belief is that the new branch line terms will achieve the object which their framers had in view, and that they will be the means of procuring, without a state guarantee, all the capital required for the construction of new lines in India and of procuring it in ungrudging amounts. If other countries, and even South American republics, can get all the money which they want for railways without a state guarantee, there is no reason why India, with her credit as high as it is, should not be able to get all the money she wants also, if she will only treat a business proposition in a business-like way.

The *Statist* goes a step further. It fully approves of Mr. Priestly's suggestions and trusts that they will receive the careful consideration of the Government and that the impediment to the raising of capital for the construction of branch lines will be removed by allowing railways to be constructed at low cost where the density of the traffic is sufficient to warrant only a small expenditure of capital.

QUESTIONS OF IMPORTANCE.

Mr. T. Palit's Endowment to the Calcutta University.

A special meeting of the Senate was held on June 22 at the Senate House, Calcutta to consider, among other matters, the subject of the munificent endowment of Mr. T. Palit, Barrister at-law, for founding Chairs in Chemistry and Physics and for the establishment of a University Laboratory, and to convey to the founder the thanks of the Senate Sir Ashutosh Mookerjee, Vice-Chancellor, presided and there was a fair attendance of Fellows. Sir Ashutosh in moving that the endowment be accepted with thanks, said :—

Gentlemen,—It is under circumstances of a very exceptional character that this meeting has been convened upon a much shorter notice than is prescribed as the ordinary rule by the Regulations of the University. I feel confident that the course I have adopted will meet with your full concurrence, because we are all equally anxious to express our gratitude for what must be described as an event unique in the annals of this University. Mr. Taraknath Palit has made over to the University property worth more than seven lakhs of rupees for the foundation of two Professorships, one of Chemistry and the other of Physics, and for the establishment of a University Laboratory. The University has been in the past the recipient of munificent gifts from men whose generosity has made their names household words amongst our people. In 1866, Prem Chand Roy Chaud, that prince of Bombay merchants whose portrait now adorns our walls, made over to the University two lakhs of rupees, to be devoted to some one large object or a portion of some large object for which the sum might in itself be insufficient. In 1868, Prosunno Coomarr Tagore, one of the most distinguished Indian lawyers of the last century, whose statue is one of the ornaments of the Senate House, left to the University three lakhs

of rupees for the foundation of a Chair of Law. Many years later, Guruprasanna Ghosh, a scion of one of the best known families of Calcutta, left to the University two lakhs of rupees, for the training of young men abroad in the Arts, Sciences and Industries of Europe, America or Japan. Finally, it is now only four years ago that the Maharaja of Darbhanga made a gift of two and a half lakhs for the erection of a suitable building for the University Library. These and others who have contributed smaller sums are benefactors of whom we may legitimately be proud ; but Mr. Taraknath Palit, by a single stroke of the pen, has surpassed them all, and has placed himself absolutely at the head of the benefactors of Indian Universities. His is the largest single gift by a private individual to an Indian University for the advancement of learning, and, you will not, therefore, be surprised to hear that one of the best European friends of our people, when apprised of the gift, stated that all who have the welfare—not of the University only—but of Bengal and of India at heart, ought to be grateful to Mr. Taraknath Palit.

Mr. Palit has made over to the University about 12 bighas of land and a building, valued at two and a half lakhs, and about four lakhs and sixty thousand rupees in cash. Out of the income derivable from the sum, which will be suitably invested, two Chairs are to be maintained, one for Physics and the other for Chemistry. Upon the land, which lies at a short distance from the Senate House, the University is required to erect and equip a laboratory at a cost of not less than two and a half lakhs of rupees, and to maintain it in a state of efficiency. We are able to supplement the munificent gift of Mr. Palit by two and a half lakhs from our Reserve Fund. The total amount available, consequently, for this great undertaking is a little over nine and a half lakhs. We are thus in a position to take the first step towards the foundation of a University College of Science

and Technology, which will mark an era in the history of education in this country. The Founder states expressly in the trust-deed, which has already been executed and registered, that as his object is the promotion and diffusion of scientific and technical education and the cultivation and advancement of science, pure and applied, amongst his countrymen by and through indigenous agency, the Chairs founded by him shall always be filled by Indians; but the professor elect may, in the discretion of the Governing Body, be required to receive special training abroad before he enters upon the discharge of the duties of his office; he will, during this period, be in receipt of a suitable allowance and travelling expenses which will be deemed part of the cost of maintenance of the Chair. The Governing Body of the College of Science will consist of the Vice-Chancellor as ex officio President, the Director of Public Instruction, Bengal, the Dean of the Faculty of Engineering, four members of the University annually elected by the Senate (two of whom at least shall be representatives of Calcutta Colleges under Indian management and affiliated in Science), four other members to be nominated every three years by the Founder and after his death by the representatives, and finally two representatives of the Professorial staff, to be elected by them annually from amongst themselves. The founder has already nominated on the Governing Body as his first representatives, Mr. Lokendranath Palit, District and Sessions Judge, Mr. S. P. Sinha, Barrister-at-Law, Mr. B. K. Malik, Legal Remembrancer to the Government of Behar and Orissa, and Dr. Niranjan Sircar. The founder has further provided in the trust-deed that the present Vice-Chancellor, if he has not otherwise a seat on the Board, shall always be one of the four nominees of the founder. The Professors will be nominated by the Governing Body, but the ultimate appointment will rest, as required by the University Regulations, with the Senate, subject to the

sancation of the Governor General in Council. The duty of the Professors will be to carry on original research with a view to extend the bounds of knowledge and to stimulate and guide research by advanced students. As an essential preparation for this purpose, it will also be the duty of the Professors to arrange for the instruction of students for the Degrees of Doctor of Science, Master of Science, and Bachelor of Science with Honours. It is an essential feature of the scheme that elementary teaching is not included in the scope of the University College of Science. The University does not desire to encroach upon the sphere of work of affiliated Colleges, work which has hitherto been accomplished with a fair measure of success. Our object is and ought to be higher study and research and we must bear in mind that scholars and investigators engaged in advanced work of this description may not find elementary instruction to beginners congenial, or compatible with the discharge of their legitimate duty. The trust-deed also provides that if the income of the endowed properties should exceed the amount required for the maintenance of the Chairs, the surplus may be applied in payment of scholarships or stipends to advanced students to enable them to carry on research or investigation. This then, is the primary object of the endowment, and to emphasize it, the trust-deed authorizes the Governing Body to admit into the laboratory students exceptionally qualified in any of the subjects of study even though they be not graduates or under graduates of any University.

I have sketched in brief outline the principal conditions upon which the endowment has been created, and it must now be obvious to the most superficial observer that the University is about to take a momentous step in the history of its development. I trust I shall be forgiven if I urge each and every member of the Senate to realize to the fullest extent of the grave responsibility we are

about to undertake. The establishment of the University College of Science for purposes of higher study and research will tax our energies and resources to the utmost; we must all, individually and collectively, exert ourselves for the success of this great cause, and make the Institution worthy of the Founder and worthy of our reputation. Let us fervently hope that the noble example set by our benefactor will inspire others to emulate his liberality and thus to crown our efforts with speedy and unqualified success. I now move for your acceptance the recommendations of the Syndicate.

(1) That the munificent donation of Mr. Palit be accepted with thanks on the terms mentioned in the trust-deed. (2) That two Professorships be instituted, one to be called the Taraknath Palit Professorship of Chemistry, and the other the Taraknath Palit Professorship of Physics. (3) That on the land given to the University by Mr. Palit, a University Laboratory be erected, to be called the Taraknath Palit Laboratory.

The motion was seconded by Khan Bahadur Moulvie Mahomed Yusuf, and carried with acclamation.

UTTERANCES OF THE DAY.

The Hindu University.

Pandit Bisban Narayan Dar made the following speech as chairman of the public meeting at Almora :—

Gentlemen,—You have done me a great honour by electing me as your chairman, for which I thank you most heartily. Some of you perhaps will be surprised to hear that, as I am ashamed to confess, this is the first time I have attended a meeting held in connection with the Hindu University scheme. This has not been due, I assure you, to any indifference on my part to the great cause with which the name of my old and esteemed friend Pandit Madan Mohan Malaviya has been so honourably associated from the very beginning, and upon the successful issue of which depends in no small measure, in my humble opinion, the welfare and advancement of the Hindu race, but owing to some unfortunate circumstances which have prevented me from being of any service to anybody and which nobody laments more than myself. It is however a piece of good fortune to me that the Hindu University deputation headed by its distinguished leader has come to this town that I am thus afforded an opportunity of giving a public expression to my sincere and heartfelt sympathy with that great and patriotic movement. Any expression of opinion proceeding from an individual like me cannot mean much but I remember the words of a great German philosopher: "My conviction gains infinitely as soon as another man begins to believe in it," and I therefore believe that the opinion of the humblest of men sometimes serves a useful purpose in the economy of our social life. It is in this modest hope that I venture to offer a few observations for your kind and careful consideration.

a hearty response from the whole country. These are hopeful signs and point out to us an urgent duty in improving the prospects of education for our own community.

So far as this university question is concerned the Hindu community is on its trial. The Government is watching you, other rival communities are watching you, now is the time for you to exert yourselves in a noble cause and to show to the world of what stuff you are made. Those who are religious teachers must show themselves worthy of their high calling and worthy of the confidence of their fellowmen by showing their sympathy with knowledge, by aiding a movement which makes religious and moral instruction one of its cardinal objects. The aristocratic leaders must prove their claim to the allegiance and loyalty of the masses by taking interest in the mental and moral welfare of the masses. And the masses themselves must show that they are fit to enter upon the heritage of knowledge from which they have so long been excluded. They must show by words and deeds that they are in earnest in urging their claim and are prepared to make some sacrifice for raising themselves to a higher social and intellectual level. We have indulged too much in verbal sympathy, let us prove its sincerity by deeds. Upon young and old, upon rich and poor, upon Hindus of all persuasions and beliefs, lies a great national duty. Let us perform that duty with devotion, with firmness, with promptitude, and vindicate the fair name of our holy Motherland.

INDIANS OUTSIDE INDIA.

Hindus in Canada.

Mr. Walter W. Baer, Editor of the *Victoria Times*, contributes the following to the *Canadian Courier* :—

State interference by regulation of Oriental immigration began with the imposition of a head tax of \$ 50 on every Chinese entering the country. That was long ago and before we had any suggestion of trouble with Japanese immigration. The modest tax did not decrease the immigration; it only raised the wages charged by Chinese bosses for Chinese servants and labourers. As a concession to White labour it was raised to \$ 100 and again to \$ 500 much to the discomfiture and dissatisfaction of the corporations and contractors employing cheap "labour."

It was at the time of, or shortly after, the imposition of the \$ 500 tax on Chinese that some brilliant-minded white man made the discovery that, because of Treaty relations between Great Britain and Japan, no head tax had been imposed on Japanese. These must be classified and admitted on the same terms as required by the general Immigration laws of Canada. In the middle of the first decade of the twentieth century an influx of Japanese began. They came in hordes and there was consternation in the ranks of organized labour. The excitement was indescribable and finally culminated in the Oriental riots in Vancouver in the winter of 1907. The news of those was unconsciously exaggerated in the Eastern press for, though I slept in the heart of Vancouver the night the riots occurred I know nothing of them until I reported for duty at my desk the next day. But there is no denying that the demonstration against the Orientals was exciting and the feeling ran higher than it had done before,

Singularly the Hindus were themselves the first to learn the moral of the situation. Many went back to India, but they carried the tale of the land of opportunity and fired the imaginations of a better class of His Majesty's subjects. These organized for legitimate and prospectively successful emigration to Canada and, since that time, there can be little objection to the class of men who have come to us "From India's Coral Strand." I say "little objection" using the term in comparison with the Oriental immigrants who are regularly permitted to come to this province and whose admittance into the country is accepted as a matter of course. I challenge contradiction of the statement that the Sikhs who are taking the places of Japanese and Chinese as well as Montenegrin labourers in British Columbia are superior, physically, mentally, morally, socially and every other way to the races I have enumerated.

Those who have come since their advisers in India have been here, inspected the conditions and are directing their emigration are, in my opinion more desirable than any class of Orientals or Asiatics of which we have had experience.

You will ask me then, what is the meaning of all this hubbub and objection to their demands. *The Hindu thinks he has as good a moral right to come into this country, to improve his fortunes as any race with the additional claim upon us that he has fought the battles of the British Empire; that he is already naturalized by instinct and that, whatever else he may do he will never become anything else but a British subject ready as ever to fight for his King Emperor.*

We allow the Chinese to bring his wives so long as he pays the head tax. I know rich Chinese who have six wives in Coast cities. No one interferes with them; they are even then quite as monogamous as some of the Europeans who would legislate them into monogamy. The

Japanese may bring his wife—or what is quite different—any kind of a Japanese woman and no one says him nay. The Sikh who is essentially domestic wants to bring his wife—not wives—and children and set up a hearth stone in his adopted country. The Sikhs are not polygamous. No student of Indian domestic relations will affirm that of any Hindu excepting Mahomedans, and I do not know of any of these though there may be a few in the country. Polygamy is against our laws and it will surely be no more difficult to control the Mahomedan, Hindu than it is to control the Mormon.

The Hindu will, in time, displace the Chinese if he is given equal opportunity and an impartial chance in this country. Why, then, the strenuous objection to his admission? Because it requires relaxation of a rigorous law and any relaxation of the laws making difficult Asiatic immigration is impossible of tolerance by the labour organizations. These proceed upon the theory that, if the wives of Hindus are admitted a precedent will be established and ours will no longer be a "White Canada."

It is not a question for politicians, it is a question for statesmen. It is wholly an economic question and as such can never be dissociated from its ethical features. But I must add yet this last word—the Eastern press which stigmatizes the Sikhs by stating that they are polygamous, thieves, libertines, drunkards, lawless or dangerous to society are doing them an injustice which is inspired only by an utter ignorance of the facts. They are no more so than men of white skin and European blood.

FEUDATORY INDIA.

The Nizam's Legislative Council.

The creation of Legislative Councils is one of the notable features of the experiment of popular representative government being carried out in Native States. Quite recently the Legislative Council of the Nizam's State witnessed an advance of the popular element. A new hall has been constructed for the housing of the Council. At the opening ceremony, an address was presented to His Highness the Nizam in which a request was made that the strength of the non-official element in the Council till now 8 be the same as that of the official, viz, 11 members. This request was granted. In reply to the address on behalf of His Highness, the Prime Minister said:—"As the Council has performed its duties in a commendable manner I sanction for the present as an experimental measure for six years the request that the number of official members being now 11, apart from the President and Vice-President, the number of non official members shall be equal to the official members, viz, 11. As regards the three members thus added to the non-official class, the Municipal Committee will have the right of selecting one of them, and the remaining two will be selected by the Local Boards of the Sudhas in turn. This order is to be in force for six years after which it is thought proper to confirm the arrangements. The necessary alterations will be made in the rules of the Legislative Council." This advance in popular representation so readily sanctioned by the Government of His Highness reflects credit on the liberal nature of the administration.

Education in Baroda.

According to the latest census, the number of inhabited villages and towns in Baroda State is 3,095. Of these as many as 2,138 have got facilities for primary education provided for them. The Deputy Educational Inspectors were specially asked this time to collect information according to the figures of the last census, and from their reports it seems that out of 937 villages which have no schools, 82 villages send their children to schools neighbouring villages and there are 756 villages in which schools cannot be opened owing to a variety of reasons, the most important of them being the want of sufficient population. Most of these villages are found in tracts inhabited by aboriginal and backward people who, as a rule, live in scattered cottages. For instance, in Sankheda and Songad Talukas as many as 113 and 156 villages are respectively reported to be such as would not form a small school even of 15 children.

It was said in the last report that all villages having 1,000 or more population had the benefit of having Government schools, whereas in smaller villages village schools existed. It was, however, found that some villages having more than 1,000 souls had village schools. The reason is that before primary education was made compulsory in Baroda, the Department opened schools in purely Government villages, and the alienated villages, though they had large populations in them, were left untouched. Since the compulsory primary education measure was applied to all the villages, the Local Boards opened village schools in such alienated villages. Now, however, as the distinction is made to disappear, the fact does not call for any special comment.

Out of the total population of 20,29,320 souls, a population of 18,62,044 had primary schools provided for them. The total percentage of pupils to the population of town and villages having schools was 9.5.

Native State Stamps.

A unique collection of Indian Native State stamps has been sold by the Alliance Commission Agency by auction at Simla and several lots fetched good prices. A book of fourteen Afghan stamps was sold for Rs. 30 while Bhopal stamps secured Rs. 50. A Jhind lot fetched Rs. 25; while Holkar and Las Bela lot fetched Rs. 80. A stamp album comprising a magnificent collection of over 1,500 British and Colonial postage stamps was sold for Rs. 650. There was also a collection of old and rare books for sale including a copy of the Lamasist "Translation of Doctrine of Buddha," said to have come from the Potala at Lhasa. It consists of 479 hand-written pages on vellum or parchment illuminated and embossed after the style of old Western Monastic breviaries and enclosed in two exquisitely carved wooden covers illustrative of the several sublimities of Gautama.

Alphabetical Aristocracy.

Many Zamindars spend large sums of money in various ways to earn the title of Maharaja Bahadur and do not realize the fact that at best they but constitute what may be called a mere "alphabetical aristocracy." These titular Maharajas and Maharaja Bahadurs fail to see the obvious facts that between them and the genuine Maharajas, the ruling princes and chiefs, there is a world of difference, which would strike them at once were they to visit any of the large Indian States. It should be obvious to the meanest understanding that unless a Maharaja is a ruling chief, his title is absolutely meaningless. As a rule, such titles here are not hereditary and so there is no resemblance to the peerage of the United Kingdom. A son of titular Maharaja or Rajah may sport the title of Kumar as a prefix but he generally lapses back into the rank from which his father or grandfather rose. The higher Indian titles thus constitute not only an alphabetical but a more or less evanescent aristocracy, floating as the breadth that calls them forth,—“Beharee”

The Begum of Bhopal.

In the course of its review of the Begum of Bhopal's autobiography, the *Pioneer* says that the stock of the Begum is Afghan and her creed Mussalman: both make for independence of character and mental discipline. Further on referring to the late Nawab consort, Sidik Hasan Khan it says.—He was a bigoted Mussalman with theological tastes and a leaning to the Pan-Islamic movement. His influence over his wife Nawab Shah Jehan Begam was great, and it was exercised to promote his own advancement and that of his friends and kinsmen. From 1871 to 1886 the consort overshadowed the throne, and the affairs of the State went from bad to worse. In the latter year he was removed from office and stripped of all dignities by the British Government, and the Begum was given the temporary help of an experienced English officer as minister of State.

Infant Marriage Prevention Act in Baroda

According to the Census Commissioner of Baroda the Infant Marriages Prevention Act has not been much of a success. The *Times of India* thus summarises his views thereon. In the ten years under review no less than 22,218 applications were made for exemption from the provisions of the Act and 95 per cent. of them were allowed. Over 23,000 marriages were performed even without this formality of an application for exemption, in violation of the Act. The parties responsible were fined from a few to a hundred rupees, and the Superintendent thinks that there must have been an equally large number of marriages which were connived at by the village patels who are also the marriage registrars. The age returns are notoriously unreliable, but even thus there were 158 per thousand males and 277 per thousand females, married and widowed, under 10 years of age while the legal minimum ages are 16 and 12 for boys and girls respectively.

Mysore Economic Conference.

Of about thirty Resolutions passed in the Mysore Economic Conference for the consideration of the Government, the following are the more important:— (1) that a central State-aided Bank, to be known as the Bank of Mysore, be established; (2) that steps be taken to revive the hand-made paper industry of the Province; (3) that the Industries Committee be asked to conduct a preliminary investigation with a view to establishing in the Mysore State a Chemical and Pharmaceutical Works for the manufacture of acids, tinctures, extracts, etc., on modern lines; (4) that the Conference is in favour of the imposition of fresh taxation, including an income-tax, by Government, to augment the revenues of the State to meet the various items of new expenditure proposed by the Conference Committees; (5) that additional taxes be levied in a manner that appears most suitable to Government solely for the expansion of primary and industrial education. The Conference expressed its opinion that the distribution of taxation in the State is not as reasonable as it might be, and that there are grounds to think that the wealthier classes do not contribute to the State Treasury in due proportion to the protection and benefits enjoyed by them; (6) that the economic condition of about ten typical villages in each district be investigated by an Agricultural Committee to ascertain the indebtedness of the ryot and (7) that a Mysore University be established on the lines recommended by the Education Committee.

Sanitary Service in Mysore.

The Mysore Government is to be congratulated on its decision to open a School for Hygiene at Bangalore for the training of candidates as Sanitary Inspectors for the State. The institution will be started tentatively for two years and it is proposed that only those who have passed the special course of hygiene will be employed as Sanitary Inspectors in the State.

Bhavanagar Famine Fund.

On the birth of a heir to the Throne of Bhavanagar, H. H. the Maharaja, among other boons, has decided to create a famine fund of Rs. 20 lakhs, beginning with an initial grant of Rs. 5 lakhs and an annual contribution of 2½ lakhs, the interest from which will be devoted to the relief of the agriculturists. Rs. 20,000 yearly will be devoted for sinking wells free of cost and the remaining amount will be accumulated to give free grants in lean years which occur every ten years.

Caste and Labour in Baroda.

From the published census-volume for the Baroda State, we learn that only 5 per cent. of the Ahirs in that territory now are following their ancestral avocation of cattle breeders and graziers. Only 8 per cent. of the Bahrots now are bards and genealogists. The larger proportion of Kunbis are engaged in occupations other than agriculture. A section of the Kolis have abandoned their traditional menial labour and have acquired some skill in brick making; they have thus risen in the general social scale and are treated as Rajputs. Some of the despised Mochis, who were leather-workers, have learned other occupations which are regarded more respectable by caste Hindus, and have thus acquired more respect from their fellow Hindus. In particular, those who have become spangle-makers, painters and electro-platers, have broken off all connection with their original caste and have formed what are practically separate castes of their own.

Shakespeare's Chart of Life.—Being studies of King Lear, Macbeth, Hamlet and Othello. By Rev. William Miller, LL.D., C.L.E. Rs. 4. To Subscribers, Rs. 3.
Morley's Indian Speeches. An enlarged and up-to-date collection. Price Rs. 1. To Subscribers, Rs. 12

INDUSTRIAL AND COMMERCIAL SECTION.

Indian Pig Iron.

India has entered upon a new phase in her commercial development and is now, thanks largely to the existence of the Tata Iron and Steel Works, a promising exporter of pig iron. During the past couple of months we have shipped over seven thousand tons of this commodity from Calcutta to foreign countries. One of our most promising customers in this connection being Japan, which is now hard at work building ships of all sizes for commercial use and for naval purposes as well, and so requires pig iron in wholesale quantities wherewith to manufacture the steel she requires for the hulls of her commerce carriers. It is quite evident that India's exports of pig-iron this year will establish a record, to be broken, it is hoped, annually as successive years roll by. It is high time, that India should become a large exporter of manufactured articles. At present our chief exports are raw materials which could, in most cases, be just as well converted into finished materials in this country as in any other. But the fashion has been to export our raw material and to import manufactured articles. But all fashions change sooner or later and India's manufacturing day is beginning to dawn.—“Pioneer”

Indian Railway Traffic.

The Administration Report on the Railways in India for the year 1911, shows a continuous increase of the passenger traffic. The total number of passengers carried has increased from 31,158 millions to 38,986 millions, and the total earnings amount to Rs 184,408 lakhs, against Rs 171,204 lakhs. The number of third class passengers carried is more by 1602 millions and the earnings therefrom by Rs 10,709 lakhs. The total number in railway employ at the close of the year was 563,030, of which 7,699 were Europeans, 9,877 Anglo Indians, and 545,454 Indians.

Paper Making in the Punjab.

The main industry of the Punjab is paper making and the whole output is consumed by Government departments. The paper factory last year yielded a profit of Rs. 31,444. The demand was brisk, at times greater than the supply, and special arrangements had to be made to avoid inconvenience. All the same, the paper is not at all popular according to the administration report.

Enlightened form of Swadeshi.

Sir Theodore Mouison, lecturing before the Indian Guild of Science and Technology at the King's College, answered the various objections to the system of sending Indian students abroad for Technological studies. He had great faith in attacking the problem of Indian economic development through the educated classes. They were alert and appreciative of the new ideas and success among them was reproductive in the ideas initiating movements and thought. Admitting that difficulties existed in finding suitable avenues for the technically trained Indians, he said that they had a right to ask their countrymen for more practical sympathy and a new and enlightened form of Swadeshi. Indians should invest more largely in well-managed concerns, and when they held a majority or a considerable portion of the shares, they should urge the Board to take on Indians as juniors in posts of control and thus promote Indian development and open up avenues of employment for their sons.

Silk Culture at Shillong.

An experiment in silk culture at Shillong is to be tried, with Government sanction, by the Roman Catholic Mission. The Orphanage Mission will provide a rearing house, and the Agricultural Department, which has previously conducted the experiment, will provide an expert to conduct the operations as well as a free supply of mulberry leaf. The silk produced will be sold for the benefit of the Mission.

American Cotton for Bombay.

During the past two months over 25,000 American cotton bales have been landed at the docks in Bombay and the last portion of this cargo is now being shifted out of the docks. An *Advocate of India* representative called upon one of the leading cotton merchants in the city, where he ascertained that the cause of such a quantity of American cotton coming into Bombay was chiefly due to the price of the Indian staple having gone up very considerably. About three months ago, at the time of indenting on America, the Indian cotton rate was Rs. 369 per 7 cwt., and rather than pay such a high price for an inferior quality those concerned in the great cotton trade of the East placed large orders for the American product, which, for the same price, gives them better staple. Now the rate of Indian cotton has fallen to Rs. 206 a difference of Rs. 73 per 7 cwt. This makes an enormous difference in the profits of large consignments. There have also been large quantities of American and Egyptian long staple seed coming into Bombay with consignments of American cotton. But these consignments were chiefly for Government for experimental growing in Khandeish and Sind.

Pottery Industry in Bombay.

In connection with the Sir George Clarke technical laboratories and studios, a pottery department has been founded by the Government of Bombay, to develop the pottery industry in India by means of scientific research in connection with the materials used in the production by introducing the mode in the methods of manufacture and by improving the quality of designs used by potters. To carry this out, a small permanent staff is employed. Attached to the department is the school in which students are trained. Particulars regarding the course of training, are published in the *Bombay Government Gazette*.

Damping of Cotton: A Penal Offence.

The International Cotton Committee, has issued a report recommending that bills should be introduced into the Indian Legislatures making the damping of cotton a penal offence, that tenants leasing land alongside irrigation canals should give an undertaking to devote a certain proportion of the land to cotton cultivation under the direction of the respective agricultural departments, that seed farms should be established in all cotton-growing provinces, that the agricultural departments of India be recommended to obtain the statistical values of crops on the lines adopted in the United States.

Industrial Co-operation.

Discussing the possibilities of co-partnership as a means of securing a more settled state of affairs in the industrial world, the *Nation* observes: If harmonious conditions do not everywhere prevail human folly, not the wage system is to blame. But this essential harmony is consistent with a good deal of discord and divergency of interest wherever the product yields a margin over and above these necessary costs. Wherever skill, or prosperous times, or some advantage of process or of market makes a business exceptionally profitable, labour naturally seeks to get a share of these profits, and trouble may arise. Why, then, not bind the interests of capital and labour more closely, by securing for the workers some share in the profits, or even some share in the capital that earns the profits? During the last half century a considerable number of detached experiments have been made along these lines, and not a few politicians and business men are favourably disposed to this escape from the dreadful prospect of incessant strife which otherwise they see before them. . . . But before we can accept profit sharing or co-partnership as a main road to industrial peace, we must have clearer testimony to its applicability by ordinary men of business to ordinary businesses.

The Wheat-crop of India

The final figures relating to the wheat-crop of India this year are of more than ordinary interest. Although the total area is returned as being 103,000 acres under the figures for 1910-11, and the total outturn is 227,000 tons less, there are other compensating aspects. Thus, the Punjab returns an area of 10,448,000 acres, being an increase of 467,000 acres, or 4.7 per cent., over the final estimates of the preceding year. It may be noted that the Punjab wheat area is 34 per cent. of the whole of India. It is considered that but for the rain at the end of March, which delayed harvesting and damaged the standing crop to some extent, the outturn would have been very much larger. It is expected that in quality this year's crop is much better than last year's. The United Provinces also return an increase in area as well as in outturn. In this area the wheat acreage is 7,578,000, being 3.2 better than last year; while the outturn is 112,000 tons better. These are the two great wheat-growing regions of India. The Central Provinces and Berar, Central India, Behar and Orissa, the N. W. Frontier Province, and the Bombay Presidency come next in the order named, but a very long way behind the Punjab and the United Provinces. With the exception of Central India, the N. W. Frontier Province and Mysore, all the other parts return large decreases under area and outturn. The exports of Indian wheat to foreign countries continue to increase. From 880,459 tons in 1907-08, these rose to 1,361,176 tons in 1911-12.

Sea-borne Trade of the Madras Presidency.

The total value of the sea-borne trade of the Madras Presidency for the last official year showed an increase of one crore and five lakhs of rupees or two per cent. over the record figure of the previous year.

Instructing Juvenile Prisoners

The report on the Prison administration of Burma for the year 1911 shows that juvenile prisoners at Mierktla were given instruction in such trades as carpentry, bamboo and cane work, shoe-making, tin-smith work, polishing, sawing timber and blacksmith and wheelwright work. The Inspector General of Prisons, Burma, says that there is a fair market for the sale of bamboo and canework, and several of the boys became quite proficient. All the boys who had been taught sawyer's work, he adds, were released at the time of the Delhi Durbar. It is now proposed, where a sufficient number have been taught shoe-making, to employ an instructor in sawing. In carpentry the principle followed is to impart instruction so that each boy should be able to turn out a complete finished article. In Rangoon also some of the juvenile prisoners were taught carpentry and we find that His Honour the Lieutenant Governor of Burma has sanctioned a proposal to supply each one with set of tools wherewith to continue his occupation on release. But we think giving instruction in various trades, while in jail, is not sufficient. Unless the released juvenile prisoners are helped in the matter of their earning an honest livelihood, such instruction cannot be of any use to them.

India's Trade and Commerce.

The accounts relating to the foreign seaborne trade of India for April 1912 show a considerable increase over the figures for the corresponding month of last year. The value of the imports was Rs. 13,66,09,595 against Rs. 10,450,772 for April 1911. The value of the exports for the same month was Rs. 11,20,54,407 as compared with Rs. 20,48,91,880 in April 1911. These figures are exclusive of Government stores and treasure, both Government and private. The increase in imports occur chiefly under ale, beer and porter, sugar, salt, tobacco, coal, mineral oils and cotton goods.

Indian Paper Industry.

It is a well-known fact that paper manufacturers in India cannot compete with those of Europe, the reason being that a large number of paper mills import from foreign countries such as Germany, Sweden, Norway and America wood pulp for manufacturing paper instead of preparing the material here. The pulp is imported in the form of pressed bales and contain no waste product and has been found more economical. The experiments for manufacturing pulp in India have been found comparatively costly, because instead of manufacturing it at the place where suitable raw materials are obtainable in abundance, these latter have been brought down to the place of paper manufacture, thereby costing heavily in railway freight and transport charges. With a view to conduct the processes of converting the raw material into pulp in the jungles where they are available, and to minimise the cost of transport, a company has been recently registered in Lucknow, styled the Baib and Wood Pulp Manufacturing Company. It may be here stated that *baib* is the name of a grass which yields good pulp for manufacturing paper and grows in abundance near the regions of Nepal terai. It is to be hoped that this new venture will lead to the development of the paper industry in our provinces.

Facilities for Manufactures.

We understand that the Madras and Southern Mahratta Railways refer to a loss of Rs. 8,000 and 16,000 respectively on the transport of Indian twist and yarn and on that of Indian piece goods while pointing to the profits earned by European twist and yarn and by European piece goods. That is tantamount to giving the dog a bad name and hanging it; but in order to be fair the Company should first quote concession rates to attract traffic.

Cigarette Industry in India.

The increased duty imposed on imported tobacco in 1910 resulted in a great impetus being given to the indigenous cigarette industry, and in spite of the reduction of the duty on the commodity in March 1911, it has not been able to recover lost ground. We learn from *Commerce* that in Bengal during the last year there was a decrease in the number of imported cigarettes from 150 to 128 millions. The rapid growth of this industry in India can be gathered from the fact that at Monghyr, where one of the great cigarette factories is situated, the despatches by rail of cigarettes in 1907 were 7½ tons in 1910 they were 1186 tons, and in 1911 they reached a total of 2,828 tons. In spite of these large outturns, Bengal factories are reported to be unable to cope with the demand. The area of land under tobacco cultivation in the whole of India is over a million acres, and the value of the crop produced is roughly valued at Rs. 75,000,000. At present only an inferior quality of tobacco is grown in India. But it is expected that as the result of experiments a superior quality will be introduced, leading to the still rapid development of the industry.

British Steam Navigation Company.

In their Annual Report the Directors of the British India Steam Navigation Company recommend dividends at 5 per cent. on the Preference stock, and 7½ per cent. on the Ordinary shares for the year ended the 31st December, 1911. It is also stated that the sale of ten old steamers and the disposal of some property which the Company was obliged to part with under the Land Acquisition Act at prices in excess of the value at which they stood in the Company's books, together with the result of the year's operations and freedom from serious accident, have enabled the Directors after providing for depreciation, to add £500,000 to the reserve and insurance funds, making them up to £1,152,735.

AGRICULTURAL SECTION.

The Opium Question.

In the House of Commons Mr. Edmund Harvey asked whether the Government of India had yet given orders for the sowing of opium poppies for the current year, and whether in view of the surplus supply already consigned to China and the recent petition of Indian merchants, the Government of India would not issue any further instructions for sowing.

Mr. Montagu said that the Secretary of State for India was communicating with the Government of India and the Foreign Office. With regard to the situation created in Shanghai through the failure of the provisional Chinese Government and provincial authorities to observe the agreement, both as regards restriction of cultivation in China and the admission of certificated Indian opium, the Government of India had already announced that the licensed area for cultivation in British India would be largely reduced this year, in pursuance of the policy of progressive reduction, and it was not proposed to instruct them in the sense suggested.

Cattle Diseases.

The Commission, which was appointed by the Board of Agriculture sometime ago, to inquire into the prevalence of foot and mouth disease among cattle, will be sent out to this country, and may be expected to visit India about September next. The commission will be a small one, consisting of a couple of specialists who will have associated with them in their work out here Major Holmes, Director of the Imperial Bacteriological Laboratory, Mukhtesar. They will investigate the conditions and extent of the disease among cattle in India working for sometime at the laboratory. It is hoped that the knowledge gained out here by the commission will be valuable to the Board in their measures for combating the disease among cattle at home.

The World's Agriculture.

The May number of the *Bulletin of Agricultural Statistics* has just been issued by the International Institute of Agriculture in Rome. The figures published in April with regard to the areas sown to winter cereals in the Northern Hemisphere are confirmed in the May number, additions having been made in the form of the areas sown in Italy and the area of wheat abandoned in the United States and Canada. The weather during April has had a somewhat unfavourable effect upon vegetation, with the result that development is in general rather backward. The condition of the crops, however, on the 1st May was, for the greater part good, except in the United States where the condition figure was below that of the corresponding period in 1911. The germination of spring wheat, rye, barley and oats, has been, on the whole, uniform except in Austria. In the May *Bulletin*, flax has been included for the first time in the list of products considered, information having been received in May from Belgium, Bulgaria, Ireland, Hungary, Italy, Roumania, Japan, and India. The general condition of the flax crop is good, the areas sown being as follows:—Belgium, 13,300 hectares, Italy, 8,000 hectares, India 1,402,135, hectares as against 1,255,115 hectares, sown last year. Another culture considered for the first time in this number, is silk worm rearing, information also being given as to the condition of the mulberry trees, which was satisfactory in Austria, Croatia and Slavonia, and Japan, and bad in Italy. The quantity of silk worm eggs placed for incubation was in Austria 29,414 cxx, of 30 to 35 grammes; in Bulgaria 14,336 hectogrammes or 96 per cent. of last year's figure; and Japan 591,000 hectogrammes, the latter being 102 per cent. of the amount placed for incubation last year. Information is also given in regard to vineyards, the vines having suffered in Austria, France, Hungary and Italy.

Departmental Reviews and Notes.

LITERARY.

A NEW BOOK BY S. M. MITRA.

Next month Messrs. Longman & Co. will publish a new volume by Mr. S. M. Mitra, entitled 'Anglo Indian Studies,' including Chapters on 'The Unrest,' the Press, the Native States, and lives of the three Indian statesmen, Sir Salar Jung, Sir T. Madhava Rao, and Sir Dinkar Rao. A leading feature will be a discussion of the views of Sir R. Jendra Nath Mookerjee, who believes that the industrial progress of India lies in European co-operation.

A PLEA FOR CHEERFUL LITERATURE.

In the course of an after-Dinner Speech at the anniversary of the Literary Fund Society the Rt. Hon. Mr. Balfour observed :—

What I ask from literature mainly is that in a world which is full of sadness and difficulty, in which you go through a day's stress and come back from your work weary, you should find in literature something which represents life, which is true in the highest sense of truth, to what is or what is not imagined to be true, but which does cheer us. (Cheers.) Therefore when I ask you, as I now do, to drink the toast of Literature, I shall myself *sotto voce*, as I drink it, say not literature merely, but that literature in particular which serves the great cause of cheering us all up. (Cheers.) I couple the toast with the name of one of the most distinguished of living critics, my friend Walter Raleigh. (Cheers.)

IN ABOR JUNGLES.

General Bower's recent expedition across the frontiers of North East India has found its historian in Mr. Argus Hamilton, who is bringing out a book on the political as well as military results of the expedition with the title "In Abor Jungles." Mr. Eveleigh Nash is the publisher.

LIFE IN THE EAST.

Mr. and Mrs. Sidney Webb are writing a book on some observed phases of life in the East. It will deal with some sociological and economic conditions of the countries they have visited, and will include a chapter on India.

CARDINAL NEWMAN'S CHARACTER.

Mr Wilfrid Ward, in the *Dublin Review* for April, supplements the picture that he has given of the great Cardinal by a special study of his sensitiveness. He says of Newman :—

His taste for wine was so delicate, though he drank it sparingly, that he chose the wines for the Oriel cellars. His musical ear was keen, and music was such an intense delight to him that when he played Beethoven's quartets on the violin, after an interval of some twelve years, he broke down and sobbed aloud, unable to go on. His sensitiveness to smell is apparent in a well-known passage in "Loss and Gain."

This extraordinary physical sensitiveness was the counterpart to his sensitive intellectual perceptions (if the phrase may be allowed), and to his spiritual perceptions. In this latter sphere his sensitiveness gave an insight which, to the believer, was almost miraculously true; yet to the unbeliever his 'intuitions' appeared to be the suggestions of a morbid fancy.

He realised the mind of an Agnostic and the force of the reasons which affected it to a degree which alienated the sympathy of the orthodox, who could not tolerate the notion that unfaith was so plausible. Yet his profound conviction of supernatural truth made him completely out of sympathy with the unbelievers with whose thoughts he was, nevertheless, in closest and most understanding touch.

Personally I think that a profound consistency of view is apparent under all the subtle variations of mood and the interaction of his estimates of different aspects of each case.

EDUCATIONAL.

STUDY OF ORIENTAL CLASSICS

The Government of India have awarded the two State scholarships available in 1912 for the scientific study of Arabic and Sanskrit in Europe to Munehi Abdusattar Siddiqui of the United Provinces and Pandit Tarachand of the Punjab, respectively.

INDIAN STUDENTS IN THE WEST

Lord Crewe has appointed a Committee to enquire into the facilities available to Indian students for industrial and technological training in England with special reference to the system in connection with the State technical scholarships in 1904.

The Committee is composed of Sir Theodore Morrison, Sir Krishna Gupta, Mr Reynolds, late Principal of the Manchester Municipal School of Technology; and Professor Daly, of the Imperial Science College, South Kensington.

It is understood that the Committee will visit University centres in the United Kingdom and hear evidence of professors and others on whose co-operation the success of the system depends.

There are now 27 State scholars undergoing instruction here, in America and on the Continent.

Though it is believed that the system rests on a sound basis, it is held that it may be capable of improvement. It is recognised that if the full benefit that may be derived by scholars and Indian industrials is to be obtained, there must be a somewhat wider and more systematic survey than hitherto of existing facilities in England.

The difficulties of meeting scholars on returning to India are matters for investigation here and not in England, and the present enquiry is regarded as a preliminary to a full examination of the system by the Government of India.

PROF. HENDERSON.

The next Barrows Lecturer to India is to be Prof Charles R. Henderson, Ph. D., Head of the Department of Sociology in Chicago University. The *Dnyanodaya* has the following appreciation of him in its last issue. In his own department of Sociology Prof Henderson is one of the foremost experts in the United States. In 1909 he was appointed by President Taft as the Commissioner for the United States on the International Prison Convention, and when the Eighth International Prison Congress met in Washington in 1910 he was elected its President. He has been Chairman of the American Section of three international associations, viz, the International Union of Criminology, the International Workingmen's Insurance Association, and the International Conference on Unemployment. He was appointed by Congress as a member of the International Committee on Public and Private Relief. In 1908-1910 he was Secretary of the Illinois Commission on Industrial Diseases. He has been President of the National Conference on Charities and Correction, President of the American Prison Association, and President of the American Association for the Study and Prevention of Infant Mortality. As a writer his activity has been correspondingly extensive and prolific. Besides numerous occasional articles in the scientific journals of America, France and Germany, Prof. Henderson is Associate Editor of the "American Journal of Sociology" and Contributing Editor of the "Journal of the American Institute of Criminal Law and Criminology."

THE STUDY OF SANSKRIT.

The Syndicate of the Madras University has submitted proposals to the Government for utilising the recurring grant of Rs. 65,000 and the non recurring grant of Rs 4 lakhs made to the University by the Government of India. The Syndicate is understood to be anxious to promote the critical study of Sanskrit.

LEGAL.

A QUESTION OF HINDU LAW.

The full bench of the Allahabad High Court, consisting of the Chief Justice and Justices Chamier, Banerji and Tudball, have decided an important point in Hindu law on the question whether all existing members of a joint Hindu family should not be impleaded as parties in mortgage suits affecting the joint family property. Their Lordships unanimously held that the question is not one of procedure but of substantive law and under Hindu law the father or manager represents the family and may sue or be sued as such. So, though it is desirable to have all coparceners before the Court, yet no suit ought to be dismissed because some of the junior coparceners have not been impleaded. This over-rules a previous Full Bench ruling.

JUDICIAL APPOINTMENTS IN BOMBAY.

The following reply has been sent to the President and hon. secretaries of the Bombay Presidency Association by Mr. C. A. Kincaid, Secretary to the Government of Bombay :—

Gentlemen,—With reference to your letter of the 28th April, 1912, submitting a representation on the subject of appointment of judges to the High Court of Judicature at Bombay, I am directed to inform you that the representation has this day been submitted to the Secretary of State for India as requested. I am, at the same time, to state that there is at present no vacancy in the High Court, which requires to be filled up. When, however, such a vacancy occurs, the best candidate available at the time will be recommended for appointment by His Majesty within the limits of the Statutory provisions. I am to add that in selecting a person for appointment as a judge of the High Court success at the Bar is taken into due account, but it is regarded only as one of several necessary qualifications for the appointment.

THE NEW COPYRIGHT ACT.

The Copyright Act, 1911, came into operation in the United Kingdom on the first day of this month.

The Act defines copyright as the sole right to produce or reproduce a work or to perform or deliver it for lecture in public, and if the work is unpublished the right to publish it; and it includes the sole right to produce any translation to convert a dramatic work into a novel or other non-dramatic work into a dramatic work. A report in a newspaper of an address of a political nature given at a public meeting is not to be an infringement.

The term of copyright is to be the life of the author and fifty years after his death, but at any time after twenty-five years, or in the case of an existing copyright after thirty years, from the death of the author it may be reproduced for sale if the reproducer proves that he has given a prescribed notice in writing of his intention to do so and has paid to the owner royalties at the rate of 10 per cent. on the price at which he publishes the work.

The Judicial Committee of the Privy Council at any time after the death of the author, on a complaint being made that the owner of the copyright has refused to allow the republication or the performance in public of the work, and that by reason thereof the work is withheld from the public, may order the owner to grant a licence to reproduce the work or perform the work on such terms as they think fit.

In the case of joint ownership the term is for the life of the author who dies first and fifty years afterwards, or the life of the author who dies last, whichever period is the longer.

Copyright in Government publications is to belong to His Majesty and to continue for fifty years from the date of the first publication.

The term in the case of photographs is to be fifty years from the making of the original negative,

SCIENCE.

MR. ALLEN ABRAHAM.

Mr. Allen Abraham, B. A., Professor of Mathematics in the Jafna College, has been honoured with the title of Fellow of the Royal Astronomical Society of England on account of his original work in calculating eclipses and writing articles on other astronomical phenomena. Mr. Isaac Paul in the June number of *Progress* says:—

During the year 1910 while Halley's comet engaged general attention, he (Mr. Allen Abraham) was particularly helpful in diffusing information in regard to this and other phenomena through popular lectures and articles in the papers.

Two points especially are to be noted to his credit in connection with his lectures on Halley's comet. He predicted and explained with diagrams that the comet would be visible to the naked eye in the middle of April, 1910, while other astronomers thought that it would not be seen so soon. In fact, the comet, which was first seen in photograph on September 11, 1909, by Dr. Wolf of Heidelberg, and in the telescope on September 19, 1909, by Prof. Burnham of Chicago, was first seen with the naked eye by Mr. Abraham on April 14, 1910. He communicated the news immediately to the Colombo Press pointing out where to look for it in the heavens.

Again he pointed out in his lectures, and explained with diagrams, that the comet would enter into the orbit of Venus, and reach so near it during the first week of May that its motion would be retarded by that planet. This proved to be a fact which was neglected even by some of the most eminent astronomers in their first calculation of the time of the comet's transit across the disc of the sun, and was noticed only just before the time of the transit after seeing that the comet had not advanced in its motion as rapidly as they first calculated.

PROGRESS OF CHEMISTRY IN INDIA DURING 1911.

The London Chemical Society issued sometime ago their annual Index and Progress Report of Chemistry throughout the world during the year 1911. Looking for Indian names we find very prominent mention of two distinguished chemists of Bengal—Dr. P. O. Roy of the Presidency College and Prof. P. Neogi of the Rajshahi College. It appears Dr. Roy with his pupils Messrs. J. N. Rakshit, R. L. Datta, H. K. Sen, and B. B. De have contributed between themselves ten papers and Prof. Neogi seven papers during the year. Of the seven papers, contributed by Prof. Neogi, three papers have been contributed jointly with Mr. B. B. Adhicari. This record of work is highly satisfactory, as the largest number of papers during the year was fifteen contributed by the celebrated German Chemist Prof. Emil Fisher and his pupils. Some of these papers are of great theoretical interest and the description of as many as twenty new compounds has been given in the papers, of which eleven have been discovered by Dr. Roy and his pupils and nine by Prof. Neogi.

Prof. E. R. Watson and his pupils of the Dacca College have also contributed two papers on dyeing.

In the Progress Report of the Chemical Society Prof. H. B. Baker, F. R. S. makes mention of one paper of Prof. Neogi and Mr. Adhicari on "the reaction between nitrogen and hydrogen and other substances in presence of nickel in various forms." Later on in the same report Prof. Baker refers to Dr. Roy's "long and painstaking researches on nitrites" In the *Analytical Chemistry* section the paper of Messrs. H. K. Sen and B. B. De has been noticed.

From the above it is evident that chemical research work has taken a firm hold in Bengal. The Tata Institute of Science is now an accomplished fact and it is to be hoped that in the near future Southern India will be another seat of scientific work.

PERSONAL.

THE MEMORIAL OF FLORENCE NIGHTINGALE.

Countess Feodora Gleichen, the daughter of the late Prince Victor Hohenlobe Lengenbarg, has been commissioned to model a memorial statue of Florence Nightingale. By permission of the King, the Countess still lives in St. James' Palace, and it was in her studio, overlooking the Park, in which Prince Victor used to work that a representative of the *Daily News* saw her. "The memorial of Florence Nightingale," said Countess Gleichen, "is to be placed in front of the Hospital at Derby, and will take the form of a semi-circle, with seats round, while the marble figure, some 6 ft 9 in. high will stand on a stone pedestal in the centre of the semi circle. Florence Nightingale will be depicted as the Lady of the Lamp." The design is said to be of classical simplicity and beauty.

LORD LOREBURN.

Lord Loreburn, better known as Sir Robert Reid who has resigned the office of Lord Chancellor, has been a very distinguished lawyer and Parliamentarian. He had been successively solicitor-general and attorney-general, and became Lord Chancellor in 1905. His successor, Lord Haldane, has been Secretary for War and in that capacity he reorganised the British army. When he was appointed as Secretary for War he said that 'not for any office in the State would he lay down the task he has in hand.' It is well known that he had a very arduous task in reorganising the army to bring it up to the highest level of efficiency. He has a profound knowledge of constitutional law, is one of the most scholarly men in Parliament, is an untiring worker, copious speaker and an apostle of 'clear thinking.' He has been characterised as the 'brain of the Empire.' By being made Lord High Chancellor, he will now draw a salary of £10,000 instead of £5,000, the salary attached to the office of the Secretary for War.

THE LATE DR ARTHUR RICHARDSON.

We deeply regret to hear of the death of Dr. Arthur Richardson, late honorary Principal of the Central Hindu College, which melancholy event took place at Benares. Dr. Richardson was one of the first band of European Theosophists, who under the inspirations of Mrs. Besant dedicated themselves with unselfish devotion and high-souled enthusiasm to the noble educational work as represented by the Central Hindu College of Benares. His high scientific attainments and capacity for original work built up a great reputation for himself, which spread to academic circles in the West. But more than his intellectual abilities, he had a saintly character, a noble soul and a sweet personality, which won the regard and veneration of all, who had the privilege to come in touch with him. His name will occupy a high place in the history of the great educational movement organized by the Theosophical Society and his memory will long be cherished by troops of his pupils and admirers.

MR ALFRED STEAD.

Mr. Alfred Stead, son of the late Mr. W. T. Stead, and author of "Japan by the Japanese" has succeeded, says the "Statesman's" correspondent to the editorship of the *Review of Reviews*. Mr. Stead, he says, is an able journalist, and has travelled much. His stay in the Far East, some years ago, has been productive of some very interesting writings on the future of Japan and China. We are told that he had a thorough journalistic training at the hands of his father, but he brings to it a natural ability which reveals itself in his work. He is thirty-five years of age, and has held the post of Consul General for Roumania since 1907. Under him the reputation of the *Review of Reviews* will suffer no eclipse.

POLITICAL.

A CEYLONESE IN THE COUNCIL.

The Hon. Mr. P. Arunachalam, of Colombo, has been presented with an address congratulating him on his appointment to the Executive Council of Ceylon. Being the first occasion on which a Ceylonese on his own merits has been raised to such an eminent position, the Ceylonese community offered Mr. Arunachalam their felicitations, and expressed their deep sense of appreciation of the work done by him for the country. The gathering was composed of Sinhalese, Burghers, Tamils and Mahomedans, thus testifying to the approbation by the classes of the action of the Ceylon Government in nominating Mr. Arunachalam to his high office.

AN EXPERIMENT IN CIVIL ADMINISTRATION.

The practice of attaching junior members of the Indian Civil Service to the Financial Department of the Government of India for training has proved a success, and already all major provinces, except Bombay and Madras, have had their turn. The Punjab Government is sending another junior officer this year, and Mr. R. D. Thompson, C. S., has been selected for duty.

PENSION IN POLICE SERVICE.

With regard to the recent questions in Parliament as to the reduction of the period of service qualifying for pension in the Indian Police to 25 years, it is understood that a despatch has been sent Home to the Secretary of State.

FAMINE PROJECTS IN AJMER AND MERWAR.

A survey is to be carried of the famine projects in the Ajmer and Marwar districts, during the current official year for which an expenditure of Rs. 4,000 has been sanctioned by the Government of India. The works are chiefly tanks and weirs of which there are a large number in the district.

INDIANS AND THE PUBLIC WORKS DEPARTMENT.

Mr. MacCallum Scott asked the Under Secretary of State for India how many applications were received for the post of Assistant Engineer in each of the past five years, and how many of these in each case were from natives of India.

Mr. Montagu: The total number of candidates for appointments in the Imperial Service were as follows: In 1907, 139; 1908, 292; 1909, 234; 1910, 234; 1911, 173. In 1907 the competition was confined to European candidates. The number of Indian candidates from 1908 to 1911 were: In 1908, 12, 1909, 10, 1910, 19; 1911, 21. Besides these there were at least one Eurasian candidate in 1908 and in 1909 and 2 in 1910 and in 1911. Some of the other candidates whose names are European may have been Eurasians or statutory natives of India, but no particulars are available on this point.

Mr. MacCallum Scott also asked the Under Secretary of State for India what was the total number of engineers in the Imperial Service of the Public Works Department and the State Railways, and how many of these were natives of India; and if he would state how many Assistant Engineers were appointed in each of the past five years, specifying in each case how many of them were natives of India.

Mr. Montagu: In reply to the first part of the question, the number is 736, including officers of the Royal Engineers. It is impossible, from the records in the India Office, to state the numbers of those who are statutory natives of India. As regards the second part of the question, the figures are as follows:—1907, total appointments 17, Indians 0; 1908, total appointments 39, Indians 0; 1909, total appointments 30, Indians 3; 1910, total appointments 30, Indians 3; 1911, total appointments 23, Indians 3. Indians were not eligible in 1907 but in and since 1909, 10 per cent, of the vacancies have been reserved for Indian candidates.

GENERAL.

LORD KITCHENER ON EGYPTIAN ILLITERACY.

"There is no doubt that illiteracy places the fellah at a serious personal disadvantage in his mutual relationships in life, and impedes at every step the economic and social development of the country," writes Lord Kitchener in his first Report on Egypt. "When the conditions of life were still simple, illiteracy was not perhaps felt as a serious drawback. Modern changes have, however, brought the agriculturist, trader, and workman increasingly into contact with the more highly educated sections of the community, thus making larger demands on their intelligence and capacity, and placing them amongst surroundings in which their illiteracy is an ever-growing disability. Valuable elements of national advancement can be obtained from even a little learning, in addition to disciplines which the character and the intellect undergo thereby."

LORD CREWE AND THE INDIAN PRESS

Lord Crewe, replying to a communication from the Institute of Journalists protesting against His Lordship's statement in the House of Lords on the 21st February, says:—

"The general expression given on behalf of the Institute to the sense of loyalty and responsibility of English newspapers in Calcutta, from which I am in no way disposed to withhold concurrence, makes it the more necessary to emphasise that no newspaper in British India can, on the ground of its general views and sympathies, regard itself as beyond the reach of the statutory limitations which it has been found necessary to impose for the regulation of the Press in India. There appears to exist a misapprehension regarding the scope and purposes of the Indian Press Act which are not confined to the suppression of sedition and treasonable conspiracy."

EAST AND THE WEST.

At the Karachi branch of the British Empire League, Karachi, a remarkable lecture was delivered on Friday on the subject 'East and West' by the Rev. Dr. Dhalla, high priest of the Parsis in Sind, the Punjab and Baluchistan. Dr. Dhalla entered upon a broad historical survey of the separate contributions of East and West to the common stock of human enlightenment. The lecture was a vindication of the East as an indispensable factor in the gradual process of the moral and mental development of mankind. It was also recognised that the East looks—and must long continue to look—to the West for almost all the elements of material progress and prosperity. At the conclusion of the lecture the Commissioner in Sind summed up the matter from the chair by emphasising the true lesson of Dr. Dhalla's lecture, namely, that the thing most to be sought after is a better understanding between the East and the West. All the audience, European and Indian, endorsed that sentiment and applauded it, and the Commissioner added that the *British Empire League* could attempt nothing worthier than the promotion of such an end.

EUROPEAN DEFENCE ASSOCIATION

The Calcutta correspondent of the *Pioneer* says that the European Defence Association of that city started in the days of the Albert Bill controversy but allowed to remain in a moribund condition is taking vigorous action to reform and revive itself. New blood has been introduced into the committee, and a new Secretary, a young and energetic English barrister has been installed. The committee include well known English solicitors and members of the Bar, but for the most part are leading European merchants and traders. A general meeting is being convened to pass revised rules and start what it is hoped will be a new life of usefulness and activity.

THE LATE MR A. O HUME.

THE INDIAN REVIEW.

A MONTHLY PERIODICAL DEVOTED TO THE DISCUSSION OF ALL TOPICS OF INTEREST,

PUBLISHED ABOUT THE THIRD WEEK OF EVERY MONTH.

EDITED BY MR. G. A. NATESAN

Vol. XIII.

AUGUST, 1912.

No 8.

Allan Octavius Hume

AN APPRECIATION BY

MR. DINSHAW EDULJI WACHA.

—:o:—

Oh! for the touch of a vanished hand,
And the sound of a voice that is still!

Remembered universally with expressions of undying gratitude and cherished with feelings of the warmest affection, Mr. Allan Octavius Hume has peacefully passed away amidst the tears and lamentations of millions of His Majesty's Indian subjects. In the annals of British India, few indeed are the instances recorded, where her people have mourned with such profound sorrow and sincerity the loss of an English commoner, of deep and abiding sympathy with their highest aspirations, of sterling virtues and the loftiest ideals, as that of Mr. Hume. The numerous appreciative obituary notices which have appeared in the columns of Indian organs of opinion of every shade and hue are unchallengeable evidence of the regard and esteem in which he was held and of the remarkably enduring pioneer work he did for the Indian people during the period of a quarter of a century and more after his retirement from the Civil Service of which he was no inconspicuous a member. A civilian of great farsightedness and indomitable courage, of unbounded faith and hope, he unmistakably gave proofs of those qualities during the darkest period of British rule in India when the very fate of the Empire, founded by the genius of the intrepid Clive, and the bravery and statesmanship of the dis-

tinguished soldiers and statesmen who came after him, trembled in the balance.

Myriads of eyes never saw Mr. Hume and myriads of ears never heard his strident but ringing voice, strong to command and stronger still to persuade and convince. Yet these very millions had read and heard of the unceasing and noble efforts he made, almost to his dying day, for their better social and political welfare with a singleness of aim and righteousness of purpose which impartial History will not fail to inscribe on its pages with the pen of iron in the fullness of time.

Mr. Hume was indeed a born leader of men. In him Indians instinctively recognised a commanding personality. To those who had come into close contact and intimacy with him it was manifest that he was an Agamemnon and Nestor rolled into one—such were his force of character, his sagacity and his determined will. They were the admiration of friends and foes alike. Signal instances of those qualities may still be plainly discerned in the trenchant criticisms he publicly hurled, during the earliest stages of the Congress movement, against those who, in the absence of the genuine weapons of offensive and defensive dialectics, had assailed it with the poor missiles of raillery and ridicule, of calumny and abuse. The criticisms were hurled with all the force of the avalanche against that most formidable enemy of the Congress organisation, no other than the benighted Anglo-Indian bureaucracy of which the late Sir Auckland Colvin was the most valiant protagonist. It is superfluous at this time of the day to recall the mortal combat of words which ensued between Mr.

Hume and that adversary. Sir Auckland denounced the movement and its founder because he thought it was premature. Mr. Hume rigorously rejoined and inquired *when* it was to commence. Whether the day would ever come when it was to make a start? Both were keen controversialists. Both were beaux-sabreurs of civilian intellectualism. But none, at this time of the day, after a careful perusal of the "Hume-Colvin correspondence," would deny that the popular protagonist had the honours of the arguments. "*Audi Alteram Partem*" is the facile principle of all the many controversial public writings of Mr. Hume. The rising generation of Indians have every need to read, mark and inwardly digest the contents of that correspondence, if for naught else, to learn therefrom how a national cause could be fought by the exercise of the highest dialectics, supported by irrefragable facts.

It should not, however, be supposed that Mr. Hume was alive only to the greater progress of the educated classes leading to political welfare. No doubt the time was ripe to set a legitimate agitation on foot for their better political evolution, for their emancipation from the leading strings of the "paternal Government" imbued with the spirit of benelolent despotism. The bitter controversies in connection with the harmless but ill-fated Ilbert Bill had paved the way for the institution of the Congress. It is no exaggeration to say, as any unbiased student of British Indian politics may find out for himself, that the Congress was the direct, inevitable and logical sequence of the events and episodes which marked the stormy course of that Bill, outside the Council hall of the Viceroyal Legislative Council, before it passed into law. "The dry bones in the valley," to use Sir Auckland Colvin's own words, had been slowly "galvanised into life." Life came at the heel of the Ilbert Bill. The educated life of India rose like one man to struggle for its emancipation from the bondage of the bureaucracy.

If Mr. Hume founded the Congress, he was no less alive to the necessity of uplifting the masses, the agriculturists who make up seventy

per cent. of the population, and ameliorate their unhappy condition. Long, long before the date of the institution of the Congress, had he, while still in the service, advocated the cause of that indigent and indebted peasantry. It was Lord Mayo who was the first Viceroy to establish an agricultural department, firmly convinced as he had been by his personal experience of the economic condition of the ryot. Unfortunately, after his death, the department was greatly neglected and eventually abolished. It was this very abolition which prompted Mr. Hume to publish in 1879 his most valuable, but, alas, now neglected, brochure on "Agricultural Reform in India." It was published by Messrs W. H. Allen & Co. of 19 Waterloo Place, in London. Why that Agricultural Department, when in existence, had never been able to effect much in the way of agricultural improvement, is fully explained in that admirable pamphlet, written with that verve and nerve, and close reasoning which are the main characteristics of all Mr. Hume's most serious writings. He observed that the Department "knew what was required, and from time to time, when allowed a chance, did a little good on its own motion. So long as it existed, there was always a hope that, amid the vicissitudes to which public affairs are subject, some lucky turn of the wheel might bring enlightened ideas on these subjects into vogue, and thus render possible its conversion into a real working Agricultural Bureau. All this has passed away, and the only hope for India now lies in the chance that the real bearings and vital importance of the questions herein discussed may be better understood and appreciated in England than they ever have been, since Lord Mayo's death, by those in India." This long extract has been quoted here to point out the genuine interest Mr. Hume had at heart to ameliorate the condition of the Indian peasantry. He was for a time engaged in the Agricultural Department and knew what he could and could not do. So that the pamphlet was written from his own inward knowledge and experience of the real agricultural

situation. It needs to be read with the greatest care and attention to discover how Mr. Hume was profoundly concerned with the deplorable condition of agriculture in the country and how he felt for the impecunious ryots. It is a monograph which will endure when even every other public writing of Mr. Hume is forgotten. Mr. Hume was a witness to the horrors of the severe famine of 1877—78 and fully familiar with the hardships and distress, the wants and woes of the peasantry. In that well known other brochure, called "The Old Man's Hope," he again most feelingly referred to the miserable condition of the ryots. The following was his piteous appeal to Englishmen at home:—"Ah men, well-fed and happy! Do you all realise the dull misery of those countless myriads? From their births to their deaths, how many rays of sunshine, think you, chequer their gloomshrowded paths? Toil, toil, toil; hunger, hunger, hunger; sickness, suffering, sorrow; these, alas! are the keynotes of their short and sad existence." It will be thus perceived that Mr. Hume's activities were not all in the direction of the political welfare of the people. Some of the resolutions of the earlier Indian Congress on agriculture and poverty, bear the impress of his old Roman hand. Indeed, as a matter of fact, never did he bate one jot in his keen sympathy for the amelioration of the condition of agriculturists. It is some solace to be able to say that the Agricultural Department, which was unwisely abolished in 1879, was reorganised and reconstructed on a solid and permanent footing during the Viceroyalty of Lord Curzon. Whatever may be the many sins of that strenuous Viceroy none can gainsay the fact that he had earned the gratitude of the Indian masses so far. It was he who laid the foundation of the new agricultural department which is now putting forth its best efforts in a variety of directions for the improvement of agriculture and agriculturists. What has been accomplished during the last ten years is an earnest of what may be expected in the future. There is no burning problem in India these last fifty years of greater vital importance than the agricultural problem, with the

chronic poverty and indebtedness of the agricultural masses. That poverty is the real skeleton in the cupboard of the Government of India. May it be the good fortune of Lord Hardinge to take that skeleton down from its cupboard before he lays down his exalted office!

So much has the Indian bureaucracy remained obsessed with Mr. Hume's activity with the Congress movement, on its political side, that it is not surprising it has given the complete go-bye to his equally keen sympathy for the Indians in the matter of social reform. Indeed, it is well known that the original idea of a national conference had for its principal object social amelioration, convinced as he was that that was also an equal necessity. But for Lord Dufferin's own suggestion, when Mr. Hume submitted to him his scheme of a Social Conference viz., that the inner sentiments and minds of the people on the many difficult problems of Indian Administration should be given preference, it is not inconceivable that the principal plank in the platform of the Congress might have been Social Reform. People have, again, forgotten, that at least at the first few Congresses, problems of social reform were discussed in right earnest, at the conclusion of the political proceedings. At the very first Congress held in Bombay, under the presidency of the ever to be remembered Mr. W. C. Bonnerji, the late Dewan Bahadur Raghunath Rao, a staunch social reformer and the late Messrs. Ranade and Telang, discussed large social questions. Experience, however, was soon gained and it was, therefore, resolved that social reform questions could be infinitely better discussed, with every chance of early realisation, with a separate organisation. Thus it came to pass that what was an adjunct of the early Congresses became later on an independent organisation but still in touch and sympathy with the Congress itself. It should also be remembered that all leaders of thought in those early days deemed it wise that reforms, be they political or social, should proceed on the lines of least resistance. It was recognised, firstly, that politics to a large extent smoothed the way for social reform, and, secondly, that politics proceeded more

easily on the lines of least resistance than social questions.

Apart from this fact, let it be known how keenly and with what sagacity Mr. Hume thought of the necessity of social reform and of the Indian community putting its social house in order. As far as Mr. Hume's keen solicitude for social reform went, the following extracts from his valedictory address will suffice. He told his Indian friends that they would not be free in the sense that the brave Britons are free until they proscribe many a social custom and usage which are the source of the greatest evils and hindrances to people wishing to be great and self-helping. Not only had they to cultivate their intellect, but they must cultivate their morals, their ethics. The evil custom of early marriage, the sad condition of virgin widows, to be computed by the thousands, these must be first removed. Reforms proceed from within and if Indians wanted to be free they must reform their domestic usages and customs, without any extraneous stimulus. He descanted on the degeneracy attending early marriages. "Here lies," he said in his own trenchant words, "the first foundation stone of that national greatness which we fondly hope will hereafter clothe, as with a robe of glory, old India and her regenerated sons. Assuredly, there is no greater, grander or more glorious work before you than the reinstatement of India's women on the exalted pedestal which is their due and which your wise forefathers, thousands of years ago, when India was great and glorious, accorded to them."

Having said so much about Mr. Hume's views on social reforms and about his warm solicitude for the impoverished and luckless agriculturists, it may be as well to hark back to his *magnum opus*, the Indian National Congress, his most useful as well as his most glorious handiwork—that noble edifice the foundation of which he firmly laid and the coping stone of the arch of which he lived, by Divine grace, to see. At a great public meeting called at Allahabad, on 30th April 1885, Mr. Hume delivered a most elaborate and comprehensive address explaining the origin, aims and objects of the nation-

al organisation. "No movement," he said, "in modern, I may say, in historical, times has ever acquired, in so short a period, such an appreciable hold on the minds of India; none has ever, in my humble judgment, promised such wide-reaching and beneficent results; and yet, with that strange perversity which pervades all mundane affairs, none has been ever more persistently, ludicrously misunderstood and misrepresented." What is the origin of the Congress, he inquired. "The Congress movement is the only one outcome, though at the moment the most prominent and tangible, of the labours of a body of cultured men, mostly born natives of India, who some years ago banded themselves together to labour silently for the good of India." Those far-sighted and cultured pioneers of political reform, the real advance guard of the Congress, had laid down some fundamental principles on which the country's work of regeneration was to be carried out. What were those principles? Mr. Hume lucidly expounded them. They were three-fold: "First, the fusion into one national whole of all the different, and till recently, discordant elements that constitute the population of India." "Second, the gradual regeneration along all lines, mental, moral, social, and political, of the nation thus evolved." And "Third, the consolidation of union between England and India by securing the modification of such of its conditions as may be unjust or injurious to the latter country." Those were the basic principles on which the Congress was founded, and those are the principles on which as firm as a rock it stands to-day after all the vicissitudes of the past twenty-six years of its active existence. Those principles, indeed, have been even more crystallised to-day by the written constitution of the Congress adopted at Allahabad three years ago of which the very first clause is the Creed. The Creed of the Congress crystallises and emphasises the earlier basic principles. It very fairly and fully expanded the Congress scheme. Mr. Hume said in the concluding part of that memorable speech, which deserves to have a place in the home of every unit of the vast population of the peninsula, and, aye, even in

the library of every Secretariat in the Empire, that he claimed to have shown "that alike in the basal principles of its original promoters, in the special objects which they designed, and in the measures that the Congress has recommended, there is much, very much, to commend the movement to all good and wise men and nothing, absolutely nothing, to repel the sympathy or prevent the heartiest co-operation of any such in our beneficent work." These are brave and noble words of a true Englishman, burning with a desire to see India united as a nation for the purpose of regenerating herself morally, socially and politically, under the all-spreadng ægis of the great British people.

That the Congress had fully accomplished its first spade work was well testified when Mr. Bradlaugh introduced into Parliament his own Bill, based on the lines enunciated at the historic gathering of 1889 at which he was present and at which that indefatigable coadjutor of Mr. Hume, no other than Sir William Wedderburn, presided, for the reform of the Legislative Councils under the Act of 1859 which had become a mockery and a by-word of reproach to the Indian administration. Unfortunately for India that stalwart and sympathetic Radical did not survive to see to the passing of the Bill in a modified form as finally introduced by Lord Cross. But the reformed Councils of 1892 were unquestionably the direct and most substantial outcome of the labours of the pioneers of the Congress. The institution of that reform was a great encouragement and inspiration giving full hope that the future work of the Congress would prove to be even more useful and enduring. And happily for Mr. Hume he lived to see that further realisation of his noble efforts, namely, the more extended reform of the Councils which are destined to have a far-reaching influence on the fortunes of this great country with its heritage of the richest and most glorious traditions.

It only remains to allude to one more fact in appreciation of Allan Hume. On the eve of his final departure from India in 1894, the Bombay Presidency Association presented him with a farewell address in which it fully and fairly expressed the universal feeling of great

affection in which he was held as the Father and Founder of the Congress. "It is a pleasure to us to acknowledge that you are one of those high-souled Englishmen who have evinced genuine and earnest sympathy for our people, and have striven hard to help us in reforming ourselves and remedying our evils. Your appearance at the helm of our political movements marked a new era in their history, first gave them a new life and a new impetus. To your capacity for arduous work you added fertility of resource and skilful powers of organization. Your inspiring example reared around you a unique band of workers prompted by the same zeal and devotion."

That zeal and devotion, it is a matter of gratification to say, continue unabated. To all the brave but patient and persevering band of workers in the Congress cause it is a satisfaction to know that Mr. Hume's inspiring and inspiring words have been greatly instrumental in making the Congress respected and heard in the Councils of Government as it was never heard before.

Mr. Hume has gone but with the conscious satisfaction of the unchallengeable fact that the seed he sowed has ripened and is bearing fruit. He lived to see the tree growing in all its richness, throwing its branches far and wide in a manner undreamt of. For, looking around us, what do we find at the present day? There are Conferences, Leagues, Samajes, and Associations of all kinds, each striving to do its best in its own special line, be it social reform, or industrial regeneration, be it educational or religious, be it moral or material or any other. Thus another outcome of the Congress is that it has become the parent of so many other progressive and useful institutions all of which have for their fundamental aim and object the greater advancements of the people as a whole towards final unity as a nation. Thus, the Congress is the Mother of all the Conferences and Leagues, as that noble and historical institution at Westminster, which has survived six centuries and more is known as the Mother of all Parliaments in the world. Although the word "National" is derided and derided, there is not the slightest doubt that in the fullness of time it will have

justified itself and vindicated the prophecy of the founder of the Congress. Never was there a seer who had seen his own prophecy fulfilled to so large an extent as Mr. Hume had during his own life-time.

There are visions and visions. But the vision which Allan Hume one day dreamt and prophesied is indeed one of those historic visions which has to be permanently recorded in the pages of British Indian history. With a clear gaze and the true insight of a great seer did he dream of that blessed day when India will be really united. It seemed as if Mr. Hume had borne in mind the lines of the poet who has said :

Our visions have not come to nought
Who saw by lightning in the night,
The deeds we dreamed are being wrought
By those who work in clearer light.

Mr. Hume has passed away, but his name is inscribed in the heart of every Indian with pride and affection. Never more shall we see his like again. In times gone by there have not been found wanting a few Englishmen, who have shewn their sterling sympathy for India in and out of the British House of Commons. Who can forget the names of Burke and Fox, and their burning and inspiring words, their eloquent appeals for Liberty and Justice? Who can forget that great orator who, deriving all his inspired eloquence from the Holy Writ, was never unmindful of India but embraced every important occasion to tell his countrymen in the House of Commons that by Righteousness alone can the people of India be governed, aye, that Righteousness alone exalteth a nation. But John Bright is gone. And so is Professor Fawcett, who by his sterling independence and closest study of the Indian administration from a lofty standpoint, brought down the self-sufficient bureaucracy to recognise the fact that its many acts could be impartially reviewed and criticised without ever stirring out from Westminster Palace. The last of that noble band of stalwart sympathisers was Bradlaugh. He, too, has long since gone to his resting place, but not without leaving an indelible impression of his solicitude for India on the Indian mind. None, however,

can approach Mr. Hume. His was a unique advocacy inspired by the noblest and most righteous thoughts. He alone knew how to charm, how to strengthen and how to teach. He is gone, but not without teaching us that though we have no wings to soar, we have feet to scale and climb, more and more by slow degrees the cloudy summits of our times. Meanwhile India is conscious of and takes comfort in the fact that there lives yet another Englishman, of equal solicitude and sympathy, equally unselfish and equally lofty in thought and deed, to inspire all. United India sends forth her fervent prayers that Providence may long keep watch and ward over Sir William Wedderburn and spare him many a year to witness the complete fruition of the great Congress tree which in company with Allan Hume he was most instrumental in planting. Well may he say with Matthew Arnold:—

See on the cumbrous plain,

Clearing a stage,

Scattering the past about,

Comes the New Age.

Birds make new poems,

Thinkers new schools,

Statesmen new systems,

Critics new rules.

ALLAN O. HUME.

(THE FATHER OF THE CONGRESS MOVEMENT)

A sketch of his life and his services to India, with copious extracts from his speeches and writings and his messages to the Congress. With a frontispiece.

Messrs G A Natesan and Co., Madras, have added to their "Friends of India" series an interesting sketch of the late Mr. A. O. Hume's life and services to India. The pamphlet gives an admirable account of Mr. Hume's activities in the cause of Indians' political and social advancement. *Madras Mail.*

The small brochure on the life sketch of the late Mr. Hume, of the Friends of India Series, which we have received, is a timely publication and is sure to interest the reading public. It is priced so low as 4 As that it may be found in the hands of all—*Indian Patriot.*

The sketch is brightly written and its usefulness is enhanced by the extracts from Mr. Hume's writings and speeches that are appended to it. The pamphlet is priced at four Annas only—*Leader.*

As 4 each, 6 (Six) at a time As 3 each.

G A Natesan & Co., Sankararam Chetty Street, Madras.

India's Lost Right.

A Plea for its Restoration.

BY THE HON. M. DE P. WEBB, C.I.E.

HERE are many standards by which the material progress of a nation may be gauged. One of the most significant, and at the same time most obvious, is its monetary system—the nature and composition of the monetary instruments in daily use, and the principles which guide the governing authority in the issue, control, and development of those monetary instruments.

How does India stand, judged by this standard—India, the strongest, wealthiest, and most populous division of the Empire? With a foreign trade equal, but a few years ago, to that of all the Self-governing Colonies combined, and still only second in importance to that of the United Kingdom itself, it might well be assumed that India possessed the best and most highly developed monetary machinery that the accumulated wisdom of mankind had so far been able to evolve. Yet what are the facts? India finds itself to-day handicapped with an embryonic, second-rate monetary system, state-managed after the style of a century ago and, as a result of its defects, a perennial source of a certain anxiety and distrust to Government and the public alike.

Some may consider this statement to be expressed in the language of intemperance and exaggeration. Let us therefore test our adjectives by references to historical realities. Why can India's monetary system only be called 'second-rate'? The answer is plain. It is based mainly on silver, and for monetary purposes, silver is only second rate when compared with gold. Copper money is better than shells. Silver is better than copper. And gold is better than silver. Everybody is agreed on these matters. Further, every civilised nation in the world has now recognised that a monetary system based on one metal is the best arrangement that can be attained up to the present. England was the first to come to this conclusion just upon a century

ago. Since then every nation in Europe and America (except poor Mexico) and the greatest nation in Asia—Japan,—to make no mention of the whole of the Self-governing Colonies, have all followed England's example, and legalised as their monetary standards the best metal obtainable, namely gold. By so doing they have overcome for ever the hindering break of gauge between silver and gold. The establishment of gold currencies, gold purchasing instruments, gold standards of value, and gold measures of deferred payments has raised them all to the first rank economically and politically, as far as a first rate monetary equipment can do, and they command a corresponding respect in the political and financial centres of the world.

Why should rich, powerful India lag behind? India is now the only important division of the Empire that is still attempting to lump forward mainly by the aid of silver. Some say that the peoples of India are too poor to be able to use gold money. Such statements are grossly misleading. One quarter of the people of the United Kingdom are always living on the verge of starvation, and rarely see a gold coin. Yet gold is everywhere current in England. So, too, in India. There may be scores, possibly a hundred or two hundred millions, who would not be able to make much use of gold money for a considerable time to come. Still, there are many millions who could, and would. Probably there are more individuals in India who would handle gold money than in Great Britain itself. Why, then, hesitate? Let us have Indian gold money in circulation and see. Certain it is that as long as we cling to bulky, cumbersome silver coins, so long shall we be regarded by the world at large as second-rate in our currency habits, second-rate with our monetary system, second-rate in our financial ideals and ambitions.

To make matters worse, our present second-rate system is, as a matter of fact, only in an embryonic stage,—that is to say, it is but partially developed,—dependent upon the mother nation for its vitality,—unfit to rank with other perfected self-acting monetary mechanisms such

as we see in every modern civilised country. Why? Wherein is our imperfection? Again the answer is obvious. We lack an open mint. A monetary system without an open mint is not a 'system' at all. It is merely the rudiments of a system—beginnings that may eventually result in a perfect monetary mechanism, but which, in the meantime, can only be regarded as transient and unsatisfactory. An open mint, freely accessible to the public is the one central, essential feature without which neither the quantity of metallic money in circulation nor the general level of prices can be automatically adjusted in accordance with the pressure of surrounding conditions. There being much misunderstanding regarding the true functions of the modern open mint, it may perhaps be advisable to explain the theory underlying this most important state mechanism.*

The general level of prices is admittedly related—though the relation is now-a-days greatly obscured by the magnitude of the credit resting on a small metallic basis—to the quantity of money in actual circulation. If, for example, large quantities of unmanufactured money, i.e., gold, are suddenly discovered in any given locality, then money in that locality is relatively cheap—in other words, prices there are relatively high. This high level of prices attracts commodities from other parts of the world, with the result that goods flow in, and gold flows out, of the gold-producing district. As the precious metal flows into the country supplying the commodities (say England, where, there being an open mint, gold can be easily tested, assayed, and coined into sovereigns), it tends to raise, by its relative abundance, the general level of prices in England. What is the result? Relatively high prices in England attract goods from other countries for sale in England, and England is compelled to ship some of its newly acquired gold abroad, where, with open mints, it can, if required, be at once converted into the legal tender money of the importing country. And so on. Here, very badly and sim-

ply stated, we have the theory of international trade, and the ultimate reason underlying the shipment of money from one country to another. Goods are shipped from countries where prices are relatively low to other countries where prices are relatively high whilst metallic money flows from the lands of high prices to those of cheap goods. As the metallic money runs into its new reservoirs, it tends to raise price levels in the money-receiving localities, and so prepares the way for a further subsequent adjustment of price levels and of metallic monetary levels. And this adjustment and readjustment goes on, year in and year out, all over the world—not, be it carefully noted, at the instigation or by the direct assistance of the Governments of any of the countries concerned, but in response to the activities and requirements of the trading public. Government's sole function in these matters is simply to provide the necessary monetary mechanism—the State mint, where the precious metal in use as the chief monetary standard can be received, refined, and manufactured into money just when and as the public may demand.

Without an open mint, the manufacture of money depends upon the judgment or idiosyncrasy of some individual holding office under Government. And with the result that, instead of being automatic, in response to the general demands of the public, the manufacture or non-manufacture of money is liable to be inspired by the private requirements of a few big money dealers. Thus, the current rates of interest and general level of prices may be influenced by withholding money when it is badly wanted, or issuing it in excessive amounts when there is no real widespread demand for it. The defects and abuses inseparable from State management have been so widely recognised, that closed State-managed mints have been everywhere abandoned long ago. Persia and China are now the only prominent relics of bygone times in these matters. India is by no means anxious to emulate Persia or China in their pathetic conditions of monetary chaos.

If, now, we turn our thoughts to India's past monetary history, we can recall the fact

* The paragraph that follows is extracted from my *Britain's Dilemma*.

that India is by no means so backward as some people might imagine. Gold money has been known in India for fourteen if not fifteen centuries. Historians will remember the *varaha* (meaning the boar of Vishnu) which used to be stamped on the gold coins of Southern India from the period of the Chalukya dynasty. From the sixteenth century, or earlier, the Portuguese called the little gold coin *pardao de ouro*. Coming to more recent times, the star-pagoda of Madras (worth about 7s. 6d.), and also the Pondicherry and Porto-Novo *pagodas* were very popular coins a hundred years ago. These *pagodas* were used in Ceylon, Mauritius, the Cape of Good Hope and St. Helena. In 1800 an Indian *pagoda* was declared legal tender in New South Wales. In 1806, when the reform of Indian currency system and the introduction of a uniform silver rupee was under consideration, the directors of the East India Company decided not to interfere in Madras..... 'where gold is the principal money in circulation and the money of account.' In 1818, however, the coinage of *pagodas* was stopped and the issue of a gold rupee or *mohur* (worth Rs. 16) was ordered. Thus ended the gold *pagoda*.

Gold *mohurs* of about 300 grains were first coined in the fourteenth century. There is very little evidence that *mohurs* were widely used. After 1758 the East India Company endeavoured to make gold the monetary standard of India but without much success. In 1766 the gold *mohur* was declared legal tender as the equivalent of 14 sicca-rupees. In 1774 it was ordained that a gold *mohur* should be struck of the same weight as the silver rupee. Ordinance XLV of Bengal in 1803 expressly declared the gold *mohur* to be the money of trade. And so on, up to 1852, when the Government of India, fearing that the large discoveries of gold in Australia and California would lead to a marked depreciation in the value of gold, suddenly authorised the issue of a Notification demonetising gold, and stating that no gold coins would thereafter be received at the Public Treasuries. Thus ended the gold *mohur*.

It is necessary to recall these facts about India's old gold money, because so widespread

is the ignorance of these matters that we found only a short time ago the celebrated London bullion dealers Samuel Montagu and Co., solemnly informing the world at large in one of their weekly Trade Circulars that..... 'it must be remembered that silver rupees have been from ancient times the only coins familiar to the varied and populous nations of India'....

The banishment of gold money in India by the East India Company and the Government of India was a sad blunder. It was a retrograde step, too, because, as we have seen, every civilised nation in the world has recognised that gold coins and a gold monetary standard are a step in advance of silver coins and a silver standard. The mistake was made in good faith, however, and in the belief,—a belief shared by many of the most learned economists of the day—that gold would depreciate so much owing to the great American and Australian discoveries of the 'fifties' as to be a serious menace in any country's monetary system. A striking testimony to the fallibility of human judgment is the fact that within 30 years of the demonetisation of gold in India, the Government of India once more became apprehensive about their money. This time it was the future of silver that troubled them. In 1893 after much anxious discussion Government at length decided to demonetise silver and return to gold!! There were many opponents to the step at the time; but the phenomenal quantities of gold since made available for the use of mankind, have confirmed the wisdom of the decision arrived at in 1893, and nobody any longer questions the soundness of the policy then initiated.

Unfortunately the step forward taken in 1893 was marred by the withdrawal of a right which the peoples of India had enjoyed uninterruptedly for several generations—the right to have their precious metal assayed, weighed, cut and stamped in the form of legal tender money as they required, on demand. This automatic State machinery which, as explained above, is an essential feature of every modern currency system, enabled the people in times of stress to turn their reserves of metal into purchasing instruments of

irresistible power. Indeed, in famine time, the villagers frequently parted with their silver ornaments which were always—till 1893—worth their weight in rupees. With the closing of the Mints in 1893 to the free coinage of silver this safeguard disappeared. The people suddenly found themselves deprived of substantial portions of their reserves owing to the rupee being artificially raised above the gold value of its weight as silver; whilst the public had no means of freely obtaining large supplies of legal tender money except at the pleasure of the Secretary of State for India who sold his rupees when and as he pleased. The Indian Mints ought, of course, to have been opened to the public for the free coinage of gold simultaneously with their closure to the free coinage of silver so that the principle of an automatic mint—the machinery by which price levels and rates of interest readily adjust themselves to public demands—remained undisturbed. Instead of which, by abolishing India's open mints and substituting a State managed monetary supply Office, Government reverted to the currency methods of a century ago,—methods which every civilised nation has long ago abolished as being objectionable, and which the Government of India themselves condemned in 1876 in a Despatch to the India Office on the subject of Indian Currency.

With the arrival in India in 1899 of a practical business man of financial experience as Finance Minister—the late Sir Clifton Dawkins—an effort was made to put matters right. Not only was the English sovereign made legal tender at the equivalent of fifteen rupees, but the recommendation of the Indian Currency Committee of 1898 that India's Mints should be opened forthwith to the free coinage of gold, was accepted and arrangements made to open the Bombay Mint for the reception of the precious metal from Mysore. Alas, difficulties and objections were raised in London, with the result that the long overdue restoration of India's lost right—the possession of an open mint—was once more deferred. And now here we are, thirteen years later, still without our open mint, and

still at the mercy of outside money mongers who so influence the Government Money Supply Office at Whitehall that our spare cash is transferred to London and lent out there at 2½ per cent whilst the peoples of India are at times forced to part with their goods at low prices because they can no longer afford to pay the 6 or 7 per cent. (or more) which in the cold weather represent under present currency conditions the current rates of interest in India!

Enough has now been written to afford every Indian patriot a clue to the nature of the indignity and loss which India endures owing to her being deprived of a right that she formerly possessed, and which every modern nation enjoys. Australia with its numerically puny population and relatively small trade has a gold currency and three open Mints. Canada with only a slightly larger population and trade, also possesses a gold currency and an open Mint. England, which only produces about 42,000 or 43,000 worth of gold a year, has one of the largest and busiest open Mints in the world. India with its annual gold production of 42 3,000,000 and with a foreign trade far larger and more important than that of Canada or Australia undoubtedly merits the restoration of that of which she ought never to have been deprived—her open mint.

What kind of gold coins are now best suited to the requirements of modern, civilised India must be left for the peoples of India themselves to decide. Sir Vitthaladas Thackersey advocates the minting of a new Rs. 10 gold coin as being of a suitable value for the people. Moreover a unit of Rs. 10 would be simple for purposes of calculation. I fully concur with this. And if Sir Vitthaladas will permit me to add to his proposal, I would suggest that the historic and world-famed name of India's most popular gold coin of a hundred years ago be revived, and the new Rs. 10 gold pieces be named *pagodas*.

As the English sovereign is already known and legalised as money in India, I put forward for consideration that a coin of exactly the same weight and fineness should also be coined at the Indian Mints—to be called the Indian

Sovereign or Mohur. It could bear the King-Emperor's head exactly the same as on the English sovereign on one side; and a shield or other design similar to the old gold mohur on the other side. These Indian sovereigns could and probably would, be exported from time to time, and their appearance would carry the name and fame of India wherever they went.

I notice that in response to a recent enquiry, the Madras Chamber of Commerce proclaimed to the world that its members were not in favour of gold money for India. It is difficult to understand why an experienced body of English merchants should desire to keep India a hundred years behind the times in the matter of its monetary system. Fortunately, Indians themselves are showing greater knowledge and foresight. The report of the Accountant-General and Commissioner of Paper Currency for the Punjab shows that in northern India, all classes of the population from the villagers upwards, are eagerly demanding and daily using sovereigns in their current business transactions. Many millions sterling in gold coins are already in circulation, and the demand for these convenient and beautiful coins is daily increasing. Here we see the people of India acting exactly as the peoples of the West have already acted in these matters. All that is now needed is that India's lost right should be restored, and her mints opened to the free coinage of gold. This accomplished, India will stand on an equality with Australia, with Canada and with England itself, so far as her monetary arrangements are concerned.

BRITAIN'S DILEMMA—By Hon. Mr. M. De P. Webb, C.I.E. An explanation of one of the causes of many of our present difficulties—A Plea for the restoration of India's Lost Right. MR. MALABARI AS I KNEW HIM.

BY MR. A. YUSUF ALI, I. C. S.

THE Editor of the *Indian Review*, has asked me to write a brief appreciation of Mr. Malabari as I knew him. I do so with melancholy pleasure, because Mr. Malabari's life is full of inspiration for young and aspiring India.

Among the Greeks and Romans of antiquity the practice of delivering funeral orations on great men who had passed away afforded an opportunity to their personal friends of dwelling upon some side of their intimate character which did not figure prominently before the public gaze in the stress and battle of life. The opportunity was nobly utilised on many occasions by famous orators, who worthily used all the graces of language and all the solemnity of the occasion to turn their hearers' thoughts to virtues which adorn life and take away the sting from death. This practice is still honoured in Latin countries but has taken no root in Anglo-Saxon civilisation, from which Modern India takes its cue.

The cold, lifeless page of a journal is no substitute for the living voice of a friend speaking to living persons in tones of earnestness and tenderness about the eternal virtues which are never old and never new, but which come to each generation as a special gift from the example of noble lives. And, yet, even the cold printed page may afford the vehicle for a reverent tribute to a life like Malabari's which was full of peace, and which, after a course of 59 years, ended in peace and free from pain.

Peace of the soul! That sums up the very quintessence of Malabari's life and character. No one could ever ruffle his temper. No circumstances ever daunted him or made him lose heart. In his day he fought many public questions, but he never stirred up bad blood or lost his self possession. His singularly lovable character appeared to advantage in his personal relations with men of all shades of opinion. He was an idealist,—no man more so; but there was no impatience in his idealism, and he never lost faith in the power of truth in the end.

I remember the Age of Consent controversy, which we may practically say he initiated. But there was no shouting or wrangling, and no calling of hard names—on his side. He fought calmly, sure of his ground. He spoke with conviction because he stuck to the core of the matter.

The next glimpse I had of him was in London in my student days, somewhere about 1892 or 1893. He had just published his book: *An Indian Eye on English Life*. More than any other book of his, it shows the pre-dominant traits of his character—his keen observation, his detachment from the comedy of life where it broadens out into farce, and his catholic sympathy and friendliness. Even the London cabby loved him and the London cabby of those days was a "Bahadur" compared to his pathetic survival in these days of motor taxi-cabs.

When he started his magazine *East and West* in place of the old *Indian Spectator* he introduced an element into Indian journalism which was altogether different from anything which had existed in the country before. Like his personality, his paper reflected sane views

in an atmosphere of severe detachment. He was the sage in Indian politics, and yet out of politics. His attitude may be compared to that of a Sanyasi who lives in a picturesque cave far from the madding crowd, and yet interested—keenly interested—in everything that goes on and in every one who has an idea.

He spent several hot weathers in Simla for the benefit of his health, but in the midst of the summer capital of India he created a characteristic atmosphere round himself. He shunned no one, and he courted no one. A few devoted friends were always with him, cherishing his personality as a precious gift and learning to temper with his gentleness all the fiery dreams of youth which the crisp air of the Himalayas at once stimulates and purifies. Any afternoon you could meet Malabari walking in Simla,—or the Mall, round Summer Hall, round Jacks, or even on the roads leading up to Jacks. And even his walk was no more perfunctory than his talk. He thoroughly enjoyed his walks and his climbs, and asked for nothing better than the society of his chosen friends to make him happy in the flow of his conversation. No wonder that one such friend—an author and sage himself though much younger than Malabari—remarked on Malabari's death: "I feel like an orphan now."

The larger questions always interested him. Though a Parsi, he made his chief impression in the cause of Hindu social reform. Perhaps it was best so. There may be some who may consider this a disadvantage, but it exactly fitted in with his detached habits of thought. If fruitful ideas are to be worked out and applied in India, the impulse will come best from those who, like the spectators at chess, see "the best of the game" from outside.

And now this personality has passed from the scene. We younger men can but dwell on it and treasure its memories. We can hand them down to those who will soon take our place. But in our own lives we can all say that 'it is good to speak of such a man. Fortunate indeed are those who held personal communion with him. Gentle soul! perchance he will yet speak to them and guide them with a more potent, if less tangible, spiritual force.

THE PUBLIC SERVICE COMMISSION.

BY

DEWAN BAHADUR C. KARUNAKARA MENON,

(Editor, "Indian Patriot.")

THE Public Service Commission has been constituted. There are twelve members on it including the President. Divided according to communities there are two Hindus, one Mahomedan, one Anglo-Indian, and eight Britishers. The Civil Service is represented by two members. Other services are altogether unrepresented. The composition of the Commission has been criticised as inadequately representative of the Civil Service by one school, of Indian opinion by another. It is contrasted with the composition of the last Public Service Commission to show how far defective it is comparatively, and there is surely ground for dissatisfaction. Dividing the Commission broadly according to the politics of its members, it is evident that Liberal opinion on it is overbalanced by Conservative opinion. Nevertheless I am inclined to think that the Commission, as it is, is well fitted for the responsible work it is called upon to do. There is, indeed, Lord Ronaldsday whom many people regard as an extremist of one type. But as against him there is Mr. Ramsay MacDonald whom other people regard as an extremist of the opposite type. Setting aside these two, there are Sir Valentine Chirol and Sir Theodore Morison. In both, in my view, there are good points. Sir Valentine is by no means a narrow minded politician, though he is a Conservative. Though he may be opposed to us in many things, he will be with us in some important respects. So far as he is with us, his support will be very valuable. Sir Theodore Morison, to judge him from the books he has written, has a sympathetic insight into the problems of Indian politics. He is not

a bigot in any sense. Among non-official Anglo-Indians he must be given a place in the front rank as a man animated by a sense of fairness and ready to acknowledge the claims of Indians for larger privileges. Mr. Fisher is another gentleman coming out from England, who will not, I feel, have any views apart from the evidence and from the assistance he gets from his colleagues. He is put on the Commission for his special knowledge of University education and training, and we have no reason to fear that he will cast in his lot with any extreme member of the Commission. Sir Murray Hammick and Mr. Sly are Civil Servants, and whatever their views may be, we have to accept them as Members of the Civil Service. Mr. Madge of Calcutta, the President of the Anglo-Indian Association, is a quite different politician from the late Mr. W. S. White who was on the last Commission. Beyond the special interests he represents, he will be with the Conservative section of the Commission. For ourselves we have Mr. Gokhale, who is not a provincial, but an all-India representative, and the Indian interests have in him the most capable, the best informed and the most persuasive representative. Mr. Justice Abdur Rahim, though he has never been known as a politician, will be a staunch advocate of Indian claims; and he will fully join Mr. Gokhale in urging the main principle of Indian claims. We may also take it that Mr. Chaudhri will go with them rather than away from them. While we may regret there are not more Indians, we may on the whole be satisfied with the constitution.

The last Public Service Commission was expressly appointed "to do full and final justice to the claims of natives of India." But so far from doing full justice, it did partial injustice. Under this injustice natives of India could not long be content to remain, and it was inevitable that their claims should be more adequately met. The Commission which is now appointed is intended to deal with the entire public service (excluding the

The general efficiency of the Civil Service is not questioned; but the judicial branch of it has time and again been condemned. The Commission will have to consider and determine how the efficiency of this branch can be improved, whether by a change in recruitment or by better training. It is doubtful whether the Commission will venture to recommend such a radical change as will exclude Civil Servants from Judicial office. The Civil Service has vested interests which it is not easy to interfere with; and it will not forego those interests even for the sake of efficiency. The general demand is that the Judicial service must be wholly recruited from the legal profession. If this is done, one part of the difficulty to do justice to the claims of Indians will be removed, for Indian lawyers can be freely appointed by selection, distinction in the profession being the sole test. But the Civil service, though it attaches less importance to the judicial than to the executive line, will not be prepared to wholly forego it.

Then there are other departments such as the Medical, the Engineering, the Akkari, Forest, Post, Telegraph and Customs. All these will be reviewed by the Commission, with a view alike to improve efficiency and to meet the claims of Indians. From all the higher appointments in these departments Indians have been virtually excluded. The exclusion has not been due to any special claims or fixed policy, but rather to a custom which has resisted change. Indians, however capable, have not had their due in these services; the higher offices are still held by Europeans. When Indians are qualified, they must be freely admitted into all these departments, since the security of British rule cannot be said to depend upon who manages a hospital, who constructs a bridge or road, who controls forests, who safeguards excise revenue. Broadly, it has to be admitted that British principles and methods have to be preserved more or less in all departments, and British officers will have to be appointed. But British

officers ought not to exclude Indians, but must work with them so as to impart to them the benefit of British experience. There should be no water-tight compartments for Europeans and Indians, and no exclusive divisions. The European must take the place of the Indian, the Indian that of the European, according to the claims of merit and seniority. The Commission can indicate ways and means to ensure the required degree of merit,—it can say when European qualifications, not European birth, are necessary. Its aim must be to so arrange the constitution of the services as to leave no room for different feelings in the European and the Indian as regards their respective status and rights and their prospects of rise.

LORD CREWE'S GOAL FOR INDIANS.

BY

MR. V. S. SRINIVASA SASTRI.

THE now famous paragraph 3 of the Government of India's Despatch dated 25th August 1911 was conceived in the most lofty spirit of statesmanship that has actuated British policy in India at any period. Its transparent aim was not merely to redress the wrongs and assuage the woes of a sore stricken people, but to strike out a bold policy that should reconcile them perpetually to the British Empire by making it in an ever-increasing degree compatible with their growing aspirations. To this much-interpreted paragraph the true key is no doubt to be found in the statements of the Under Secretary of State for India. Mr. Montagu starts his official connection with India with a vivid perception of the ideas and tendencies of the present time. It is a rare joy to find emerging now and then from the Liberal ranks a young politician of his stamp, endowed with imagination to under-

stand and courage to welcome openly the struggles for constitutional freedom of a people held in political dependence. He has apprehended what may be described as the mind of the despatch, though it may not be the mind of every one of its signatories. The Marquess of Crewe, who first approved of the despatch and, presumably, of the policy enunciated in its third paragraph, subsequently took alarm at the large departures that it involved from current ideas of Indian administration, and sought to explain away its meaning with a degree of earnestness, emphasis and iteration which precludes the theory that he was merely trying to conciliate the reactionaries. The complete and unconcealed satisfaction with which Lords Lansdowne and Curzon received his repudiations points to a feeling in Conservative circles that they have secured from the highest authority in Indian affairs a nullification of the hopes raised by the exuberant language of the Government of India. It is, therefore, necessary that the progressive party in India should place on record their determination to take their stand on the terms of the despatch, which, in their opinion, carry greater authority than the pronouncement of an individual politician, though he may happen to be the Secretary of State for India for the time being.

The attack of the reactionaries, according to the noble Marquess, was delivered along two distinct but congruent lines. They apprehended the gradual weakening of the Government of India, and the corresponding development of autonomous local self-government, and likewise the stimulation of the hopes of Indian politicians towards self-government on colonial lines. Lord Crewe explained that the present policy of decentralization was not designed to bring about a federated system in India such as Bright used to advocate, but that it was only a logical development and slight amplification of Lord Curzon's own ideal. It was easy enough to demolish

Bright's almost forgotten idea of a system of independent local Governments with the Government of India left out. But was Lord Crewe quite in earnest or was he merely adopting a familiar Parliamentary device when he claimed the apostle of centralization as the father of the present policy of decentralization in India?

In place of Colonial *Swaraj*, which is the goal of the Congress party in India, the Marquess of Crewe offers them three boons as constituents of a great programme of liberal reform. What are these? The maintenance of British supremacy in India, the continued devolution of powers from the Supreme to the Local Governments, and the giving of more appointments to qualified Indians. Apparently, the Secretary of State is fully satisfied with their magnanimity. Their real character can be judged from the fact that the Marquess of Lansdowne, no friend of Indian aspirations, hailed them as indisputable axioms of Indian administration. Lord Crewe's liberalism is bankrupt of faith. It is devoid of trust in the principles that have actuated a great and illustrious party in English history for several generations. It casts to the winds the glowing belief in the possibilities of humanity that has underlain all the great movements of history and forswears all schemes aiming at the progressive equality and brotherhood of the world's peoples.

Fancy a liberal Secretary of State for India, who has been deservedly hailed as initiator in part of a great era of hope, proclaiming the impossibility of self-government for the Indian people on the ground of their race, and bidding them be content in perpetuity with careers of service in the Empire as contradistinguished from careers of distinction! This surely is an unkind cut. What an answer to those who claim the benefits as well as the burdens of Empire! We have borne these cheerfully and shall bear them cheerfully in the hope that in the fulness of time

we shall be enabled to rise to the full height of equality and freedom possible within the British constitution. The ideal of service contrasts no doubt favourably with the ideal of distinction, but it is only as applied to individuals and not to whole communities. All honour and glory to those great ones, who, with distinction placed within reach of their hands, elect deliberately to renounce it. But the Marquess of Crewe invites a whole nation to condemn themselves and their posterity as unworthy of distinction in their own country by reason of inherent defects. Surely 'virtue is its own reward' is a maxim that ill becomes a master who refuses to raise the wages of his servants. And it does not lie in the mouths of those who hold a practical monopoly of power and distinction in a country to pronounce against the people of that country the doom of unredeemed and unending servitude.

It is necessary, though for some reasons unpleasant, to recall the history of the goal of Indian political aspirations so emphatically repudiated by the Marquess of Crewe. For many years after the inception of the Indian National Congress its leaders were content to go along without committing the movement to a definite ideal. Of course individual politicians could not forbear occasionally to dip into the future, and as early as 1885 Colonial self-government had become a popular ideal, largely owing to the publication of Sir Henry Cotton's *New India*. But the cry was never raised from the Congress platform till Sir Henry Cotton himself gave expression to it in his presidential address at its Bombay Session of 1904. The first authoritative enunciation of the Congress goal was made in the constitution adopted in 1908 under stress of circumstances which will be long in fading out of people's recollection. Suffice it to say that the country was at that time seriously agitated, not to say disturbed, by the prevalence of ideals inimical alike to British supremacy and to peace and order. All eyes were turned with anxiety to the

action that the leaders of the Congress party might take, and there can be no doubt now that it was their clearly and firmly expressed determination to remain within the British Empire which contributed in a great measure to the restoration of tranquillity. At the present moment it is no exaggeration to say that the ideal of self-government within the Empire is accepted by all schools of political thought in India. It is inconceivable that a lower ideal than that of Colonial *Swaraj* would have satisfied a self-respecting people. The Congress party paid indeed a great tribute to the liberal character of the British Constitution in embracing this ideal. Subject to difference in detail which the British Indian statesmanship of the future will know how to adjust, they trust that there is scope within the constitution for India to grow by gradual steps from its present status of dependency to full fraternity with the other members of the Empire. Neither the expediency of the hour nor the large wisdom that looks beyond will justify the denial at this juncture of such possibilities to the people of India or such capacities of adaptation to the British constitution.

That Asiatic races never had, and therefore never can have, any real self government is an old theory held by Conservatives like Salisbury, Mr. Balfour and Lord Curzon. It is sad, though not altogether surprising, that it should be advanced by a tried Liberal like the Marquess of Crewe as a reason for Indians being held in perpetual dependence. Race itself as a cause of difference between nations is nowadays being questioned by scientific observers. Weighty authorities incline to the view that environment and the struggle for existence are sufficient to account for the history and tendencies of peoples, and that race plays a subordinate, if any, part in moulding their destinies. It is no doubt a convenient reason for maintaining the inequalities that have come to exist, and is on the same footing as the theory of individual desert which the haves

have always urged against the have-nots. Even were it otherwise, are the racial qualities of Indians so entirely devoid of the elements necessary to make a self-governing people? The civilization of India has stood the inexorable test of time and has received in the course of its long history many elements of strength and variety. The Rajput has given it his stern chivalry, the Musulman his keen, almost jealous, sense of honour, the Mahratta his endurance and hardness, the Parsi his wideawake enterprise and adaptiveness, and the Brahman his subtle and pervasive intellect. And every day now the Briton is pouring into this rich and complex life his energy, organised knowledge and vastly multiplied power and efficiency. No one who has not peeped into the Book of Fate can deny to such a people a destiny as great and glorious as any that has been vouchsafed to man. No, Lord Crewe cannot stay the march of India any more than King Canute could still the waves of the sea. A great ideal, provided it be not ignoble or disloyal, once planted in the hearts of a people, cannot be killed. Step by step, with many halts and goings back but ever taking fresh starts, it must in the end realise itself.

[In connection with the above article the following extracts will be found useful reading. Ed. I R.]

Paragraph 5, Government of India's Despatch, dated 28th August 1912.

The maintenance of the British rule in India depends on the ultimate supremacy of the Governor General in Council, and the Indian Councils Act of 1909 itself bears testimony to the impossibility of allowing matters of vital concern to be decided by a majority of non-official votes in the Imperial Legislative Council. Nevertheless it is certain that, in course of time, the just demands of Indians for a larger share in the government of the country will have to be satisfied, and the question will be how this devolution of power can be conceded without impairing the supreme authority of the Governor General in Council. The only possible solution of the difficulty would appear to be gradually to give the provinces a larger measure of Self Government, until at last

India would consist of a number of administrations, autonomous in all provincial affairs, with the Government of India above them all, and possessing power to interfere in case of misgovernment, but ordinarily restricting their functions to matters of Imperial concern.

Mrs. Montagu at Cambridge on February, 28.
 "Where the difference lies is in this, that we have endeavoured to look ahead, to co-ordinate our changes in Bengal with the general lines of our future policy in India, which is stated now for the first time in the Government of India's Despatch that has been published as a Parliamentary Paper. That statement shows the goal, the aim towards which we propose to work not immediately, not in a hurry, but gradually.

We cannot drift on for ever without stating a policy. A new generation, a new school of thought fostered by our education and new European training has grown up, and it asks, 'What are you going to do with us?' * * We have never answered that, and we have put off answering them for so long. At last, and not too soon, a Viceroy has had the courage, to state the trend of British policy in India and the lines on which we propose to advance."

The Marquess of Crewe in the House of Lords on June, 24.

The experiment of a measure of Self Government, practically free from Parliamentary control, to a race which was never our own, even though that race enjoyed the advantage of the best services of men belonging to our race, was one which could not be tried.

The Marquess of Crewe in the House of Lords July, 29.

"I reiterate that there is nothing in the teaching of history or of the recent conditions of the world which can make the dream of complete Self Government in India within the British Empire even remotely probable.

"I can imagine there are gifted, most estimable, men loth to abandon the idea that they or somebody like them may be the Premier of an Indian Dominion or the Commander-in-Chief of an Indian Army, but I think it is only those who think less of service and more of distinction who would lose heart if they braced themselves to set aside this vision altogether and settle down to closer co-operation with this Western race for the moral bettering of the country to which they are so deeply attached and of which we are so proud to be the Government.

Patna

BY MR. RALPH E. SMITH, B. A.

THE Coronation Durbar is long past and the discussion aroused over the administrative changes announced by His Majesty the King-Emperor has perhaps spent itself. But in one particular there is something left to say. The readjustment of the boundaries of the province of Bengal and the transference of the capital of India to Delhi have been changes of such magnitude and importance that they have filled the horizon of thought. And of Delhi, its history, its importance, its present making and its future greatness, columns have been written. Delhi is now the capital of all India and it is therefore not wonderful that at the present time it overshadows Patna, which has become the capital only of the new province of Behar and Orissa. And yet in many respects Patna is the more important city of the two.

Delhi was the capital of the great Moghul Empire that at one time embraced nearly the whole of the Indian peninsula; Patna was the capital of Magadha, the first of the Indian Empires. Delhi was the Mohammedan city; Patna was the Hindu, Buddhist and Jain city. Fascinatingly interesting as it is, the authentic history of Delhi dates only from the eleventh century A. D.; the authentic history of Patna begins with the fifth century B. C. Patna has been the capital of great kingdoms and empires and the chief city in the land where both Buddhism and Jainism arose. It therefore derives importance from both religious and political considerations.

The diligent and painstaking research and the translations of a small host of European scholars, such as Burnouf, Rhys Davids, Max Muller, M'Cridle and others have brought much of the history of this ancient city to light.

The name Patna is derived of course from a Sanskrit word and means "The City",—not an uncommon way of designating the capital of a country, as e.g. Kandy in Ceylon, at one-time capital of that country, was and is to-day called in the Singhalese language "The City". The name under which Patna began its history however, was Pataliputra (Lotus City). And we are fortunate enough to possess a reliable historical reference to the founding of the city.

Among the religious writings of the Buddhists there has been preserved a history of the Life of the founder of the Buddhist religion. In it an account of his last journey is given. In the course of this journey it is related that he crossed the Ganges at the point where the Son¹ joins it and that at the time, Ajatasatru, King of Magadha, was building a fort on the spot to keep the Wajjians in check. This fort was the beginning of the city that is now to become the capital of a new province in British India. Gautama died the same year, and, although there is some divergence of view as to the exact year in which this occurred, scholars now generally favour a late date such as that suggested by Rhys Davids, i. e. 412 B.C. So that we have a fairly definite date at which to begin the long history of this interesting city.

Now we learn that in the days of Ajatasatru the kingdom of Magadha had a circumference of 2,300 miles and contained 80,000 villages. Its capital was at Rajgriha, the ruins of which may still be traced near the modern Rajgir. The earliest known king of Magadha was Sisunaga, who is thought to have reigned about 600 B.C. The fifth monarch of this line was Bimbisara who became one of the first converts to Buddhism and the lifelong friend and helper of the founder of that religion. He extended the boundaries of his kingdom by the conquest of Anga and Monghyr, but was finally deposed, imprisoned and slowly starved to death by his son, Ajatasatru, the founder of Pataliputra. Ajatasatru destroyed the

Wajjian clans and warred with Kosala and Kosambi till he made Magadha supreme among the surrounding kingdoms. One of his successors removed the capital of the kingdom to Vesali where, under king Kalasoka, in 380 B. C. the second Buddhist council was held. Kalasoka, soon afterward removed the capital to Pataliputra, and Pataliputra's history as an Indian capital began.

The Nanda dynasty followed the Sisunaga dynasty and at the time of the invasion of India by Alexander the Great, Dhanananda, the last of the Nandas was reigning in Pataliputra. Alexander was told that his army consisted of 200,000 infantry, 20,000 cavalry, 2,000 four horse chariots and 3,000 elephants-of-war. Magadha was famed for the training of elephants and it was doubtless skill in this art that gave her supremacy among the surrounding peoples. Alexander never reached Magadha, although he was informed that on account of the unpopularity of the monarch an attack on the country would prove an easy success. His victorious march over north-western India was arrested on the banks of the Hyphasis by the murmurings of his troops who refused to advance further, and after ineffectual efforts to arouse their courage he was forced to turn back.

What he was turned aside from doing was soon afterward performed by a young adventurer, named Chandragupta. A series of events at this time combined to raise this energetic and resourceful young man, not only to the throne of Magadha but to the proud position of the first Chakravarti or Emperor of India. The history of his early life is not clear. One account makes him the son of King Dhanananda, though not by his queen, but by a woman of low caste.

Buddhist writers, on the other hand, as we learn from M'Orindle's valuable translations, tell us that he was the son of a king of a little Himalayan kingdom, called Maurya, from the great number of its peacocks (Mayura means

peacock). This king was killed in resisting an invasion of his enemies and his queen fled to Pataliputra and was there delivered of a son whom she exposed near a cattle shed. The boy was found by a shepherd who named him Chandragupta (Moon-Protected) and took and cared for him till he grew to boyhood.

At this time there lived in Pataliputra a Brahmin, deformed in body and unscrupulous in character, who cherished a grudge against king Dhanananda because of an insult the king had offered him. Chansky was his name, and when he discovered that the boy whom the shepherd had found was of royal descent and was an energetic and courageous youth, he bought him and gave him a training fitted to a king's son, with the object of making him the instrument of his revenge. And ever after he remained the young man's constant adviser. When Chandragupta had grown to manhood Chansky put him in command of troops whom he had been keeping secretly in his pay and a rebellion was raised. It proved abortive and Chandragupta was defeated and fled. He took refuge for a time, so the Mahavamsa Tika, a Buddhist book of Ceylon, informs us, as an unknown stranger in a peasant's cottage. One day the woman baked a chapatty and gave it to her child. He, leaving the edges, ate only the centre and, throwing the edges away, asked for another cake. Then she said, 'This boy's conduct is like Chandagutta's attack on the kingdom'. The boy said, 'Why, Mother, what am I doing, and what has Chandagutta done?' 'Thou, my dear' said she, 'throwing away the outside of the cake, eatest only the middle. So Chandagutta, in his ambition to be monarch, without beginning from the frontiers, and taking the towns in order as he passed, has invaded the heart of the country and his army is surrounded and destroyed. That was his folly. These homely words of wisdom did not fall on unheeding ears. Chandragutta heard, recognized the wisdom of

them and formed new plans and resolves for the conquest of Magadha.'

He found his way to the camp of Alexander the Great, where, however, his arrogant manner so irritated the impatient Macedonian that on one occasion he was minded to slay him. Had he done so he would have robbed Indian history of one of its most interesting figures and the creator of the first Indian Empire. Alexander, having set Porus, the old Indian king, and other satraps over the Provinces he had conquered in India, turned his face homewards and reached Babylon in 324 B.C., where the year after he died. Shortly after this King Porus was slain by his Greek General, Eudemos. Before Eudemos could make himself king however, a revolt in another part of the province called both him and his army. The Indians immediately rose in revolt, and Chandragupta, who had been leading the life of a robber chieftain on the borders, placed himself at their head and soon made himself master of the Punjab, drove the Greeks out of India in a short time, established his rule over all the Indus provinces. He then turned his face towards Magadha.

Meanwhile in Magadha a barber's son had become a paramour of the queen and with her aid had slain all the princes of the royal house and usurped the throne. He was thought, however to betray by his conduct, traces of his humble origin and was very unpopular. When, therefore Chandragupta swooped down upon the country it fell an easy prey to him and he stepped into the vacant throne.

This was in 315 B.C. Stimulated, doubtless, by the example of Alexander's great empire, his boundless energy and ambition soon led him forth on a career of conquest. Kingdom after kingdom fell before him until all northern India from the Himalayas to the Vindhya mountains and from the mouth of the Ganges to the Indus and beyond, including Guzerat, was brought under his sway and the first great Indian Empire

was formed with Pataliputra as its capital. The uniting of so much power in one individual mightily impressed the people and he was given the title of Chakravarti i. e. "Universal Monarch."

Seleucus Nicator, the successor of Alexander in Babylon and Syria, when he had settled affairs at home, invaded India to reclaim the lost provinces. But he was met by the consolidated power of Magadha under Chandragupta and after an unsuccessful campaign found it expedient to conclude a peace by which he surrendered all his provinces west of the Indus and gave his daughter in marriage to Chandragupta in return for 500 elephants-of-war.

At this time Megasthenes was sent to Pataliputra as Greek ambassador to the court of Chandragupta. It is to this circumstance that we owe so much of our knowledge of that ancient city, for while there Megasthenes employed his leisure time in writing his "Ta Indika" in which he gives us an account of the country and the city in which he was a sojourner. The book itself has been lost but the quotations from it in ancient European writers are very numerous.

He informs us that Pataliputra was the greatest city in India at that time. Being built on the tongue of land between the Ganges and the Son, at the point where these two rivers meet, it was long and narrow. He informs us that in the inhabited quarters it stretched to an extreme length on each side of 80 stadia (nearly 100 miles) and that its breadth was 15 stadia and that a ditch encompassed it all around of 600 feet in breadth and 30 cubits in depth, and that the wall was crowned with 570 towers and had 64 gates. That is there was a tower (probably for archers to shoot from) every 75 yards and one gate to every 660 yards. He tells us, too, that the wall was wooden and that it was pierced with loopholes for the discharge of arrows.

The municipal affairs of this great city were--

managed by a commission of 30 members which was divided into 6 departmental boards of 5 members each. It was the duty of one of these boards to keep an accurate register of births and deaths. This commission was not an elected council it is true, but one is nevertheless surprised to find in such ancient times a municipal government that was so well organized, for efficient service.

The War office of the Government was similarly administered by a board of 30 members, divided into 6 boards of 5 members each, charged severally with the care of the admiralty, transport and commissariat, infantry, cavalry and war-chariots. There was an irrigation department and the land revenue was collected by regular revenue officers. The palace was an extensive pile of probably, wooden buildings in a pleasant park well furnished with ponds and trees. The sovereign in person attended to the administration of justice and would continue to hear cases while even his toilet was in progress. The royal sport of hunting was organised on an elaborate scale.

When we remember that from Pataliputra this vast empire 1,500 miles in extent and, in some places, nearly 1,000 miles wide— was administered in a time when there were no railways or roads, and that it was so firmly held together that it passed down to son and grandson with no disturbance, we must admit that the man who won, maintained, organised and administered it was a man of no ordinary ability.

Of Chandragupta's son, Bimbisara, we know little save that he reigned for about 22 years (291-269 B. C.) and that he was called "Amitrochates," foe slayer, by the Greek and Greek ambassadors who continued in Pataliputra during his reign.

Of Chandragupta's grandson, the great Asoka, who was crowned at Pataliputra in 269 B. C., we know a very great deal, for inscriptions of his are to be found on pillars and rocks all over India to

this day and Buddhist literature is loud with his praise. He conquered Kalinga at the beginning of his reign and established some sort of suzerain power over most of the southern kingdoms. So that in his day Pataliputra may almost be said to have been the capital city of India. Asoka changed the outward appearance of Pataliputra. He replaced the wooden walls with masonry ramparts and filled it with palaces, monasteries, and monuments, the ruins of which as McCrindle tells us, lie entombed 12 or 15 feet beneath the Patna of to day, awaiting proper excavation and identification. It has been shown that an artificial hill of brick debris, called Bhiknapahari, which is over 40 feet high and about one mile in circumference and upon which is now situated the residence of one of the Nawabs of Dacca, is the hermitage hill built by Asoka for his son Mahendra. Fragments of a polished column, the outline of monastic cells, carved stones and other remains, point out the site of the old palace of Asoka, and Dr. Waddell places the site of his later palace in Sandalpur. South of this near the railway is a big flat stone, to which the marvellous story clings that it cannot be taken away but always returns to its place. In another hamlet is a sculptured pillar in polished hard sandstone of a pair of matris (divine mothers) of a very ancient style of architecture. In the land to the South are brick ruins of 5 relic stupas of exceptional grandeur which Asoka is said to have built.

Pataliputra was an important religious centre, for the land of Magadha of which it was the capital and was the birthplace of two of India's great religions. Both Jainism and Buddhism arose here and at about the same time. And for a long time Buddhists looked upon Magadha as their "Holy" Land. At one time streams of pilgrims from Mongolia, China and other Buddhist countries, found their way to India. In 310 B.C. the first Jain council was held in Pataliputra at

a time however when a famine in Magadha had driven most of the Jains to the south. In the 8th year of his reign Asoka became a Buddhist, and in the 18th year of his reign he convened the 3rd Buddhist council in Pataliputra. 1000 monks assembled and the deliberations of the council lasted 9 months. The council is important for, at its close, Buddhist missionaries were sent out into the north, south and west of India, into Ceylon, the Panjab and Kashmir. And thereafter the spread of Buddhism did not cease till it had covered Burma, Siam, Nepal, Tibet, Mongolia, China, Korea and Japan. Asoka became a very zealous Buddhist and at one time is said to have supported 64,000 Buddhist monks in Magadha alone. From this circumstance the country obtained its present name Behar, which comes from the word *Vihara* meaning a monastery.

Asoka died in 231 B.C. and although the Maurya dynasty continued after him till 184 B.C. it rapidly lost territory. The commander of the army slew the last of the Mauryas and seized the throne and so established the Sunga dynasty. This was followed by the Kanva dynasty, under the kings of which the kingdom rapidly crumbled to decay. In 27 B.C. a monarch of the powerful Andhra kingdom to the south slew the last of the Kanvas and annexed his dominions. We have no history of Pataliputra during this period. It probably remained the capital of the kingdom but was shorn of its former grandeur and with the extinction of the kingdom ceased to be of importance.

In 319 A.D. however, 634 years after the founding of the first empire it once more comes on to the stage of history as the capital of a great empire, under the name of Kusumapura. The tribe of the Lichchhavis, who, in the very early days of the Magadha kingdom, had been conquered by king Ajatashatru, once more became an aggressive people and extended their power across the Ganges and occupied the ancient im-

perial city of Pataliputra. A local Hindu chief who bore the name of Chandragupta, married a Lichchhavi princess and in 319 A.D. became the king of Pataliputra and in a short time made it a paramount power in what is now Behar, Oude and the valley of the Ganges as far as Allahabad.

His son Samudragupta, who ascended the throne in 326 A.D. was one of the most accomplished princes that ever graced an Indian throne. He was a musician, poet, and liberal patron of Sanskrit. He conceived the bold design of subduing all India and carried his arms across the Vindhya mountains and even to the extremity of the peninsula. Eleven kingdoms to the south submitted to him and 9 kingdoms in the north. The southern kingdoms were too remote to be held in permanent subjection. But it may be said that for a time at least Pataliputra became once more the capital of an empire that embraced nearly the whole of India. And Samudragupta caused to be revived and celebrated the long obsolete "horse-sacrifice" which could only be celebrated by a monarch with undisputed claims to universal dominion. And during his long reign of about half a century his court became a great and glorious one and many embassies and complimentary presents came to him from many strange and distant lands. At some time during his reign he is said to have removed his capital westward and about the only traces of the Guptas now to be found in Pataliputra is a broken pillar among some Mahomedan graves.

Pataliputra remained, however, an important Buddhist centre during the period of the Guptas. In the reign of Samudragupta's son, Chandragupta II, whom his father chose from among his sons as the best fitted to govern, and who by his actions justified his father's choice, a Chinese pilgrim, named Fa Hien, came to India to visit the sacred land of the Buddhists and in quest of images and sacred books. And the writings which this writer has left throw much light on the state

of India at that time (406-411 A. D.) He tells us that Pataliputra was still a populous and flourishing town. It contained two Buddhist monasteries, one devoted to the older and one to the newer form of Buddhism, which accommodated 600 or 700 "learned" monks to whom people flocked from all parts for instruction. He gives a brief account of the administration of that time with which he was very favourably impressed. Among other things, he tells us that no respectable person engaged in hunting or in the sale of flesh—and all decent people abstained from eating meat, onions and garlic and from drinking intoxicating liquors. So that Pataliputra and other towns near it contained no butcher shops or taverns.

Kumaragupta (414-455 A. D.) was the 4th of the Guptas. He maintained the integrity of the empire but toward the close of his reign he was troubled with incursions of the White Huns—the same who so harassed the eastern provinces of the Roman Empire in the reign of Theodosius. In battle with them he met disastrous defeat. This was retrieved by his son Skandagupta (455-480). But toward the end of this monarch's reign the troubles were renewed and led, at his death, to the disrupting of the empire.

The 6th century is a time of confusion and connected history is difficult. But in 606 A. D. Harshavardhana, called also Siladitya, became king of Kanouj in the west and at once set about the subjugation of all India. For 6 years his armies had no rest "nor did the elephants put off the trapping of war". And soon there once more arose an empire embracing the whole of northern India. But this time the capital was at Kanouj and not at Pataliputra.

Pataliputra fell into ruins. Hiouen Tsiang, a learned Buddhist pilgrim from China who travelled over India from 629-648, tells us that at this time Magadha was subject to Kanouj and that Pataliputra was in ruins, although a new Patali-

putra had sprung up near it. He gives the circumference of the ruined city at 12 miles.

History tells us little of the city in the succeeding centuries. But it would seem that it never regained its ancient importance as a royal city. Kanouj remained the greatest of the Hindu states down to the time of the Mohammedan conquest in the 11th and 12th centuries. Delhi then became the seat of power and gradually rose into prominence till it became the capital of the whole of India.

During the Mohammedan regime Sher Shah revolted, and under him Pataliputra once more became the capital of an independent state, but was soon reduced to subjection by Akbar in 1575. The Emperor Aurangzeb made his son Azim the governor of Patna, from which fact it acquired the name of Azimabad, a name still in use among the Mohammedans of Patna.

In 1763 there occurred at Patna the event which brought to a conclusion Mohammedan rule in Bengal and led to the establishment of British rule. A dispute arose between Mir Kasim, the Nawab of Patna, and the East India Company, over transit duties. It ended in the Nawab driving out the Company's sepoys and killing nearly all of them. The remainder surrendered and were imprisoned along with their English officers and the entire staff of the Cossimbazar factory. War followed and Mir Kasim was defeated in two pitched battles in August and September 1764. As a revenge he ordered all the prisoners in his power to be slain. This order was carried out with the help of a Swiss renegade named Walter Reinhardt. Sixty Englishmen met their death and their bodies were cast into a well belonging to the house in which they had been confined. Fifty others were slain in other parts of Bengal. But the war that followed led to the complete overturning of Mahomedan rule and Patna and all Orissa and Bengal passed into the hands of the British.

every Camp, so that all kinds of *Purdahs*, coverings screens and veils had to depart from Delhi for a time and take refuge in some far distant place ! The Fort was taken without the lectures of any social reformer and the results of the victory are still extant. Many men do not wish to forego the advantages then gained of bringing out their wives, and they still keep it up from time to time.

Various Camps were decorated in various ways. But none could bear comparison with the Kashmere Camp, the outer walls and gates of which were of Kashmere wood work and the inner tents draped and spread with the costliest and rarest embroidered shawls and carpets. We hear the invaluable gate and walls of the Kashmere Camp have been presented to the King-Emperor who was greatly struck by them, and who has accepted the gift with great pleasure.

For some days before the arrival of Their Majesties, rehearsals were the order of the day. All of a sudden one would learn that on the morrow such and such a part was going to be rehearsed, so that such and such roads and crossings would be closed to the public from early morning to a certain fixed hour. Should one unwary pedestrian, rider or motorist be led astray into one of these forbidden paths within the prescribed limit of time, he would find himself unable to retrace his steps through the dense crowd, much less pursue his course ahead. The English sertry on duty would politely address a lady "very sorry madam, can't let you pass. We are in possession."

On December 5th the Delhi Branch of the *Bharat Stri Mahamandal* gave a party to the Rani, Begums and other ladies assembled in Delhi, at which the wife of the Lieutenant-Governor of the Punjab and several English ladies of position from other Provinces were also present. On receiving the invitation every one said, "So the Durbar functions have begun from the 5th." Some

Ranis keenly looked forward to the day and eagerly requested us not to omit inviting so and so, as they had never seen them, and would like very much to be so.

But the organisers of the party were hard put to it that day, poor things ! The night before they heard that the rehearsal of the arrival in Delhi would take place that day, and that the roads would be closed from 6 A.M. to 12 noon. This news came upon them like a bolt from the blue. If the roads were closed till 12 O'clock, when were they themselves to be at the place of entertainment, when were they to decorate it, and how were they to be ready to receive every body by 3 in the afternoon ?

However, there was no help for it. We trusted the mistresses of the Girl's School in which the party was to be held would carry out the preliminary preparations. The next day the organisers started for the school at 12 O'clock. The roads were still packed with soldiers. There was no sign yet of their being open. From twelve to three the ladies had to sit tight in one place and wait in their carriage. Meanwhile, as they looked at their watches and found minute after minute and hour after hour passing, their hearts sank within them. "Oh! how we shall be put to shame!" The whole carriage full of wives and daughters kept praying, "O, Krishen Ji, O Parmatman, O Raghunath, preserve us from shame, deliver us to-day from this difficulty, grant us a successful pass-off for this day's party!"

At nearly 3 o'clock, the hour for the arrival of the guests, the hostesses arrived at the School. The nice sofas and chairs which had been sent on by coolies at 5 in the morning also arrived that time. Their idea of decorating the inner courtyard had to be abandoned, and everything hastily arranged in a comparatively small space. "Have the flower garlands come?" "No. The men sent have not yet returned, the road on that side is still closed, the button-holes have arrived." "The

gold-leaf covered pan?" "Not yet." "Then send for plain pan at once from the nearest shop." "Rose water?—and the scent spray?" "The spray is here, but the rose-water has not yet come." These and such like questions and answers were being exchanged, when a hue and cry arose. "Where is Mrs. ———, send her quick, a motor has come, some one has arrived, it is the Lieutenant Governor's wife! Come along soon and receive her." With English punctuality the carriage of Lady Dane has arrived at the door exactly to the minute. She is accompanied by her daughter and the Punjabi Rani. Henceforth the stream of motor flows without ceasing. Within an hour the courtyard of the Indraprast Hindu Girls' School is filled with a charming array of the sun-secluded Ranis and Begums of the famous Chiefs of India. The whole town was anxious to receive invitations for this day, but unfortunately besides members we were only able to invite a few select families, for want of space.

On account of the road-closing business many people, even the wives of the Governors of different Provinces, found themselves in sore strait from time to time. On one occasion for this reason Lady Hewett was unable to attend a party given at a Begum's house and was put out for not having been able to keep her engagement.

THE ARRIVAL.

On the 7th December the King-Emperor and the Queen-Empress set foot in Delhi. In order to see them one had to buy tickets for the stands erected in different parts of the route just as in Calcutta. Besides there was another advantage in Delhi. Here the Emperor passed through the City. So that one had the chance of seeing him from the terraces and verandahs of the innumerable houses on either side of the street. On that day thousands of men and women became the uninvited guests of the hosts and hostesses whose houses faced the Royal Road. Many had risen at 3 or 4 o'clock in the morning and begun

their preparations. Some had cooked their *puris*, vegetables and sweetmeats overnight and done them up in packets. Some ladies arrived at 5 o'clock before a certain person's house, having regard to the cold weather, however, they did not wake up the household at that early hour but quietly sat in the carriage till sun rise. When day broke and the front door was opened, they went inside the house and took possession of a great portion of the verandah. They had taken with them blankets and *Darris* to spread on the ground and even *Mohras* and cane chairs. Besides, a couple of servants were in attendance all the time, and supplied them with *pans*, *puris*, vegetables, sweets, fruits, and other necessities of daily life whenever they were in need. These ladies had bought Rs. 100/- worth of tickets at a particular stand but had forfeited them preferring to come here as they had heard they could see better.

My hostesses at Delhi had gone to a comparatively uncomfortable place themselves and sent me to the above place, the mistress of the house being a relative of theirs. As soon as I arrived there empty handed, without any necessary preparations I became the guest of all acquaintances and non-acquaintances. Those who had arrived early and taken possession of the place first, received me with open arms. I was addressed variously as "*Mataji*", "*Bhaiji*", "*Bahuji*" or "*Bhabhiji*" by various persons and made to sit on the best position of the vantage ground they occupied. Out of two chairs one fell to my lot, and on that were spread three or four layers of blankets, to make the seat soft and warm. My small boy became a great pet with them, and his care was taken off my shoulders, nor was his servant allowed to attend to his needs any more, his newly found relatives doing everything for him.

One of the houses opposite was packed with people from head to foot. Our house was just the same: there were men on the roof, women

first floor, and again men on the ground floor. We could not see the picturesque effect of our own house but the grouping of the opposite house was charming. There were several familiar faces amongst them too, who greeted me with bows and smiles. They had only women on the first floor, but men and women both on the terrace, some with *pan* boxes, others with boxes of sweet which were being distributed every now and then amongst the children.

When I arrived the roads had not yet been closed. Soon after, about 8 o'clock, 2 bands of Sikh Soldiers came and stood in a row on both sides of the road and closed it. They wore a red uniform with yellow facings and a big iron circlet on the turban. First they dragged one or two barrels into position on one side of the foot-path, then stood in a row. Only two English Officers wearing the same uniform stood at some distance; all the other officers were Sikhs. Shortly afterwards we noticed a stir in the ranks, some word of command had been given. We could not catch the words, but the result was we saw the Sepoys take out a box each from the knapsacks slung across their shoulders and extract their breakfast therefrom,—dry bread and onions, or a little vegetable for some. The work of chewing and swallowing proceeded quickly. Then the Sepoys drew and drank water from the aforesaid barrels, washed their hands and faces, gave the remains of their food to the sweepers standing in the street, cleaned their boxes and put them into their bags, gave all the knapsacks into the charge of a Sepoy in a carriage drawn by mules and stood again spick and span each in his own row to await the arrival of the Emperor. I think the same action must have been performed at the same time all along the line of six or seven miles that the rows of Sepoys were stationed on both sides of the roads.

Hour after hour is passing by. The Governor-General's carriage with its occupants has gone to-

wards the station, one or two miscellaneous Rajahs have passed by too, the Imperial Cadet Corps have also disappeared from view on horseback after dazzling the arena with their silver uniform and blue turbans, yet there are no signs of the King Emperor's arrival. Suddenly the cannon boomed boom! boom!—it went on everlastingly, a hundred and one times. The King-Emperor has arrived at the Station. The front ranks of Sepoys presented arms to order—hundreds of guns were held upright at the same instance, from hundreds of boxes shot was brought out and rammed into them at the same moment, hundreds of loaded guns pointed skywards and roared out at one and the same time, and like the roar of thunder, their rumbling sound rolled on for a long time. Immediately afterwards the "Jalus" or procession was formed. First various Regiments in red, yellow, black, and green uniforms, marched on each with its own band playing. The European or Indian Drummer of every Regiment wore a Tiger-Skin, every English Officer wore a uniform matching the colour of his Regiment, with a shawl *Cummarband* and a black and gold *Cheek-Pagri*. The black head gear was becoming to the white faces, and looked ever so much better than the Englishman's own dress. Then came the Viceroy's Body Guard, then the picture of the Imperial Cadet Corps was again displayed with its Indian Rajas and Princes riding on white horses. After this we again saw splendidly dressed heralds, with swelling chests and eyes fixed exactly in a straight line with the nose, then came a few English Officers on horseback, with plumes on their helmets, and immediately behind was the Empress' carriage, with the state umbrella held over it. The band played "God Save The King", the flags held by the Sepoys on the road were lowered to the ground. Such deference for womanhood and Empresshood! For a moment we forgot the Emperor, but as the Empress' carriage

passed on, every body looked sharp again where was the Emperor? Every-body asked every-body else "Has not the Emperor come yet?" They hoped he was coming behind. But Lord Hardinge passed by, the Emperor's guests passed, the Nizam passed, the Gekwar passed, Mysore passed, the Maharaja of Kashmere passed before the expectant eyes of thousands of spectators in a deep sleep, with his eyes closed and head on one side, completely indifferent to all the noise, all the crowd, and all the eagerness. Yet the Emperor came not and no body saw him. It was as it were a mute and melancholy procession that passed quietly and silently by. No King, no Emperor, only the Empress! What was this? Then the R-jas' suites followed in a stream, gold and silver carriages, followers in various uniforms, horses with various trappings, bands with various tunes. The Raja of Sikkim's suite had one kind of uniform, the Raja of Bhutan's had another fancy kind, the Burmese King's was peculiar, and a Central Province Rajah's more singular still. Here the Begum of Bhopal appeared on the scene, in an open carriage wearing the purdah over her face, and bowing right and left in response to salutations, the Resident Sahib seated on her left and her grandson in front. A great commotion arose amongst the feminine spectators—"Fie, for shame, the purdah on one hand and a strange man sitting beside her on the other!" One woman spoke up for the Begum, saying, "Well, what is she to do, it is the order of Government that the Resident must sit by her," But the justification satisfied no body. They all began talking loudly "Indeed! if Government had ordered her to come barefaced, would she have done so? Then how could she agree to have a strange man sitting beside her? If she had told them that this would compromise the dignity of a purdah lady, Government would never have insisted on the Resident's sitting near her." Various comments were made amongst those present,

several of them being Mohammedan ladies of the Begum Sahib's own persuasion.

When the last remnants of the procession had vanished from sight and every one returned home, elbowing their way through the home-bound crowds even then the same question was on every lip "did you see the Emperor?" "Could you make him out?" Nobody had seen him, nobody had recognised him. A rumour spread through the town that the King-Emperor had not joined the procession, he had been hidden from sight by Sir John Hewett's representations. Some said—"No, he was on horse-back, but no body knew which horse." Some said he has shaved and come to-day so that none should know him and no evil person could carry out his evil designs. In short everybody was very disappointed and dissatisfied, not to see the King-Emperor for whom all had undergone such privations and had remained foodless and sleepless from early morning till 4 o'clock in the afternoon, for whom all these preparations and all this trouble had been undertaken—to think that no one should see him, that he should have kept himself concealed, that there should be the play of Hamlet without Hamlet in it.

The people did not see their King that day but soon after he had entered Delhi, the Indian Rajas, their Chief Officers and the Governors of different provinces assembled on a hill prepared to welcome him. After the procession the Emperor and the Empress went there for the reception and then proceeded to their tents.

The next day there was another crowd on both sides of the road to witness the procession of the King-Emperor through a part of the town to lay the foundation stone of the King Edward Memorial. Every day something like this happened. Except that first day, on every other day the King-Emperor sat in the carriage beside the Empress—and as the State Umbrella was held over him there was no difficulty in recognising him henceforth

But nothing could compensate for the blank of the first day!

THE DURBAR

The Durbar day arrived. The Durbar Amphitheatre was somewhat like that of Calcutta, but much prettier and much bigger. Fourteen thousand men and women sat in it. Different blocks were set apart for the accommodation of different provinces, so that friends and relations who happened to have come from different parts of the country did not meet each other. I searched in vain for two bubbles in this human sea, my brother and his wife, at whose sight the bubble me would have burst into recognition and joy. But as he had come as a Bombay officer and was in the Bombay block and I was with my husband in the Punjab we did not see each other. Many others were in similar strait with regard to their own nearest and dearest relations.

In front of the Amphitheatre was a round high building like the bandstand in the Eden Gardens of Calcutta. On the topmost gallery of which two thrones were placed with chairs below and around. A few yards off facing another set of spectators was another round stand on which there were only two thrones.

Opposite the Amphitheatre for miles there was a semi-circular mound where thousands of the masses had found room. This crowded far-stretching crescent looked very pretty indeed, as if variegated flowers were blooming in a huge garden. From a distance no faces could be seen. Only here a large patch of yellow—there a big patch of blue, again a good patch of all red, and in between a mixture of white, black, green, pink and every conceivable colour. It seemed as if many coloured balsams had flowered in a terrace garden of vast proportions. I had never before seen such an array of colour.

As "God Save the King" struck up thousands of men and women stood up. The carriage of the Viceroy and his wife came and stood before the

deais opposite. They got down and sat on two chairs placed beneath the thrones. A tiny Raj Kuma was in readiness to be Lady Hardinge's page. When he was brought to the front she petted him and made him sit near her. Again the Band played, 'God Save the King', again every one stood up. This time the Emperor and the Empress came. Several Indian princes acted as their pages, and advanced with them holding their gorgeous trains. After they had taken their seats on the thrones, the princes sat on the steps. It was as if the scene had risen in a theatre. This time the Emperor and the Empress wore crowns on their heads. They looked exactly like the Kings and Queens one sees on cards, in story-books and in English fairy tales pictures. Had the King and Queen of England really come all the way from England across so many seas and rivers, hills and deserts? Had they really come to India, to Delhi, to hold a Durbar? Those whose doings and goings and comings to and from Windsor Castle, the Houses of Parliament or the big towns of Europe, were chronicled in the newspapers, were they actually sitting in the flesh to-day before the eyes of their Indian subjects? There, only a short way off, can still be seen the ruins of *Indraprastha*, where Emperor Yudhishtira was once Lord over all, and performed the King-Conquering Sacrifice with Empress Draupadi by his side; where Prithvi Raj also reigned once upon a time with Rani Sanjukta beside him. The relics of Moghal Emperors and Empresses exist there beside them. To-day the British Emperor is performing the King Conquering Sacrifice with the Empress by his side in that same *Indraprastha*, in the heart of that same Delhi. What a difference between that picture and this! In the older day there was only the past. To-day the amalgamation and combination of past and present, of East and West present a new play of colour. All these English men and women, present here,—their

very existence was inconceivable in the Durbar of Yudhishtira or Prithvi Rāj or Akbar. And this Durbar of the British King, with hundreds of thousands of Indian people, this would have been beyond one's dreams in the time of any other King George. Today so many English men seated with so many Indians at the Durbar made the Indians realise repeatedly, this King is indeed ours also, not yours alone—had it been so your King would have remained in your country; if you wanted to see Royalty you would have gone there. The King is the King of us Indians; that is why he has come to his peoples' country to show himself to them and to accept his subjects' devotion. The English are only the fellow-subjects of the Indians. Any further galling pretensions they shall no longer admit. Now that they have seen the real, the false shall deceive them no more.

The Delhi Durbar was an object lesson to us of the necessity of a suzerain power over our heads. Before the Durbar, while going the round of hundreds of Indian Rajas' Camps, while visiting and talking to innumerable Rajahs, Ranis, Nawabs and Begums it had seemed to me that India was an immense Gulistan or flower garden with hundreds of flowers blooming in it. I felt the same thing with greater intensity at the Durbar and realised that a head gardener is absolutely necessary for the superintendence of such a vast garden. In a country where there are so many ruling Chiefs, great and small; where there is no unity of creed, caste or colour, where petty jealousies and consequent fighting and quarrelling amongst rulers is inevitable, unless there be fear of punishment from a greater power, in such a country a powerful sovereign is certainly necessary. And if there needs must be a sovereign then it is our duty to gratefully acknowledge the good fortune of having as Emperor over our heads, the King of such a constitutional country as England. There was one annoying experience, however, of the

Indian spectators present at the Durbar. When the great Princes of India went up to the Emperor and saluted one by one, each in a different style, the nearer any one bowed to the ground, the more claps he received from the English spectators as if the standard of loyalty to the King and lowering of one's self were one and the same thing. I think nothing could be more becoming than the way in which the English Governors saluted the Emperor. Loyalty coupled with self-esteem, that is expressed in the Military salute is the best admixture of manliness and deference. If this is made the common standard of salute for all Indian and English alike, then much misunderstanding and heart-burning would be avoided on both sides.

When the Rajahs had finished paying their homage, the curtain was lifted on the second act. It disclosed the Emperor standing up and holding a paper in his hand ready to read aloud its contents while the Empress stood beside him silently. No sooner the picturesque sight struck our retina than it developed into vivid pictures the negatives of ages closeted therein. The Queen's presence and silent participation in this day's function was not without its meaning and its message to Hindu India. It brought back the scenes of the past when no sacred or civic function could be completed in Indian life without the participation of the wife as the help-meet and the compeer. In the land where Draupadi and Sanjuktā had to take active parts in their Royal husbands' sacrifices, where a Golden Sita had to be placed by Rama's side in the absence of the real one, for the completion of the ceremony of the *Rajanya*, there, in the bosom of that land without Her Gracious Majesty's presence at this day's function the whole performance would not only have lost its beauty and grace but would have been a failure, a thing incomplete, from the Hindu point of view and a humiliating and demoralising spectacle to the hundreds of Hindu women present behind the

screens. The sight impressed our eyes, but only a few sounds reached our ears. We saw a purport of the speech however in print immediately afterwards. It was giddy! The partition was annulled and the Capital transferred from Calcutta to Delhi. The blood surged in my breast. For a minute the power of speaking to those near me was gone. I felt as if some one had given me heaven with one hand and with the other had fetched me a tight slap in the midst of the assembly. Was I glad or sorry? After 30 seconds of hesitation my mind was made up. I braced myself up not to let my face show anything but joy. I said to the English men and English women, to the men and women from Indian Provinces outside Bengal that were besides me, behind me, and in front of me,—“Glory to Bengal! glory to the Emperor! glory to India! Today the King Emperor has acknowledged that the voice of ‘he people is the voice of God, that the feelings of the people are the commands of God. Nothing could be greater for this country than this pronouncement. No subject race has ever had such a grand *Magna Charta*. Today we know we are not slaves, we are free, ours is a self-governed country, and King George is the Emperor of that Swara!”

“And the stealing of your capital? Wont that do you harm?”—Yes! To a certain extent. But this is altogether another matter. That has no connection with the partition of Bengal. We have won in the Emperor’s Durbar the cause for which we protested, for which we agitated. The peoples’ victory over the bureaucracy, that is the thing we must now attend to. And what if Delhi be the capital? Delhi really has long established rights to that. If, by Delhi’s becoming the capital the surrounding inhabitants are likely to advance, if they become quick at everything like the Bengalis, why, then the Bengalis will be pleased. The Bengalis will not fall because of the transfer of the capital, they will not slip from the

heights to which they have risen, but will rise higher still and higher.”

The Emperor and the Empress then descended from that *dais* and walked up to the other. Now they sat on their thrones with their backs to us, and their faces towards the thousands and thousands of their subjects on the mound. The King-Emperor remained silent while the King’s command was proclaimed all around with trumpet-blast. During this interval the English folks began to take out witches, biscuits, chocolates, cakes, &c from paper-boxes or bags or pockets and eat them. Shortly afterwards, the Emperor prepared to leave. The drama was drawing nigh to the close. Again the princes bore their trains, and in a slow and stately manner the Emperor and the Empress stepped into their carriage. Bursts of clappings and cheerings succeeded, and again the band played, “God Save the King.”

For how many years have we, the Indian subjects, been hearing and learning and singing this “God Save the King”. But hitherto it had only been an allegory, a lifeless custom, a mere dry formality one was obliged to go through at the end of every public function. But today how vivid it had become, how living, how real. Today it held a true significance in its every word, its every line. The Band played “God Save Our Gracious King”. And our minds echoed, “Oh Lord, Oh thou who guidest the fate of India, save this great-hearted King, who grants his peoples’ prayers and consults his people’s wishes.”

“LONG LIVE THE NOBLE KING,

Vouchsafe long life to this good and great King.

Send him victorious happy and glorious.

Long to reign over us”.

Give him victory, glory and happiness and bring him back again to us. May he live to reign over us a hundred years!

GOD SAVE THE KING.

Oh! May he return safe and unhurt, he who has come all this way to pour balm on our wounded hearts, may no secret evil-seeking haunt his path.

GOD SAVE THE KING.

May God preserve him.

For the first time listening to the prayer of the band, a trembling foreboding fear for the King's safety entered my heart and tears came uncalled to the eyes.

The Emperor's carriage disappeared from sight. The curtain dropped over the magic play. Ah, no, one more scene remained. The carriage of Lord and Lady Hardinge came round. They both bowed and smiled pleasantly to right and left and thus disappeared. As a representative of the King the band struck up "God Save the King", for Lord Hardinge also. That music recalled to me—true enough, who was it that had thus fulfilled the heart's desire of the people? Was it not this Viceroy, the representative of the Emperor? Every footstep of the path he had trodden in this Indian Kingdom was marked by sympathy with the people. It was by his advice, his initiative and his efforts that the voice of the people had been admitted today to be the voice of God. May God save him, May God grant him a long life with his benign wife. Oh Lord, may such a Viceroy, be long ruling over us!

In the concluding words of the Sanskrit playwright, now if I have any further wishes to add it is this—"May the cows give milk, may the earth abound with harvest, may the clouds pour forth rain in due season, may the sweet winds blow, bringing gladness to the heart of all mankind. May the Brahmans always perform the prescribed holy rites, may good men prosper, and may the King, righteous and with passions under control, protect the earth."*

* The Hero and Nymph.

"Is there ought else the aim of my desires?"—

"My only wish is now the sovereign's glory,
Long graced by virtue, and beloved by friends
Of eminent faith and merit, may he guard
From harm this nurse of elemental life.
Now harassed by barbarians, India repairs
For refuge to the bosom of true royalty,
So to escape second annihilation.

As erst, by strength divine upstaid, she rode
Safe on the tusks of that celestial boar,
Who matched her from the o'erincumbent floods,
And reared her green hills once again to heaven,"†

† *Mudra Rakshasa*—Translated from the original Sanskrit by Professor Wilson.

ALL ABOUT DELHI

AN EXHAUSTIVE HAND-BOOK

Compiled from Authentic Sources.

With 86 Illustrations.

[COMPILED FROM VARIOUS AUTHENTIC SOURCES]

Contents.—The Hindu Kings; Early Muhammadan Kings; The Moghul Emperors; Modern Delhi; Some Delhi Sights; Monuments at Delhi; The Storming of Delhi; The City Gazetteer; Lord Lytton's Durbar; Lord Curzon's Durbar; The King's Durbar of 1911.

In the preparation of this book free use has been made of Mr. Fanshawe's *Delhi: Past and Present*, more especially in the compilation of its last Chapter; of Dr. Fergusson's *Eastern and Indian Architecture* in the description of its great architectural glories; of the revised *Imperial Gazetteer* for the latest statistics relating to the city; of Captain Trotter's *Nicholson's* description of the storming of Delhi; and of Mr. Reynold-Ball's *Tourist's India* for a succinct account of its far-famed Mughal Sites. Besides the standard writers on Indian History and the accounts of European and other travellers to India during the Moghul period, much interesting information has been gleaned from Mr. Abbott's *Through India with the Prince*, Mr. Percival Landon's *Under the Sun*, Mr. G. W. Steevens' *In India*, Genl. Gough's *Old Memories*, and Mr. Kerr's *From Charing Cross to Delhi*.

With thirty-six Illustrations.

G. A. Natesan & Co., Sankaranna Chetty Street, Madras.

REMARKABLE JOURNALISTIC "FUTURISM."

BY

Mr. LEOPOLD KATSCHER.

IN his eccentric but very clever "Anticipations," Mr. H. G. Wells, that famous compound of Bellamy, Jules Verne and—Wells makes some highly interesting remarks on what he thinks will be the Press of the future or the future of the Press. To begin with, he considers it impossible for a newspaper of wide circulation to be sound in its opinions. As soon as it attempts to forsake the favourite clap traps to pass to "some implication of principles and beliefs, directly it chooses and selects" it gets out of touch "with the grey indefiniteness of the general mind, it gives offence here, it perplexes and bores there." In this circumstance Mr. Wells sees the limit of the power of the modern newspaper of large circulation, as well as its limit of power in the future. "It may undergo many remarkable developments and modifications, but none of these will tend to give it any greater political importance than it has now."

With regard to these "developments and modifications" Mr. Wells goes into fanciful details. He dreams of dailies with enormous wide world circulations and almost hourly editions "that will follow the sun and change into to-morrow's issue as they go, picking up literary criticism here, financial intelligence there, here to-morrow's story and there to-morrow's scandal and, like some vast intellectual garden roller, rolling out provincialisms at every revolution."

Such papers will arise as soon as the price "of the best writing (for journalistic purposes) rises actually or relatively above the falling cost of long-distance electrical type-setting." There will be world papers the principal text of which will appear simultaneously everywhere, while each local edition would, in addition, have

its own local part and local advertisements. The transmission of illustrations would be effected by telegraph and a much more extensive use of them was likely to be made than at present.

There will not be one world-paper of this sort only—like Moses' serpent after its miraculous struggle—but several, and as the non-provincial segregation of society goes on, these various great papers will take on more and more decided specific characteristics and lose more and more of their local references. They will come to have not only a distinctive type of matter, a distinct method of thought and manner of expression, but distinctive fundamental implications and a distinctive class of writers. This difference in character and tone renders the advent of any Napoleonic master of the newspaper world vastly more improbable than it would otherwise be. These specialising newspapers will, as they find their class, throw out many features that do not belong to that class.

The sham news would be much restricted—e.g. "that forged and inflated stuff made in offices" which takes away the room for more important things—, whereas at present every paper contains a little of everything, too much of some things, too little of others, and treats of everything in an inadequate manner, with very much of useless stuff, because no newspaper is quite sure of the sort of readers it has, probably no daily has yet a distinctive reader.

The fact that many English dailies at times issue, or say they issue, a whole series of editions in one day, has repeatedly called forth the prophecy that hourly editions will shortly be instituted. With respect to this Mr. Wells says:—

As a matter of fact no human being wants that, and very few are so foolish as to think they do. The only kind of news that any sort of people clamour for is financial and betting fluctuations, lottery lists, and examination results, and the elaborated and cheapened telegraphic and telephone systems of the coming days, with tapes (or phonograph to replace them) in every post office, and near every private house, so far from expanding this department, will probably sweep it out of the papers altogether. One will subscribe to a news agency which will wire all the stuff one cares to have so violently fresh, into a phonographic recorder, perhaps, in some convenient corner. There the thing will be in every house, beside the barometer, to hear or ignore.

With this facilitation one edition a day would suffice, and probably in quarto size instead of the present hyper-double folio. According to Mr. Wells the daily press of the near future

Backed by the acknowledged facts of an ever growing circulation, an unlimited capital and a practical monopoly of all the best writers and news-services of the whole world the directors of the simultaneous newspapers could carry all before them. After the fashion of the great commercial Trusts of the United States, they could simply stamp out opposition and rivalry. It would be in their power to give any rival newspaper concern the option of either combining with them, selling out, or facing financial disaster. They would be able to practically force their own journal upon any city or district. They would hold the newspaper monopoly of the land.

Lord Northcliffe explicitly states that he is not less than a partisan of rings and monopolies, but he considers them unavoidable and would therefore bring out their best side through the exploitation of their advantages. One of the bright sides would be that, in consequence of their extensive service of news and their control of the market, the editors would be able to omit all the superfluous, worthless, commonplace local news which now fills a great part of every newspaper and the insertion of which is quite purposeless and meaningless. Such a boycott would be very praiseworthy and should considerably assist in raising the intellectual level of the reader. But in his extraordinary optimism our "newspaper king" seems to forget that their great power might be a source of temptation to the editors to boycott at times, for private or business reasons, not only the bad but also the good. Herein lies the chief danger of his attractive dream. On his eyes ring papers have only advantages and he closes with the words:

Such a newspaper could maintain a high literary tone, and thus become an educative institution of the greatest value. This is true already of the best journals in most lands. The existence of a gutter Press cannot altogether be ignored. ... Neither can we afford to neglect the fact that a considerable section of the public patronises it. The new regime of journalism will promptly put an end to it. ... Imagine, then, the influence which would be exerted if an overwhelming majority of the newspapers in the U S spoke with the same voice, supported the same principles and enunciated the same policy! Such a state of things would be a terror to evil-doers and to the supporters of anything inimical to the commonwealth.

The Harmsworthian dream, as we have seen, brings out several idealistic traits, but this is done to a much greater extent by the "futurist" ideas

of W. T. Stead, by far the most extensive writer on the subject. His "Twice two are four"—long entirely out of print—was wholly devoted to the fascinating plan of a new-fangled "newspaper as a social centre," entitled *The Daily Paper*, a scheme which, as is well known, he tried to carry into effect many years afterwards, but without success, under that very same title. In that old book he set forth at great length what "a newspaper might be" and "what part it should play in modern society." But the most characteristic exposition of his press ideals is to be found in his highly attractive Annual for 1900—"£40,000,000, Mr. Carnegie's Conundrum." There he outlines the prospectus of an imaginary paper which he entitles *The Week End*.

It will combat as the common enemy all that breeds distrust, whether of nationality or of sect, and will constantly seek to promote the growth of a hearty brotherly comradeship among all the citizens. Its great and ever present ideal will be such a transformation of the conditions of life that no one's child in the poorest district of the city will be doomed to miseries, temptations, and words which we should regard as intolerable for our own children. The "Week End" will endeavour to give every week a summary and a survey of all that has been published during the week relating to the improvement of the city. It will have special features of its own in the shape of short tales, stories from real life, ballads based upon the events of the week, character sketches of leading citizens, and other articles which will enable the reader to understand the inner human and therefore divine element that underlies the dry and uninviting discussion of public questions. To stimulate public interest in all questions of the welfare of the city, prizes will be offered every week for contributions bearing upon the improvement of the conditions of life.

So far from being the rival of any existing periodical, the *Week End* hopes to become the supplement or auxiliary of all, and will rejoice if it is able to co-operate with each of them in helping to realise the great aim of all in making London the ideal city of the world.

Mr. Stead was rightly of the opinion that in order to fulfil its purpose this useful paper should have an enormous circulation, whether by way of subscribers or by regular, free distribution at the expense of some rich philanthropist. In the above-named work, that treats of the different ways in which Mr. Andrew Carnegie could best carry out his intention to give his money away for philanthropic purposes, Stead devotes a whole

chapter to his ideals for future journalism, and appeals to the "steel king's" well-known generosity where things educational are concerned, that he should create a "Newspaper Foundation" issuing three papers: a large, modern, rejuvenated "Times" at 2d, a smaller popular daily at 1d. and a free paper to be called "The Daily Visitor." He wishes above all to counteract the prevalent tendency of the press to pander to the ignoble passion, in the interests of the public. "Others, among whom I should be inclined to enroll myself, plead that it is perfectly possible to make a paper pay even if it is not run on the principle that everybody is dying to know the result of the latest horse-race, or to be distracted by sensational rumours which are printed only to be contradicted." By means of a clear-sighted, serious paper after the style of the *Times*, but written more brightly and interestingly than the venerable model, a moral influence could be exercised upon the ruling classes, the "upper twenty or thirty thousand." The cheaper paper would be for the masses, who are to be won over by it to everything good and beautiful. The third paper, which would have the widest circulation, as Mr. Stead suggests that it should be sent to every family free of charge, would subsist solely upon its advertisements. The advertisements are to be localized according to districts, as is already the case with several widely-circulated Berlin dailies. "Nor would it be impossible to combine with the free system of distribution a system by which great stores might well enter into a profitable partnership with the newspaper. . . . Even if the free paper did nothing else it would always advertise the halfpenny paper and the twopenny *Times*. As all the distributors would be available as amateur reporters, there might be good journalistic profit made out of it." Not a bad idea!

The three endowed papers ought to be backed, and thus rendered entirely independent, by a large "guarantee fund." To Mr. Stead's mind,

they would form the nucleus of a "network of newspapers" covering the whole country, as they would be in a position to maintain a special service of news that could be made to benefit many "affiliated" provincial and even foreign papers throughout the world, in fact, all such as were prepared to follow the example of the endowed dailies in serving the cause of progress and brotherhood. "It would begin in a small way with an interchange of special telegrams and the sharing of special news with selected papers in the provinces, in Europe, and America; it might develop until the news monopoly of the world, now held by Reuter and the Associated Press, would disappear."

The ethical scope and value of the triple paper he sees in the circumstance that it affords "the best people in the community an opportunity to reach the worst" and to "influence the most influential." Certainly there should be no stinting with money. Stead rightly thinks that "nothing can be a worse policy than to stint a newspaper. The best journalistic achievements are spoiled by the niggard policy which wrecks the ship for the sake of a ha'p'orth of tar."

Let me conclude with a very curious and almost unknown newspaper scheme which sprang from Mr. Stead's fertile brain about a quarter of a century ago. At that time he strongly urged Alexander III. to establish a daily which would be "eyes and ears" for the Tsar. The Russian Government having great objection in those days to anything approaching a Parliament, the then Editor of the *Pall Mall Gazette* suggested as an alternative that the Emperor should depute one of the most trusted and intelligent of his cabinet ministers to edit a paper for the double purpose of disseminating the ideas of the Tsar throughout the Empire and of affording his subjects an opportunity of publishing statements of their grievances. Stead proposed that certain categories of persons—such as the repre-

representatives of municipalities, Zemestros, universities, peasants' unions, etc.,—should obtain the right to have published in the Imperial news paper, within reasonable limits, the complaints and representations they wished to make to the Emperor; and the editor was not to be allowed to suppress any petition from any of the qualified categories, unless the Emperor would declare in writing that the suppressed document had been submitted to, and read by him. As a matter of course this very Utopian scheme, though meeting with feigned approval, was never carried out, nor could it have been.

THE SORROWS OF A LIFE.

BY

SWARNAKUMARI GHOSAL.

I.

O, I am not in love with her. It is impossible, a man who has loved once cannot love again. I may be foud of Mrinalini Devi, I like to see her face, to speak with her, to hear her voice. But it is all easily explained. I love her with that love that one bears a friend. My reader may misjudge me after hearing my tale, as I have myself had some suspicions about my own feeling. But no, I come ever to the same conclusion, a heart that has once known love, will never know it again.

I am a physician and have met the lady in my professional capacity and by a strange coincidence, it seemed I was travelling in the interior and came upon one of those little villages that are numerous in Berhal and which consist mainly of a dozen mud huts and two or three villas that serve as country residences for the wealthier people.

I was weary and rested by the river side alone when a servant came up to me and to my great surprise asked me,

"Are you a doctor, Sir? My mistress is ill and requires your service."

And so we met and became friends in a short time.

But stranger still it seemed that from the very beginning the touch of her hand, her voice, her smile—these things filled me with fond secretaries,

still let no one suspect that this is due to any serious case. She strangely calls to mind one whom once I knew. When the light of her eyes is upon me, I see the look of another, one I knew in days of yore. I hear the sound of another's voice in hers; the touch of her hand is the touch of another. It is owing to this that I find myself enraptured while gazing at her, while holding her hand in mine.

Now my fair reader is smiling conspicuously. "Yea, yea, men will find themselves in that perplexity," I hear you say, "You men never tire of the fragrance of the flower of love, but you make it suit your convenience, and when need be resort to analysis. Is this a bud or a full blown flower?" you say.

It may be as you say, my fair Critic, but this notwithstanding, I know the difference between a bud and a full blown rose. And because I knew, I say this feeling of mine is not love but friendship, a delicate, tender yet firmly rooted friendship, a rare boon granted by the gods to mortals. A friendship such as this is possible only between man and woman. Between man and man it could not exist. Could a man unlock his heart and disclose its saddest and most tender secrets, could he lift the veil from his soul and open the deepest chapters of his life before another man, and expect a tear of sympathy in return? This would seem ridiculous. No, it requires the tender sympathy of a woman to do all this. Was it then possible for me to refrain from telling her all?

It was the hour of twilight, we were alone, the room was dimly lighted. The gaze of her beautiful eyes was on my face and with a sigh she asked:

"Whether are your thoughts wandering? I see the shadow of a great sorrow on your face. It would seem there is anguish in your heart."

I do not know whether another could have resisted this pleading voice, but it was impossible for me. I felt my eyes filling with tears as I cried out: "May God never ordain such suffering as mine to any other human soul."

Through the mist of my tears I beheld the slender form beside me. Ah, if there were the spirit of early youth in this gravity, if the sadness of her eyes were replaced by that bright, gay look, if her cheek had been less wan, her form a little more girlish, how beautiful she would have been. She would then no more have seemed like a mere counterpart of her I cherish, but herself indeed.

I heard a sigh escaping those tender lips. This roused me from my reverie. "Have my words pained you?" I asked.

She replied not. The dusk did not permit me to see her face clearly, but I thought I saw tears in her lashes. "What is it that worries you?" Still Mizalini did not speak.

I urged her to explain "Are you ill? You are so strangely silent."

"I had thought I was not such an utter stranger to you." Her voice was low and oh, so sad.

The cause of her anxiety made me smile. "Is this all that worries you? And why have you come to this conclusion?"

"Because I see you are unable to trust me."

"Unable to trust you? What other friend have I whom I can trust so well."

"And still you refuse to make me the partaker of your sorrow."

Her words made me reflect. I could not answer her immediately. "Sister," my heart was heavy when I spoke, "You wrong me with your suspicions. I have none other in the world whom I could take into the secrets of my heart. And if I hesitate to tell you all, it is because I wish not to pain you. Remember the story of my life is sad, very sad." And, now I addressed her with familiar "thou," and called her "dearest sister," it seemed so natural, I but followed the dictates of my heart.

"And if it pained me," replied the same sweet voice, "would not that pain find its compensation in the consciousness of being worthy of the confidence of a friend. What greater happiness is there than that of being trusted all in all?"

"Sister, you have spoken well, you follow the dictates of a true heart, your impulse is noble and has led you aright. If I have doubted, if in my mind I have not trusted you entirely, it is because I did not direct my thoughts aright, because I listened not to the voice of the soul. Yes, if I could have trusted, could have laid bare this heart of mine, to one who would understand, I might have found relief from this great pain ere this, listen then. Sister, and you shall hear the story of my great sorrow, since to her I can tell it no more who should have heard it. And by telling all to you I might expiate a shameful deed, that I could not confess to her for very shame if indeed expiation were possible. Hear me then, and you will know how undeserving of your confidence is this wretched man, still how implicitly he trusts you."

II.

"On my return from England I spent a few days in my native place with friends and relatives, and then came back to Calcutta. There

were but a few weeks left before I was to join my post as Indian Medical Sergeant under Government, and there I spent in the house of a friend and castellan of mine, between whose family and ours there existed a friendship of many years standing. He was a pleader of the High Court and had amassed great wealth. But his life was lonely, his wife was dead, and there was no one to enjoy his fortune but his daughter, his only child, the joy of his heart.

Pran Krishna Babu had never been abroad, still his habits were not conservative. His daughter had received advanced education and had not as yet been given in marriage.

I had heard that Mayabini was ill. She was subject to a strange disease, a hysteria peculiar in itself. She would fall into fainting fits, which were, however, not attended by struggles or any of her violent symptoms. Still she would be apparently unconscious for twenty-four hours. At such times she seemed like one in a deep sleep; but from what she said, it soon became clear that she heard and felt all that went on around her; her eyes being closed, however, she could not see. After having lain thus for twenty-four hours she gradually recovered, but it was three or four days before she regained her old strength.

The disease showed a strange symptom in the fact that it appeared without any warning. The patient could apparently not explain the cause that brought on these attacks, but it was my opinion that she knew and would not tell.

She had had one of these fainting attacks a few days prior to my arrival in the house. When therefore I saw her for the first time she was still in bed. Her father spoke to me of his daughter's ailment and wished that I should see her. I then called to mind the picture of a little girl, slender, romping with dishevelled tresses, with careless dress, a restless eye, seldom quiet on her feet for a minute, and never tiring, chattering tongue.

According to his wish I accompanied Pran Krishna Babu to Maya's room, still expecting to see the mischievous, romping girl I had left five years ago. How great was my surprise when on entering the chamber I saw Mayabini as she was.

Half reclining on a couch lay a young lady, daintily dressed in a white robe, her ringlets falling on her brow; her hair which was twisted in a knot revealed a beautiful neck. She was of that exquisite age where girlhood and womanhood meet. Her unconstrained youthful manner, her frank, cheerful and ever tender smile—these linger

in my memory still and will remain there for ever. The unexpected vision of loveliness awed me. Was this the patient? There was not a sign of disease visible in her save a soft pallor of the face, which only heightened its charm. She held a half-blown rose in her hand of which she was inhaling the fragrance. She was calm and self-possessed and greeted me smilingly while she put the flower on a table beside her.

"I am very pleased to see you, Dr. Das," she said, "you are not changed at all. But for the change in your dress, you look as you did five years ago," and she extended her hand in welcome.

The feeble tremor in her voice enhanced her delicate charm. I could not reply. I could not trust my eyes. Was this "Maya," or was it a delusion? Her father drew a chair near the couch and asked me to be seated, while he took a seat near the window and commenced reading the newspaper. I had not as yet said a word and now began to feel that I must appear awkward in the young lady's eye. "You seem to be still weak, Madame?" I ventured to ask after a short reflection.

A smile passed over her sweet young face. "So I have grown to be 'Madame' in these few years. You are evidently affected by English etiquette."

Her curt remark put me out somewhat. "You were such a mite when I left you, I could not quite realize that you were the same little girl."

"But I had not forgotten you. I see that a short memory is the characteristic of men."

Her voice was very low. Perhaps she did not wish that her father should hear her, but the gentleman was so absorbed in the latest news, he seemed not to be aware of us.

Her words pleased me, they touched my heart. "Maya, you are still as mischievous as ever, or worse if possible. Who can withstand your invincible tongue? If I recall the little girl of five years ago, is not that sufficient proof that I have not forgotten you?"

"I am very glad to receive this proof of your remembering me. But now tell me some of your experience in England."

"There will be time enough for that presently. First let me hear about your illness. I understand that even at the moment one of these attacks comes upon you, you cannot tell that it is coming."

"No."

"Nor are you able to understand the cause that brings them on,—whether it be irregularity in

diet, or too much talking or reading or what else it may be?"

I was not permitted to ask any further questions. Maya interrupted me abruptly. "You are a physician, it is for you to find out all this. I cannot be expected to know what brings on attacks of illness. Don't waste time in idle questions but tell me of England; it will entertain me, and I shall feel better."

From this I concluded that she wished to evade the question. However I might probe the matter later on; it would be better left alone for the present, so I complied with her request. "England? It is a paradise. Once there one does not wish to go away again."

"It is a pity then you have had to come back. I suppose you left half of yourself behind?"

"I should have had no objection to leaving the whole man there, but that no one cared to encumber herself with the burden."

So far Mrinalini had listened to my narrative without interrupting, but now she broke the silence. "That was very generous indeed," she suddenly exclaimed. How strange her words sounded, they were the same that Maya had said on the day of our first conversation. I became confounded and looked in surprise at Mrinalini's face. "And what happened next?" was all she calmly asked.

There was little for me to say. I had lost the thread of my discourse. "Nothing of any consequence," I replied.

"By that time her father had finished his paper and he and I left the room."

"Leaving, of course, your heart behind."

"I do not believe in love at first sight, or I should say yes."

"But it does not appear that you required a long experience to make you believe it."

"I cannot deny it; I now feel ashamed of it, but I did not at the time feel ashamed to ask Maya's hand in marriage of her father. This I did ere a week had elapsed. But oh, the horror of that day. With the curse of it on my head, with the fire of a lost hope burning within me, must I thus spend the remainder of my life? I learnt that day that Maya would never be mine, that she was promised to another and that her marriage had been postponed only on account of her illness. I heard my reply and was overcome by despair. But the pain that now gnaws at the soul of my being is not caused then. There are among men many who have to overcome the pangs of a lost love; those wounds may heal; man will brace up in time and forget. The suffering of my life—"

I could speak no further. Mrinalini tenderly took my hand in hers and dropped her lashes. I felt her tears on my hand "Sister, let my story end here, you will not be able to hear more." This was all I could falter. Her voice trembled as she softly replied, "Continue, I am strong enough to hear the end. Only prove that you trust me."

"Listen then, and you shall hear all. The house of my host was a large, comfortable building. There was a large drawing-room in the centre, adjoining which on either side were two rooms. Those on one side were occupied by Mayabini and her father; of the other two one was the dining-room and the other the guest-chamber.

And now my mind recalls that sad day when my offer to marry Mayabini had been rejected. I did not see her that entire day. I should have entered her room for a while perhaps in the afternoon, but learnt that her fiancé was with her. I had only on that day found out that she was betrothed to Sashi Babu, although I had met the young gentleman several days at the house. That evening Maya did not join us at dinner. This was not unusual, however, since she had her dinner served in her room frequently. After retiring to the drawing-room our host soon made himself comfortable on a couch and fell into a doze, after having had his smoking apparatus placed at a convenient distance. I noticed that Sashi Babu looked very sad, which I could not understand at the time, for he seemed to me like the most fortunate of men. He took up a violin and began to tune it, while I stood by the window and gazed into the moonlit scene before me. Oh, the solemn beauty of the oriental night! Winter was just over, and the young year had come with all its delicate charms. The trees, the shadows, nay the very moonlight itself seemed to tremble and then, was it the voice of magic that called from the palpitating bosom of the night? With a heart-rending wail the violin sent forth its notes until the still night seemed agitated with a deep emotion. I had not been so dejected even at the moment when I had heard my fatal verdict that morning. Then I felt like one struck dumb, my feelings seemed partially paralyzed.

But now the tune of that violin awoke the torment of despair in every nerve. My heart sobbed with every note, as it wailed its doleful message to the world. "She is not mine, she is not mine," echoed back my bleeding heart, life is a desert, a long, cold, death.

I was like one distracted. I could not endure that wail any longer, I left the room hastily.

Passing Maya's chamber I saw the door ajar. Mad with anguish I rushed inside and found her lying on a couch near the window. I stood beside her. How beautiful it was that sleeping face while the moonlight cast its halo around it! I gazed and forgot everything. I no longer realized that she was not mine. Overcome by her beauty, I embraced that sleeping form and kissed her again and again with passionate fondness."

Mrinalini became suddenly excited—"Like a thief, you then her voice choked."

"Yes, it was I who committed so shameful a deed. Hate me, if you must. But remember that I am after all but a frail mortal. Perhaps I might do so again, if similarly placed, who knows. But see the punishment, at which even the most unforgiving heart would melt. Believe me I have suffered for my sin." "Go on" was all her weeping voice replied.

"The next morning her father told me that his daughter had again been in a deep faint since evening. Oh the shame I felt and the remorse at my conduct. But shame and remorse alike were vain. I could never have the courage to confess and ask her forgiveness. Maya got well, however, in the course of three or four days.

Meanwhile I noticed a change in her father. The gentleman seemed worried. He looked like one who had something in his mind of which it was difficult to speak. I was not left in the dark long, however. One afternoon, while we were alone, he suddenly broke the ice.

"Are you still prepared to marry Maya?" he put the question somewhat abruptly.

You may well imagine my surprise. My first thought was her unfortunate betrothed.

"But Sashi Babu?" I asked eagerly.

Pran Krishna Babu looked annoyed, there was an angry ring in his voice when he replied.

"Sashi tells me that he had not so far consulted his parents about the marriage. Having done so now he finds they object. He is therefore unwilling to marry."

I need hardly say that I felt the joy of the elect in heaven. A few days more, and Mayabini and I were married."

III.

I stopped in my narrative. But Mrinalini was evidently impatient. She urged me to continue.

"What happened next?" she questioned eagerly.

"What happened next? How true it is that there is no happiness in this world. I now had her whom I so deeply longed to possess, whose presence had seemed to me the greatest thing under the sun, and yet I was not happy.

There was only a week remaining before I was to join my post. We were spending those days in the garden house on the banks of the Ganges. Nature was beautiful in this place. But the beauties of Nature have no delight for the heart that knows not happiness. Maya had lost her cheerfulness, she was always sad. My caresses might banish her sad moods for a time, but only to have them return with greater intensity. I often saw her eyes filled with tears, while she silently turned from me. When she noticed that this pained me, she endeavoured to speak, but seemed unable to tell us what was in her heart. What could I think but that the still loved Sashi I suffered the torments of hell.

It was a beautiful moonlight night when we were seated together by the river bank. The full moon illumined the sky and reflected her trembling image in the waters below. How enchanting was the scene, a thousand beams sparkled on the waters which flowed along like a mass of molten silver and deepened the shadows on either side. It seemed that the darkness that dwelt in our hearts had assumed a deeper tinge by the contact with this scene. Suddenly there came the sound of a violin from the bosom of the still stream. Maya startled and turned her head away. Her voice gave signs of a great emotion when she said "That evening I heard the same tune. It is he."

"It is who?"

"Sashi Babu. That tune overpowered me. I could not help it—I fell into a swoon. I have endeavoured many times to tell you this, but could not. Forgive me."

"Then I knew to what she referred. Remorse overpowered me, and yet I could not prevail on myself to tell her that the villain who had committed the deed was not Sashi Babu but I. Shame sealed my lips. She spoke again, 'That afternoon I had told Sashi Babu that I could not marry him, because I loved you. He left me without a word. I felt very sorry for him, but I cursed myself and wept. Then when the veil of his violin expressed the sadness of his heart, I felt as if my own heart would break. Soon after I fainted. I had wept bitter tears for him, but in return the shameless man touched me, while I lay in a hopeless state. Forgive me, for you see it was no fault of mine. It is you whom I love.'"

My heart was touched to its very depth. I tried to gather courage with all the strength I possessed at that moment, and taking her hand in mine, was ready to utter these words, "That villain was

not Sashi Babu but I." But these words remained unsaid for ever. Maya fainted suddenly and fell into the water at our feet. For a minute I stood like one struck dumb and then plunged in after. But———"

My strength failed me: Mrinalini weeping by my side roused me. "Do you not know me?" came her faint whisper, "I am not dead, as you supposed me to be. Oh, why did you not say these words then as you are saying them now?"

And now I realised all, the scales fell from my eyes. Yes, this was Maya, Maya whom I had mourned as dead.

"Yes, I am Maya" came her soft sweet voice, "you did not know me, but I saw you by the river side and from the distance knew you at once."

"And why did you not tell me this sooner?"

Maya smiled through her tears and said "I wished to see whether you would love me without knowing me."

"You are the same mischievous girl, I see, as mischievous as ever."

"Oh, the miserable life I have led during these five years" Maya said sadly "I recovered, but why, oh, why was I saved? Why did Sashi Babu rescue me from the river? But where were you all these years?"

"Where was I? The shock had been too great for me. When I recovered my senses I found I was in a hospital for nervous patients. How I was rescued, who rescued me, how I came into the hospital, of all these things I know nothing. My mind was a complete blank until a month ago, then my lost memory returned. But of my life from the moment I leaped into the water after you, I still know nothing to this day."

I saw the sweet sadness in Maya's face, I saw the tears that filled her eyes. "Ever since my recovery I have searched for you," I continued, "from Calcutta I went to Dacca, and from there I returned to Calcutta, and went to the garden-house where we were so cruelly separated, and at last when hope had forsaken me, tired and weary, I came to rest in this strange place, and here I found you. How came you here?"

Her voice was feeble when she told me of her father's death and how she had silently retreated to this quiet place to live with a maternal aunt, having rented the family residence to strangers.

Clasped in each other's arms, we know there was no longer any secret between us. The dark past was forgotten at last.

DEWAN C. RANGACHARLU.

DEWAN C. RANGACHARLU.

BY

MR. D. V. GUNDAPPA.

EARLY LIFE.

A man of the people in origin, habit, interest and sympathy" was Cettipuniam Veeravalli Rangacharlu. He was born in 1831,—the year in which the British took possession of Mysore deposing the Maharaja,—in a village in the Chingleput District, Madras Presidency; and if intelligent and respectable parentage is a fortune, he was fortunate. His father Raghavacharlu, a Sri Vaishnava Brahmin of the middle class, was a clerk in the Collectorate of that district. Among his close connections who won distinction in life may be mentioned the late Mr. Vembakkum Rama Iyengar and Sir V. Bhashyam Iyengar. His father was keenly alive to the benefits of English education and was therefore anxious to send him to Madras; but his income being modest, his ambition seemed almost impossible of attainment until, by the death of a relative, he got, it is said, *a considerable sum of money* and Rangacharlu secured, besides, the patronage of Mr. Raghavachariar, the first Indian Magistrate in Madras. Rangacharlu's youth was marked by an unusual degree of precociousness. He was diligent in his studies, distinguished in his class and loved by his teachers. He came under the influence of Mr. E. B. Powell, one of the pioneers of modern education in Southern India, who obtained him a scholarship; and took the Certificate of Proficiency in 1849.

Education being over, he successfully passed the Public Service Examination and took up service as a clerk under Mr. Ellis, Collector of Madras. After some time, he was transferred to Chingleput and then to Salem. Experience in the lower ranks of office gave him a deep insight into all the details of Revenue administration; and the corrupt practices prevalent therein excited his moral indignation. Then came out, in 1856, that bold and outspoken paper "On Bribery" which might well be taken as

the first manifestation of his popular fibre and popular sympathies. Among those whom it attacked were, it appears, some of his own kith and kin; every page of it bears testimony to his deep-seated suspicion of red-tapism. It set forth (1) inadequate pay of the native servants, (2) insufficiency of a superior educated and moral agency, (3) imperfections of the Revenue system, and (4) errors of the administrative officers, as the causes of official malpractices and also suggested some remedial measures. It put forth a plea for the formation of popular assemblies in all important towns and for the starting of a "native paper" to voice forth public opinion, disseminate correct notions regarding the nature of the British Government and check the irregularities of public servants. The pamphlet was at first intended for private circulation, but was after two years given to the public under the pseudonym of "A Native Revenue Officer," at the instance of "a gentleman who is deeply interested in the intellectual, moral and social improvement of the native inhabitants,"—probably Mr. G. N. Taylor.

From Salem he was sent to Saidapet as Tahsildar and thence to Nellore as District Sheristadar. In 1859 Mr. Taylor, President of the Inam Commission and afterwards of the Railway Commission, selected Rangacharlu as his special Assistant. In this capacity, he crossed the sea on an official journey to Calcutta, along with Mr. Taylor, laying aside the objections of his relatives and co-religionists. This shows that he was imbued with liberal views in social matters also. His "excellent judgment" and "wonderful capacity" were of great service to Mr. Taylor; and when the latter became, later on, member of the Viceroy's Council for Madras, he used to consult his old colleague on all points of importance and quote his opinions in the debates. In 1864, Rangacharlu was appointed the Deputy Collector of Treasury at Calicut.

IN A KING'S TREASURY.

It will be remembered that in 1831 Maharaja Sri Mumtaz Ali Krishna Raja Wodeyar Bahadur, G.C.S.I. of Mysore was dethroned on account of alleged maladministration. But the

stout-hearted Maharaja pleaded "not guilty," and kept on petitioning and vigorously agitating through an expensive agency in England for 36 long and weary years, in order to redeem himself from the unwarrantable dishonour and be restored to his rightful position. At last, in a despatch dated 16th April 1867, the Secretary of State communicated to the Government of India that "Her Majesty desires to maintain that (the Maharaja's) family on the throne in the person of His Highness' adopted son upon terms corresponding with those of 1799 If at the demise of His Highness, the young prince should not have attained the age . . . for his majority, the territory shall continue to be governed in his name, upon the same principles and under the same regulations as at the present time."

In the meanwhile, a telegram dated the 28th March 1868, from the Commissioner of Mysore to the Secretary to the Government of India announced: "Maharaja died at 11 o'clock last night. Regiment from French Rocks arrived at Mysore and occupied Fort gates. All is quiet. Valuable property sealed up; and ladies and servants received expression of condolence and assurance of protection." Previous to this, Sir Richard Temple, Secretary to the Government of India, had, hearing of the Maharaja's serious illness, instructed Mr. L. Bowring, Commissioner, that "the young Maharaja should be treated personally as successor to the late Maharaja, and suitable arrangements regarding the palace and the household should be made." Accordingly, the Commissioner reported on the 7th April that he "had an interview with the young Maharaja and the Rani," that "schedules of all property belonging to the late Maharaja have been obtained and a complete inventory will be made," that "considering the laborious nature of the duties entailed, a first-rate native will be required" to assist Major Elliot in scrutinizing the establishments and invoicing the property" and that "the advice of an experienced native would be very useful on such an occasion." On 5th May following Mr. Bowring wrote:—

The Government of Madras have, on my application, been good enough to transfer to me the services of Mr.

Rangachariu, a Deputy Collector of that Presidency, for the purpose of aiding Major Elliot in the laborious duty before him. Mr. Rangachariu served for a long time under the Honble Mr Taylor in the Inam Inquiry of Madras and I have little doubt that that gentleman will testify to his remarkable aptitude for business and his high character. I have no hesitation, therefore, in soliciting the confirmation of Government of his appointment to the post referred to.

On May 23, the Government* sanctioned the appointment on a monthly salary of Rs. 800. About three months after, we find the Commissioner reporting "the successful accomplishment of the reduction and revision of the Palace establishments of the Maharaja of Mysore, a laborious duty which, owing to the judicious arrangements of Major Elliot, the Superintendent, who was ably seconded by Mr. C Rangachariu, has notwithstanding its formidable nature, been performed so as to command the acquiescence of all those concerned in it" Major Elliot himself wrote:—

It is matter of considerable regret to me that I have been compelled by the state of my health to relinquish the charge without for a short time at least having any opportunity of watching the working of the Palace departments under the new regime, I am satisfied that what remains to be done as well as what further explanation may hereafter be required in regard to the past settlements and the principles followed in obtaining them will be readily attended to by Mr. C. Rangachariu to whose value as a public officer I have again, at the close of my labours, to record my testimony and beg to commend him most strongly to the favourable consideration of Government as one eminently qualified to do honour to the highest branches of public service. To his able assistance I have been much indebted throughout the whole of this, in many respects, debate and most fatiguing and intricate inquiry and I am desirous that Mr. Rangachariu should receive the credit which he so justly deserves for the ability, energy and great accuracy in the details. . . .

This was in November 1868. In December next, the Government of India appointed Lieutenant Colonel J. Heines to be guardian to the minor Maharaja of Mysore and suggested to the Commissioner that "it would conduce to good order and management to place under the guardian a highly qualified native gentleman who might be of much use in regulating and controlling the affairs of the household and who might from his knowledge of native habits and character give valuable advice and suggestions to Lieutenant Colonel Heines. Such a qualified person His Excellency in Council believes, is at this moment available in C. Rangachariu. . . ." The

suggestion of course took effect. In 1860, Lieutenant Colonel Heines was succeeded by Lieutenant Colonel G. B. Malleon; and an official paper of August 1871 states:

Associated with Lt. Col. Malleon and now with Mr. Gordon, his successor, in his important work, are Mr. Rangacharlu and Mr. Jayaram Rao. Mr. Rangacharlu had already earned the good opinion of Government by the meritorious assistance which he rendered to Major Charles Elliot.

In 1874, Rangacharlu wrote a characteristic paper on the "Fifty years of British Administration of Mysore" which was published in London and created considerable sensation among the Parliamentary friends of India. It was only a fragment; but as it fearlessly exposed the shortcomings of British rule,—how it was expensive without being adapted to the special circumstances of the Province and how certain individuals were fattening at the cost of the State,—the remaining portion of it was not allowed to see the light of day. A deserved honour in the form of a C.I.E. came to him in 1879, and in the next year Chief Commissioner Mr. Gordon appointed him his Revenue Secretary. About 1880, some baseless slanders were set afloat to the effect that Rangacharlu was a selfish alien and that he was responsible for the alleged disappearance of certain valuables from the Mysore Palace. It was almost inevitable that many should have turned. Rangacharlu's enemies when he was engaged in the onerous task of purifying the Palace and reforming its administration. As many as 6,000 persons who were maintained at a needless expense of Rs. 38,000 a month were, in all, thrown out of employment in the course of his retrenchment. These and the others who were prevented by him from exercising their undesirable influence on the young Prince and the Rani made common cause and employed all sorts of tricks to defame him. There were also some who thought that they had claims of their own for the office of Dewan which was certain to come into existence soon and was likely to be conferred on their rival Rangacharlu. Even some honest and respectable folk were for a time deceived into a belief in the groundless reports circulated by these interested people so much so that popular feeling ran very high against Rangacharlu at one time.

But nothing ever shook the trust that had been reposed in him by the British Government as well as by the young Maharaja and his real well-wishers.

THE DEWAN.

When the long, wearisome and arduous process of making a statesman was thus well-nigh over, Chamarajendra Wodeyar attained the age of majority and was fit to assume the charge of his territories. He was intelligent, noble and patriotic; a careful training, in which Rangacharlu himself had taken no mean part, had developed in him all the graces of conduct requisite in a ruler of men; and the influence of the high-minded Britishers of those days as well as his own peculiar circumstances had instilled into him a profound sense of his exalted duties. In fact, on his worthiness depended the sole chance of success for any one who would become his minister,—especially for Rangacharlu. "The most disastrous famine of which we have any record" had laid the people low, ruined trades and industries and driven the state into heavy indebtedness. Amidst these trying conditions it was that the Government of Mysore was transferred, on March 25, 1881, to His late Highness Sri Chamarajendra Wodeyar Bahadur, G.C.S.I. On the same day, "placing trust and confidence in the loyalty, ability and judgment of C. V. Rangacharlu", he was appointed "to be our Dewan for the conduct of the executive administration of the said territories;" and then was formed also the Maharaja's Council, with the Dewan as President, "to submit for our consideration, their opinion on all questions relating to legislation and taxation and on all other important measures connected with the good administration of our territories and the well-being of our subjects."

Undaunted by private foes and public adversities, Rangacharlu went on with his work of reconstruction. His adamant will and nerve of steel stood him in good stead. He skilfully husbanded the resources of the state, economised expenditure, carried out a convenient redistribution of Taluks and districts, abolished or transferred superfluous courts and offices, substituted natives—parti-

cularly the sons of the soil,—for the Europeans in service, reorganised the several departments of administration, laid down principles and policies for their guidance and, in short, continued the work of administrative reform which he, as Revenue Secretary, had initiated in co-operation with Mr. Gordon. Marks of Rangachari's personality are still clearly visible in the working of every branch of the Mysore Government. A few facts of his administration and a few of his leading economic ideas can be gathered from his own two addresses to the local Representative Assembly, the first delivered on 7th October 1881 and the second on 26th October 1882.

I wish now particularly to dwell on the fact that the ordinary routine of the Administration of the Government is not the only subject which requires our notice. The development of the various industries on which the prosperity of the country is dependent equally demands our consideration, and, His Highness Government will be always prepared to give every attention to any suggestion which may be made upon these subjects. The appointment of a special officer for the purpose cannot be of much service as the experience and knowledge of a single individual can accomplish but little. His Highness the Maharaja is desirous of organizing a large association of private gentlemen who are likely to interest themselves in the matter and when such an association is formed, His Highness Government will consider it to be its duty to help the efforts of the association to promote the industries of the country.

His Highness Government regards the opening out of the province by means of Railways as a preliminary to the development of its resources.

I cannot conclude this address without referring again to what I urged last year—the great importance of the development of the various industries of the Province—though owing to the heavy work of organization which devolved on the Government during the year, it has not been able to accomplish anything in this direction. The association which was proposed for the promotion of science and industry has not yet been formed but I assure you that no further time will be lost in organizing it. I must, however again report that whatever government or any few outsiders can do must be small compared with what the great mass of the population engaged in industrial pursuits could accomplish in their several occupations when stirred up by a desire for advancement. When all the world around is working marvellous progress, the 200 millions of people in this country cannot much longer continue in their long sleep, simply following the traditions of their ancestors of 2,000 years ago and earning a miserable subsistence, ready to be crushed on the first occurrence of a famine or other calamity. Steam began to be utilized in Europe as a motive power in manufactures only at the beginning of the present century. India then used to export cloth to England. Now England, notwithstanding a severe competition from the other countries of Europe and America, supplies the greater portion of the world with cloth and other manu-

factures. These are not the fruits of any large individual discoveries which alone can attract the attention of the official mind, but the result of numerous individual men devoting their intelligence to effect small discoveries and improvements from day to day in their several occupations which in their aggregate produce such marvellous wealth and general prosperity. What then may not be accomplished if the large population in this country once entered on a similar career of progress?

Comment is needless. It only remains to be said that none of Rangachari's successors has spoken to the people in the same winning and sincere tone about their occupations, their needs, their difficulties and their prospects. None has taken them into so intimate a confidence, told them so frankly about the futility of relying for help on the official "birds of passage and of prey" and laid such great emphasis on the necessity for self-help. No one has expended so much earnest thought on their problems, and met them with a head so full of advice, admonition and suggestion. And no one, in short, has endeavoured so persistently and so zealously to raise the intellectual, moral and political status of the ryot—the back-bone of the state. Within the thirty years since Rangachari's death, the receipts and expenditure of the Mysore Government have more than doubled themselves.

THE DEMOCRAT.

A skilful financier and able administrator as Rangachari was, the distinguishing trait of his character was his democratic leaning. In the order announcing the formation of the Representative Assembly dated the 25th August 1881, he has expressly stated: "H. H. The Maharaja is desirous that the views and objects which his Government has in the measures adopted for the administration of the Province should be better known and appreciated by the people for whose benefit they are intended; and he is of opinion that a beginning towards the attainment of this object may be made by an annual meeting of the representative landholders and merchants from all parts of the Province, before whom the Dewan will place the results of the past year's administration and a programme of what is intended to be carried out in the coming year. Such an arrangement by bringing the people in im-

mediate communication with the Government would serve to remove from their minds any misapprehensions in regard to the views and action of the Government and would convince them that *the interests of the Government are identical with those of the people.*"

Many and vehement were the objections raised against Rangacharlu's scheme. It was said that the people were not educated, that they were not accustomed, that they were not prepared, that they were not eager and that they were not fit for representative political institutions. But he heeded them not. He believed that capacity for active participation in politics can be acquired only gradually and only by actually taking part in it for some time, just as swimming can be learnt only by a long practice of that art in water. He was not blind to the existence of certain communal ideas among the people, as evidenced in their ancient institutions such as the *Panchayet*, and he could see nothing intrinsically wrong either with the brain or with the body of the Indian, to render him unfit to make "a beginning" in taking some share in the administration of his country. And like the philosophical Radical of our day, he held that "no Government can be trusted if it is not liable to be called before some jury or another, compose that jury how you will, and even if its majority should unluckily happen to be dunces."

It is perhaps necessary to add here that the Representative Assembly was instituted not only with a view to render the people happier and the State more prosperous, but also to prevent the possibility of a catastrophe such as had befallen the State fifty years ago.

Others there are,—and they are officials,—who maintain that the Representative Assembly was meant to be merely a consultative body, that no responsible powers were ever intended for it, and that it had only favours to solicit but no rights to demand or safeguard. This is a mistake in which they persist to their own convenience. To them Rangacharlu's reply is decisive: "The one great problem to be solved by Indian statesmen is how the people could be roused from

the crushing influence of officialdom and stirred up to industrial enterprise and progress. His Highness' Government is most anxious to do what lies in its humble power, in this direction; but now that a new era of representative institutions and self-government is commencing to infuse new life into the nation, the Government must look to you, as the representatives of the people, to spread these ideas amongst them, and rouse them to a sense of their true interest and importance."

The following extracts from his speech before the Representative Assembly of 1882 contain his opinion on the momentous question of self-government for Indians:

It is gratifying to find that since His Highness the Maharaja initiated this popular measure, the Government of India have resolved upon a comprehensive scheme for extending self-Government in local matters throughout the British Territories in India. Their Despatch of the 8th May, 1882, which contains their orders on the subject, may, from its earnestness of purpose, its liberal views, and far-seeing statesmanship, be truly regarded as introducing a new era in the Indian Administration. The universal satisfaction with which it has been received throughout Southern India, and, I believe, in other parts of India also, is proof of the appreciation of the boon by the people, and refutes the assumption often made that they are not yet prepared for self-government. If the spread of any high degree of education among the great mass of the people were to be insisted upon as a *sine qua non*, we may have to wait for ever, meanwhile every year, under an autocratic system of government, will find the people less fit for representative institutions. The sprinkling of educated men who are sure to be found in these representative bodies will serve for all purposes of leading and guiding; but what is required in the great body of the representatives is common sense and practical views such as characterized your discussions on the occasion of our last meeting, and which are sure to be possessed by men of ordinary knowledge engaged in industrial and other useful occupations. The real education for self-government can only be acquired by the practical exercise of representative functions and responsibilities under the guidance, as observed by the Government of India, of officers possessed of administrative tact and directive energy, and evincing an earnestness in the success of the experiment.

The trend of recent political thought and reform in this country fully confirms the wisdom and penetrativeness of the author of the above speech. The Representative Assembly, which in his time consisted of 144 ryots, land-lords and merchants, is now twice as strong and counts some lawyers and other educated men among its members. The general tone of its deliberations is also improved. The repre-

representatives are better informed and more independent. But they are systematically snubbed and browbeaten by the all-powerful Dewans. About 500 subjects are pushed through the formality of a discussion within a week,—formality, because a number of questions remain unsettled and recurring for years together. Nor is there any influential officer, active or retired, anxious to educate the people politically and develop their institution. The present weakness and ineffectiveness of the Representative Assembly is attributed by some to its being a boon got unasked and not a right won by laborious agitation. To them, the only answer is that it was not given a fair and friendly chance for growth by the successors of its founder. The very care and persistence with which these have sought to stifle its voice are proofs positive of the jealousy and fear which it has already inspired in the official mind. In 1892 Lord Lansdowne received an address from it and said in reply:

It reflects the greatest credit upon the statesmanlike instincts of His Highness; and I feel sure that the fact of its constitution being to some extent based upon the principle of representation will greatly add to the weight of its deliberations and to the respect with which its suggestions will be received.

Mr. Keir Hardie, M. P. referred, of course, in graceful terms to the Institution in the course of the debate on Lord Morley's Reform Scheme in the Parliament. But in spite of all the boasted progress of recent years, it must be confessed that in power and prestige it remains the same as Rangacharlu left, if not worse. It is time for another democratic statesman to appear on the scene and turn it into a more useful and more respectable body.

VIEWS ON EDUCATIONAL AND SOCIAL QUESTIONS.

Advanced as Rangacharlu's political views were, it would be highly interesting at present to know what opinions he held on questions of education. Speaking at the distribution of prizes to the students of the Maharaja's College on 24th March 1882, under the Presidency of H. H. The late Maharaja, he said:

HIGHER EDUCATION.

If then Government had to contribute a portion of the cost of these collegiate institutions, whether Government

or aided, out of its revenues, it is a necessary contribution not to the students of the colleges, but to the people at large. No nation can thrive without a highly educated class at its head, and the system of Government schools can never be complete without the colleges. So long as these colleges are attended by all classes of people and a well-divided system of scholarships place them within the reach of the more gifted students of the poorer classes, Government must regard that it is the national and not individual interests that are served.

LEGISLATION FOR WOMEN.

Regarding the Position of women Rangacharlu said:—

I attach great importance to getting up amongst our leading families numbers of young ladies with a high English education who could feel for the advancement of their sex, and take up the same position to regard to them as that occupied by educated men in relation to their ignorant brethren. We cannot altogether trust in the legislation of men for the softer sex, any more than in the legislation of one class for another. Such legislation soothen apt to err as much on the side of extravagance, as on that of despotism, indulging in imaginary ideas of women's rights and other extravagant notions. The happy mean will be arrived at, if we leave to women all that concerns themselves to be judged and determined by the standard of their feelings and ideas on the subject.

The rational, progressive and yet nationalistic character of these conceptions is obvious. And considering the date of their utterance, no one can help admiring the breadth of their author's mind and its openness to modern healthy influences. Especially the last paragraph quoted above marks him off as a staunch liberal also in social matters.

CHARACTERISTICS.

We have characterized Rangacharlu as a democrat. He was also an autocrat in some respects; and in none more so than in the way in which he dealt with officials of a questionable character. He would fine them, transfer them over long distances or dismiss them summarily and even arbitrarily. His ear was always eager for reports regarding the conduct of officials. He had an ingenious way of collecting information about mofussil affairs through the leading men of Taluks and Districts and through the rural population. When news of some wayward or tyrannical officer reached him, he would himself set out, if possible, to the scene of tyranny, or send out spies, or summon the accused person himself to his presence. If the last was the case,

the very reception accorded to the accused would suffice to strike him with terror and turn him to the path of rectitude. If his guilt was proved, there was no escape for him from an exemplary punishment.

His was a life of untiring activity. He travelled often; and while travelling, he was not fastidious about his retinue and paraphernalia. He could not adhere mechanically to one programme of business, and would not confine himself to one topic or one language in his conversation. His brain knew no rest, and work seemed to be his rule of life. And this blessed contagion of restless, public-spirited work, he transmitted freely to those around him. A writer says:

If the archives of the Secretariat at Bangalore could be explored, a number of his minutes and memoranda might be brought out to guide and instruct the younger generation. The very G. O's issued under his authority or committed to him by the Chief Commissioner to be drafted are instructive and relate to almost every branch of the administration.

Rangacharlu was, as we have already seen, a great friend of the cultivator and this friendship he sometimes carried to such an extent as to seem offensive to the official class. When at a meeting of the Representative Assembly, an official referred tauntingly to the poor intellectual attainments of the ryot, he retorted by applauding the ryots' strong common sense and wide worldly experience which were sadly lacking in the official. When some one else remarked that, if the Dewan continued to show so much consideration and leniency to the representatives, the day would soon come when the officials would have to bribe them, Rangacharlu replied that he heartily welcomed that day. He would not have countenanced the idle contention that Mysore is a *Svaraj* State and that there is no gulf there yawning between "the tax-payers who are producers and the tax-gatherers who are consumers." He deplored the false ideas of authority and prestige that were then, and are even now, associated with the tenure of public office, and his foremost intention was to make the ryots, "whose status at the time of the Rendition was inferior to what it was in the neighbouring British districts," feel (1) that they possessed complete rights of property in their lands,

(ii) that the fruits of their labour were entirely theirs and (iii) that Government servants could not use them and could not command their services as they pleased. As to what Rangacharlu personally contributed towards the realisation of that intention, we have only to breathe out a heavy sigh of sorrow remembering that cruel death snatched him away on the 20th of January 1883, from amidst his labours. The event happened at Madras whither he had been to recover his health which had been shattered by official cares and ceaseless toil. But he had already laid the foundations and prepared the plans for the future edifice. As his successor himself admitted before the Representative Assembly in 1883,

The present policy of His Highness' Government is in the main, based on the lines so ably chalked out by him in many of the public speeches, both here and elsewhere, and I have no doubt that the great example which he has set us in his unwearied solicitude for the welfare of the people will long continue to encourage us in the discharge of our onerous public duties.

We have it on the authority of Lord Curzon that the Rendition of Mysore was "a great experiment. For if the result had been failure, then a cruel rebuff would have been administered to the generosity which dictated the proceeding, and the cause of Native States and of Native Administration throughout India must have suffered a lasting recoil." His Lordship has, however, acknowledged "unhesitatingly" that the State has been "well served." Towards this happy result, Rangacharlu's indirect and invisible contribution is perhaps not less valuable than what he personally and directly contributed. "I can confidently say that that 'remarkable statesman' Sir Seshadri Iyer owed to his chief Rangacharlu not a little of the strength and the noble thoughts and deeds which characterised his service to the state and its Ruler as Dewan."—so says Rai Bahadur A. Narasim Iyengar who calls Rangacharlu "a saint and genius" and who possesses a more intimate knowledge than most living men, both of Rangacharlu and of Sir Seshadri who, in the words of Lord Curzon, "for eighteen years wielded an authority that was a reflex of his powerful character and abilities."

During the days of Sir K. Seshadri Iyer and of alien ascendancy, the people learnt to value the republican virtues of their departed friend at their full worth. Even the most bigoted Mysoreans began to see distinctly that in the distribution of official patronage, Rangachariu had given preference to local talent as far as possible and had in all matters behaved as a native among the natives of the State and not as an outsider among outsiders. All India and India's English friends felt what a great and good personality passed away in Rangachariu and even the *Times* had a reference to make to the loss. *The beautiful Town-Hall in the heart of the Capital testifies to the gratitude of the people of Mysore to their great benefactor*

CONCLUSION.

It is not seldom that Indians have been characterized as a nation of dreamers and dotards, not endowed with a capacity for the practical affairs of the world and unfit for independent political or industrial life. But Rangachariu and Madhava Rao, Salar Jang and Seshiah Sastri, Ganishankar and Dinkar Rao have proved the utter absurdity of these reproaches. Again, even men of high authority in politics and sociology have called into question the suitability of representative political institutions for Indians. Some answer to them is surely furnished in the fact that such institutions had found favour with at least one indigenous statesman of modern times who was not a revolutionary or fire-brand and who lived and laboured when public agitation of any kind was practically unknown in the land. As a matter of fact, he anticipated the British Rulers in associating the governed with the Government.

But of late, there has been a lamentable scarcity of men who can take charge of the Governments of Native States and manage them at least keeping pace with, if they cannot surpass, the British Government. The Indian National Congress, if it has achieved nothing else, has at least given British India a good number of men who can intelligently study and discuss their administrative and economic problems. The affairs of Native States not being among the planks of the Congress

platform, they are not generally studied by British Indian politicians. Moreover, it is not every Native Prince that has the courage and personality of a Gaskwar to secure for the office of Dewan a Congressman of the type of the late Mr. R. C. Dutt, even if there should be such an one. In most of the Native States, the atmosphere is uncongenial for the growth of real statesmanship. If a State has, therefore, to import a Dewan, where is it to find one? Some old or retired servant of the British Indian Government might be available. But it is often doubtful whether he possesses the requisite physical and mental fitness. If he were to satisfy both these conditions, he will perhaps be too aged when he will have become conversant with all the details of the administration. And after all, he remains an outsider. Therefore, the best course in the matter for a Native Prince is to encourage the local men in public service and simultaneously to develop a vigorous public life in the State. A spirit of healthy rivalry may grow up between the two, each vying with the other in the promotion of public good. If the ruling class is shrewd and sympathetic, it will forestall the schemes and suggestions of the non-officials; if it is weak and vagrant, it will be led and controlled by the latter. This is no more than Rangachariu's own policy; and the Rulers of Native States will do well to consider it seriously betimes and convert their popular assemblies from mere ornamentations into realities. It behoves also the subjects of Native States to be more earnest about their own "interests and importance." They should keep themselves in touch with the current liberal thought and literature, watch the modern democratic and humanitarian movements and study the development of political institutions in the West. Lethargy which has hitherto been their ruling principle helps "neither altruism nor egoism." Now that with the late Dewan Bahadur R. Ragunatha Rao, the old generation of Native statesmen has disappeared, it is indeed a problem as to how the reputation which that generation has earned for Indian genius in the art of Government can be sustained.

LORD MORLEY ON HISTORY AND POLITICS.*

When I had the pleasure of coming among you a few months ago, I offered some remarks upon the obvious truth that democracy in the discussions of the day means government working through public opinion, and upon the equally urgent importance of a body, like this University, making its one part of its duties to help in forming those habits of mind upon which the soundness of opinion depends. To-night I propose to harp upon the same string, and to say something about politics and history. I intend a double subject with a single object. I need your indulgence, for of history I know too little, and of politics some of you may think I know too much, and know it wrong.

NEW SIGNS OF THE TIMES

Any reflective observer, if he likes, can sketch some of the signs of the times in rather formidable outline. Let us look at it. Political power is described as lying in the hands of a vast and mobile electorate, with scanty regard for tradition or history. Democracy, they say, is going to write its own programme. The structure of executive organs and machinery is undergoing half-hidden but serious alterations. Men discover a change of attitude towards law as law; a decline in reverence for institutions as institutions, and this change is not peculiar to England. Time and mutations of political atmosphere are incessantly attaching a different significance to the same ideas and the same words; yet we are apt to go on with our manful battles as if the flags and banners and vehement catchwords all stood for old causes. While intent, and with good reason, on the topics of the time—on strikes, aeroplanes, the gold reserve, the price of Console, China, Persia, Mesopotamian railways—is it possible that we are somnambulists, only half awake to strong currents racing in full blast over our heads and under the ground at our feet, and sweeping through the world of white men, black men, brown men, yellow men?

May I, without peril, add another element in the political landscape? I will borrow the language of a French critic. You have all heard how, just before the revolutionary storm broke over France in 1789, Sieyès published one of the most effective pamphlets ever written. Its title was this:—

* Address as Chancellor of the Manchester University.

"What is the Third Estate? Everything. What has it been in politics until now? Nothing. What does it ask? To become something." Our critic of to-day warns us that behind the third estate, behind the fourth estate, a fifth estate has risen, with which we have to count. "Women who were nothing, and who rather claim to be everything, to-morrow are going to be something."

Nothing is easier than to make a crisis out of this signal conjuncture of interesting, perplexing, and exciting circumstance. Still the long experience of our national history shows it safest, wisest, soundest, in respect of all English-speaking communities, to be in no hurry to believe that, in John Bunyan's pithy phrase, "passion will have all things now."

Contemporary history alone might teach us to take deep reaching change more patiently. One thing is certain. When new social ideas are slowly taking possession of a people, then is the time for all of us to remember the spirit of a passage from Spinoza, which I quoted here last time. "When I applied my mind to politics, so that I might examine what belongs to politics with the same precision of mind as we use for mathematics, I have taken my best pains not to laugh at the actions of mankind, not to groan over them, not to be angry with them, but to understand them." By understanding them he says he means looking at all the motives of human feeling, love, hatred, envy, ambition, pity—not as vices of human nature, but as properties belonging to it, just as heat, cold, storm, thunder belong to air and sky.

ROUSSEAU'S GREATNESS.

To-day, as it happens, is the anniversary of the birth of Rousseau a couple of hundred years ago. In the French Chamber, on a proposal last week to vote public money for its celebration, one side argued that it was absurd to magnify the father of anarchist theories, at a moment when police were shooting down anarchist bandits. The other side insisted that Rousseau was the precursor of modern conceptions of social justice, and had achieved decisive and persistent influence on French, German and Russian literature. A score of books in political literature rank as acts, not books. Whether a score or a hundred, the "Social Contract" was one. The "Institutions of the Christian Religion," launched in Geneva two centuries before Rousseau, was another. But Calvin, the Protestant pontiff from France, was no theorist. The rock on which he built his church was his own uncorrupted will and power.

to meet occasion, and this it was that made him one of the commanding forces in the world's history. Burke scourged Rousseau's name and his work with an energy only less savage than his estimate on the same page of Charles II. He rejoiced that Rousseau had none of the popularity here that followed him over the Continent of Europe. He went on as Wordsworth saw him—forewarning, denouncing, launching forth keen ridicule against all systems built on abstract thought, proclaiming the majesty of institutions and laws hallowed by time; with high disdain exploding upstart theory. Yet Maine, the most eminent English member of the Burkinian school—I do not forget Sir James Mackintosh—tells us that Rousseau, without learning, with few virtues, and with no strength of character, has nevertheless stamped himself ineffaceably on history by the force of a vivid imagination and a genuine love for his fellow-men, for which much will always have to be forgiven him. So the storm of our world-battle opened. It reached not politics only, but philosophy, art, letters, churches, education; for what strikes deep in politics, strikes deep all round. History on one side, Law of Nature and Rights of Man on the other.

THE "CONTRACT SOCIAL"

You know the electrifying first sentence of Rousseau's "Social Contract." "Man is born free and everywhere he is in chains. One supposes himself the master of others, who is none the less for that more of a slave than they are." The second sentence of Jefferson's Declaration of Independence 14 years later; the just sequel to Petition of Right, Bill of Rights in our earlier civilian wars, is a resounding echo. "We hold these truths to be self-evident; that all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness, that to secure these rights governments are instituted among men, deriving their just powers from the consent of the governed."

It is so easy for the judicious critic of a later day to riddle a book like the "Social Contract" with shot and shell of logic, doctrine, figures, history. More than one distinguished master of political and legal philosophy in our own day and generation has subjected it to searching analysis, of weight and significance. But besides all that, it is history that matters and the long tale of consummating circumstances. And, after all, the association of the law of Nature with humanity has in all ages been very close. Let us realize

with what effulgence books burst upon communities oppressed by wrong, sunk in care, inflamed by passions of religion or of liberty, the two eternal fields of mortal struggle.

THE POWER OF POLITICAL BOOKS.

The power of a political book depends on its fitness for occasion as occasions emerge. Crop depends on soil as well as seed. It is not abstract or absolute strength in argument or conclusion, but the fact, half accident, of its happening to supply an impressive, persuasive, exciting, attack or defence, or some set of formulae that the passion needs, or curiosity of the hour demands. Books, doctrines, ideas have been compared to the flowers in a garden. 'Tis not always the best argument that prevails, and the gardener wins the prize who chooses his season right. How much of their time do even good writers pass in minting coin that has no currency. And in passing from that glorious dome of printed books in the British Museum to the sepulchral monuments in another department I sometimes think that in vitality there is not much to choose.

It is easy to expose fallacies in the Declaration of Independence. The point is that, as an American historian records with truth, it was "the genuine effusion of the soul of the country at the time." Yet what a sound instinct for politics, addressed to Englishmen of the stamp of the American colonists, inspired Tom Paine when he fired the revolutionary train by the most influential political piece that ever was composed, and called it by the wholesome, persuasive and well-justified name of "Common Sense." Quarrels about the best form of government, the balance of orders in the State, even natural rights were comparatively old stories. Men are wont to use so much of these great oracular deliverances as the moment needs, and four score and seven years passed before a nobler President than Jefferson was able to bring his country round to his faith that if slavery is not wrong, nothing is wrong. It is not abstract books that thrive in the day of trouble on either side of the Atlantic Ocean. The language of our great Agamemnon of political conflict, alike in France and in America, went deeper to the potent roots. It was, as Burke said, not on these things, but on the point of taxes that the ablest pens and most eloquent tongues have been exercised, the greatest spirits have acted and suffered. They took infinite pains to set up as a fundamental principle that in all monarchies the people must in effect themselves, mediate or immediately, possess the power of

granting their own money, or no shadow of liberty could subsist.

Yet rates and taxes are not everything. Evolution is the most overworked word in all the language of the day. But we cannot do without it, and those are right who say that in the evolution of politics nothing has been more important than the successive emergence of such new moral entities as justice, freedom, right. History made English their vernacular. Whether Burke in his best pieces or Aristotle in his "Politics" shows the wider knowledge of human nature learned men do not decide. At least the philosopher of small city States, even with the intellect of Aristotle, could not be expected to have any idea of that representative government which is the greatest political fact of to-day. It was Locke in the 17th century who in connection with the settlement of the Monarchy, that we are to call a revolution, not a rebellion, first set out, as has been said, constitutional government in terms of thought, and furnished the main-spring of political philosophy for long ages after. From him both Montesquieu and Rousseau, the famous heads of two opposed schools and rival methods, drew their inspiration. Countless are the governing systems all over the globe that have found their model here, and we may record with no ignoble pride that the tongue of our English masters of political wisdom is spoken by 160 millions, as against 130 for Russia, 85 of German, 60 of Spanish, and 45 of French. I do not forget that among 90 or 100 millions of our triumphant figure the King's writ does not run; for they live under the Stars and Stripes.

WORDS AND IDEAS IN POLITICS.

Let me give you a sobering thought from Locke himself:—

"If any one shall well consider the errors and obscurity, the mistakes and confusion, that are spread in the world by an ill use of words, he will find some reason to doubt whether language, as it has been employed, has contributed more to the improvement or hindrance of knowledge among mankind."

Dismal as this thought must be at any time, how especially perturbing to people with such questions before them as we are called upon to face to-day? Now, if ever, what mistakes and confusion are likely to follow an ill use of political words, and of the ideas that words stand for. What would become of a lawyer at Lincoln's Inn, who argued his cases with the looseness in point and language, the

disregard of apt precedents, the slack concatenation of premiss and conclusion, the readiness to take one authority for as good as another, which even the best of us find good enough for politics? Is there any other field where Bacon's famous idols of Theatre, Tribe, Market Place, and Cave keep such complacent house together?

A learned man who was Chancellor of the Exchequer in 1857 wrote a little book on what he styled the use and abuse of political terms. It has little sap, but puts useful posers as to the exact classification of the varieties of Republic and Monarchy. It is democracy where a majority of adult males have direct legal influence in the formation of the sovereign body. It is aristocracy where this majority have not direct legal influence. Is democracy a system in which the many govern or, as Aristotle supposed, a system in which the poor govern? And so forth, with a general suggestion of loose and inapplicable terms being the links that chain men to unreasonable practices.

The ideas and words that seem simplest turn out most complex. If anybody doubts ask him to try his hand, say, on Liberty, Equality, and Fraternity. He will be very lucky if, besides being complex, he does not find their contents and applications directly contradictory. Take Cavour's famous formula "A free Church in a free State." What could be simpler, more direct, more pleasant and easy music to the politician's ear; yet of what harsh, afflicting, and intractable discords was not this theme the prelude? Of liberty, we have been told on the best authority, there are 200 definitions. Even the consecrated name of public opinion has many shades. One constitutional writer in whom learning has been by no means fatal to wit—and neither law nor politics is without possible points of humour—puts it that the opinion of Parliament is the opinion of yesterday, and the opinion of Judges is that of the day before yesterday. That is, the Judges go by precedent and old canons of interpretation, while Parliament makes laws, imposes taxes, regulates foreign relations, in response to movements outside, and the ebb and flow of political tides outside seem to obey the motions of an inconstant moon. In politics, is it the voice of the electorate? Beyond politics, is it that favourable balance of leading articles which is called a good Press?

Who of us in arguing for or against an institution draws distinctions between its formal and legal character and its actual work in practice? Or make allowance for the spirit of those who carry it on? Or for the weight of its traditional

associations? A very interesting writer of our own time emphasizes the non-rational element in politics, impulse, instinct, reaction. As a man who has spent most of his days in politics you will not wonder that I read with a rueful eye Mr. Graham Wallis's rather cynical dictum that the empirical art of politics consists largely in the creation of opinion by the deliberate exploitation of sub-conscious non-rational inference.

POLITICAL SCIENCE.

Here you are excellently furnished with teachers of politics both directly and in connection with ethics, economics, or law. I have been looking through the examination papers, with sincere respect for those who set them and a touch of envy for those who could answer. London University has notably broken ground in a well-known school served by accomplished professors and attended by hundreds of assiduous listeners. At Oxford, where in my days there long ago such projects would have seemed irrelevant and Utopian folly, they have recently instituted a lecturer on political theory and institutions, and a diploma in economics and political science. International law and political economy have lecturers and professors. There and at Cambridge they are trying to cover a good deal of the ground that is occupied by the well-known school of political science founded in Paris after the catastrophe of 1870, and with the express design of repairing the political ignorance in the governing classes, which was one, at any rate, of the causes of that catastrophe.

Its courses include international law, public, and private, the diplomatic history of Europe, the history of colonial expansion, the history of the Eastern question, the study of Constitution, commercial geography, administrative law, and so forth. Its ends have been attained. Embassies, Consulates, the Council of State, the inspectorships of finance are manned by former pupils. Parliament, letters, the better journals owe it an acknowledged debt, and its influence upon the generation that have sprung up since the war 40 years since has been marked.

To-night is not the time for discussing whether there is such a thing as political science. I need not try, for the work has been incomparably well done for our purposes in Sir Frederick Pollock's short volume on the History of the Science of Politics. Is there any true analogy between the body politic and the body natural; are the methods and processes of politics to be brought

within sight of the methods and process of biology? The politician may borrow phrases from the biologist, and talk of embryos, germs, organisms, but surely those are right who insist that we have not come near to the definite erection of an inductive political science.

That is certainly no reason why either the politician should not reason, or the historian should not explore, say, with the methodical energy, caution, conscience, candour, and determined love of truth that marked Darwin, and the heroes of the natural sciences.

A NEW PROFESSORSHIP.

Political science suffers from the same defect as political economy in the earlier part of the nineteenth century. There is a certain rarefaction in the atmosphere. The politician man wears the same artificial character as the economic man. Ethical considerations pass for so much fiction. Matters are too much confined to description of political mechanics. The propositions are too mechanical and too elaborate, and too little account is made of ministering to the progress of society. The growth and direction of new opinion, the effectiveness of political institutions in giving expression to new opinion, are treated as secondary, or not treated at all. The lines laid down by my friend, Professor Dicey, in his book on the relation between law and opinion in the 19th century, deserve to be followed, and they are sure to be. The science so conceived will realize that the value of political forms is to be measured by what they do. They must express and answer the mind and purposes of a State, in their simplest bearings. I hope all this is not ungrateful to a group of writers in this country who in the last few years have filled a truly important bookshelf in any library pretending to be on the highest level in this truly important sphere—with Green, Pollock, Dicey, Hobhouse, Bosanquet, Wallas among them. Let nobody suppose that speculations as to the State and its various relations to the individual are immaterial. It is held that the attempt of certain French teachers to present German theories of the State in French dress are directly responsible for Syndicalism in France. I venture to believe that here is the field for a new course, and an extra chair in your splendid list. I mean a chair that would set an example of accurate use of terms in great national affairs and relations; of a systematical inquiry into historical origins of contemporary cases; of the commonplace, but neglected truth that it does not follow that if

only people enough hold an opinion it must therefore be both true and apt; of coherence and classification in our survey and treatment of political problems. If I had the privilege of adding a new chair it should be a Chair of Politics. Politics, in the sense that I am suggesting, is different from law because law tends to stereotype thought by forcing it into fixed categories, but political science, rightly handled is for ever re-opening these categories to examine how they answer to contemporary facts. Political science is wider than law, because its work may be said to begin where law ends. It is less wide than sociology, because it starts from the assumption of the State with all its rights, powers, and duties.

More than once the most tremendous political effects have flowed from books and speculations that had nothing to do with politics. Who can measure the influence on contemporary politics of Duran and the other literature of survival of the fittest, and not only on practical politics, but its decisive contributory influence upon active and powerful schools of written history? How constantly again, have the immense phenomena of Churches, Catholic and Protestant, so imposing and so penetrating, been the gravest chapter in the history of States!

THE CONTINUITY OF HISTORY.

Contemporary history is a long affair. A fortnight ago in the foreign telegrams that fill an invaluable page in the *Times* every morning you would have found this from Athens:—

"To-day being the anniversary of the capture of Constantinople by the Turks, a Litany for the repose of the soul of the last Greek Emperor, Constantine Palaeologus, was sung in the Cathedral here in the presence of Princes Nicholas and Andrew, the Prime Minister, and other dignitaries."

This commemoration at Athens of the tremendous event that came to pass at Constantinople 460 years ago is no cinder from a dead fire, but quite a live coal. At least one of the modern giants of political philosophy seems to regard it as a blessing that Mahomed II. put an end to Byzantine confusion, just as Landor used to regret that Charles Martel won the Battle of Tours.

The first speech I heard in my life, when I was a school boy, I suppose some time in 1850, was in your neighbouring Blackburn, one of Keoth's passionate denunciations of Austrian power and Russian intervention. The telegrams tell you every morning that this question too still smoulders. For some of you foreign politics

begin with memories of the Crimean War. The near East is assuredly no dead volcano.

A man who wishes to trace its perplexities to their source will not forget the history of the claims, ambitions, and pretensions of Prussia, Austria, Russia, when they partitioned Poland 140 years ago. Well did Burke, in 1772, warn Europe that Poland was but a breakfast for the great armed Powers, but where would they dine? "After all our love of tranquillity," he exclaimed, "and all our expedients to preserve it, alas! poor Peace!" And well does the historian to-day declare in a poignant sentence, the partition of Poland might have been a statesmanlike performance if it could have stopped in 1772, but *history never does stop short*, and in 20 years Europe found itself in the whirlpool of the French revolutionary wars which came to a close at Waterloo.

That is the worst of it. History never does stop short. If you are of the school that insists on the event being its own justification, on fact and reason being the same thing, on the real and the rational being identical, on force and right being all one, at least be sure that you have the fact in full, and the event in all its dimensions, and its duration.

THE SNARE OF PARALLELS.

Historical parallels are a snare to working statesmen, and ludicrous misapplications from Greece and Rome inspired some of the worst aberrations of the French Revolution. They are convenient to the politician; a plausible parallel makes him feel sure of his ground. Mr. Bryce, no second rate authority, holds that, though usually interesting and often illuminating, what are called historians' parallels are often misleading. He tells how during the great dispute in 1876, after the Bulgarian massacre, between those who thought we ought to back the Sultan, and those who were equally convinced the other way, he met one day in the street an eminent historical professor who was fond of descanting on the value of history as a guide to politics. They talked of the crisis in the East. This is Mr. Bryce's story:—"I said, 'Here is a fine opportunity for applying your doctrines. Party politicians may be divided, but no student of history can doubt which is the right course for the Government to follow towards Russia and the Turks.' 'Certainly,' he replied, 'the teachings of history are plain. You mean, of course,' I said, scenting some signs of disagreement, that we ought to warn the Sultan that he is wholly in the wrong and can't

support from us? 'No indeed,' rejoined my friend, 'I mean just the opposite.'

In truth, say what we will of the unity of history and the identity in the elements of human nature, the general body of a political case is never exactly the same.

Machiavelli will have it that the revolution of the wheel of human fortune brings past situations back to new points. A wiser school insists that history never repeats itself.

According to some scientific historians with a right to speak, history does not solve questions; it teaches us to examine. After a life of labour in examination a great event, they say, is seldom fully understood by those who worked for it. Our vision is surer about the past, there we have the whole: *we see the beginning and the end*, we distinguish essential from accessory. To contemporaries events are confused, obscured by passing accidents, mixed with all sorts of foreign elements. Both contemporaries and historians, more often than they suppose, miss a vital point because they do not know that intuitive instinct which often goes farther in the statesman's mind than deliberate analysis in argument. A visitor of Bismarck's once reminded him that Schopenhauer used to sit with him at dinner every day in the hotel at Frankfurt. "I had no business with him. I had neither time nor inclination for philosophy," said Bismarck, "and I know nothing of Schopenhauer's system." It was summarily explained to him as veering the primacy of the will in self-consciousness. "I dare say that may be all right," he said, "for myself, at least, I have often noticed that my will had decided before my thinking was finished." Improvisation has more to do in politics than people think.

IS THERE A GUIDING THREAD?

I can do no more than name another question that has had such invincible interest for powerful minds: Is there a central thread to guide us along a main course in the movements of the world? Are the movements onward?

History, in the great conception of it, has often been compared to a mountain chain seen far off in a clear sky, where the peaks seem linked to one another towards the higher crest of the group. An ingenious and learned writer the other day amplified this famous image by speaking of a set of volcanic islands heaving themselves out of the sea, at such angles and distances that only to the eye of a bird, and not to a sailor cruising among them would they appear as the heights of one and the same submerged range. The sailor, I take it

is the politician. The historian, without prejudice to monographic exploration in intervening valleys and ascending slopes, will covet the vision of the bird.

The unity of history is now orthodox doctrine, though accepted, as orthodox doctrines sometimes are in various senses. Acton put it that "History embraces ideas as much as events, and derives its best virtue from regions beyond the sphere of States."

A younger student, whose ability Acton recognized and highly valued, puts it a little more fully—"No presentation of history can be adequate which neglects the growth of the religious consciousness, of literature, of the moral and physical science, of art, of scholarship, of social life."

The essential merit of the statesman, that he does not mistake a part for the whole, belongs equally to the responsible citizen with a sense of public duty, and to the best historian. But on another side the temper of the time is adverse. Harnack says that in 1700 the most universal or encyclopedic mind, that is to say, mind at home over the field of knowledge, thought, feeling—was Leibnitz, and in 1800 it was Goethe. I suppose nobody would dispute that in 1600 it was Bacon. To whom would competent authorities give the palm in 1900? If we are slow to answer, is not the reason that advance of specialization over the whole field of knowledge has made the encyclopedic mind an anachronism?

PROGRESS NOT UNIVERSAL.

Many people, and among them some of the wisest and most helpful of mankind, treat Progress as if it were as much a universal law of the human race as the law of gravitation in the world of matter. A universal law, for all times, all States, all Societies, it is not. Even for ourselves, authority is not all our way. Angles and distances make all the difference to the eagles and falcons who survey history. We know more and more of Nature in the world of matter; have more power over its energies, men have increased and multiplied and spread out over the globe, life is longer, vigour and endurance have waxed, not waned. International law, though important chapters are still to come, has made much way since Grotius wrote one of the cardinal books in European history. Forgive me for mentioning a word of wrath, but the curse of the industrial system is insecurity, and the principle of insurance, applied to risks of every kind, has extended and ramified in a really extraordinary way during the last 60 years, and

it is now one of the subtlest international agencies, uniting distant interests and creating perforce a thousand mutual obligations. A fraction of mankind has access to higher standards of comfort and well-being. For a thousand years, Michelet says, Europe was unwashed. That at least is no longer absolutely true. Even in this sphere there is more than one set-off to the exhilarating advance. Coal supply, iron ore of the American Lakes, the oil supply in Russia, Persia, Burma, are not inexhaustible. Towering States have vanished like shooting stars. Rome is not, in Byron's desolate line, the only lone mother of dead empires.

You remember Gibbon's declaration that if a man were called to fix the period in the history of the world during which the condition of the human race was most happy and prosperous, he would without hesitation name the period between the death of Domitian and the accession of Commodus. It is nearly a century and a half since Gibbon wrote. The great historian of Rome of our own day and generation with characteristic daring puts and answers the same question. "If an angel of the Lord," Mommsen assures us, "were to strike the balance whether the domain ruled by Severus Antoninus was governed with the greater intelligence and the greater humanity then or now, whether civilization and general prosperity have since then advanced or retrograded, it is very doubtful whether the decision would favour the present." Then again observers who know and have thought much about it pronounce it not clear that Western contact with Eastern races will increase the sum of human happiness.

After all, it is well to measure the procession of changes that have marked culture, civilization, and the modern world, against some stupendous fixities of human things. If we think, for example, of all that language means, of the unplumbed depths of mortal thought, mood, aim, appetite, right, duty, kindness, savagery, and yet how stable language is amidst the vortex and how immutably the tongues of leading stocks in the world seem to have struck their roots. And in the four great faiths—Christianity, Judaism, Islam, Buddha—in spite of reformation, counter-reformation, internecine conflict within, displacement by fire and sword from without, yet how steadfastly the same, the rites, the practices, and traditions persist.

IDEALS AND FACTS.

A well-trained observer finds history abounding in volcanic outbreaks of fire and flame, seeing only

to leave behind hardened lava and frozen mud. Only too true. But it is wrong to be over-impatient with what may prove to be fertilizing Nile floods; they will subside, and something will remain for the hand of the reaper.

Ardent spirits have common faults in a stirring age. We know it all. They are so apt to begin where they should end. Pierced by thoughts of the ills in the world around them, they are overwhelmed by a noble impatience to remove, to lessen, to abate. Before they have set sail they insist that they already see some new planet, swimming into their ken, and touch the promised land. An abstract *a priori* notion, formed independently of experience, independently of evidence, is straightway clothed with all the sanctity of absolute principle. Generous aspiration, exalted enthusiasm, is made to do duty for reasoned scrutiny. They seize every fact of circumstance that makes their way; they are blind to every other. Inflexible preconceptions hold the helm. They exaggerate, their sense of proportion is bad. If by chance any party politicians are with us they will observe that in this place to-night I am bound to carry political impartiality to the point of passion, and they will not quarrel with me for saying that such vices of political method as I have hinted at—the substitution of generous illusion for cool induction—are just as common among glowing Conservatives as among glowing Liberals. Nobody in camp will quarrel with the view that one of the urgent needs of to-day is a resolute attempt to systematize political thoughts and to bring ideals into touch with fact. There is no reason why that should turn brave and hopeful men into narrow, dry, or cold-hearted.

Books on political fundamentals are apt not to be refreshing. They do not always keep on the level of the noblest aspects of the State; though government is concerned with men and life, yet few books are so little written in terms of life as books on government. "The true law-giver," says Burke, "ought to have a heart full of sensibility. He ought to love and respect mankind, and to fear himself Political arrangement, as it is a work for social ends, is only to be wrought by social means. Mind must combine with mind. Time is required to produce that union of minds which alone can produce all the good we aim at." There is exemplar both in aim and method; Burke, not Coleridge; not only wisdom, but wisdom; applicable and applied; and there is the philosophy of political party. "How vague and cloudy, we are told, were many

of the German treatises of the last 60 years on the theory of State."

This was said by that admirably equipped historian, jurist, traveller, and man of State affairs, who now represents this country at Washington. Even those who insist most strongly that the abstract paves the way for the concrete; transcendental is the only secure basis for order by government; and evolution of the Absolute is the right precursor of Sadowna and Seldan, cannot but admit that in Germany at least, it was the dynasty of historians, and not the abstract men, who supplied the clenchers for public opinion and resolve. And, by the way, pilgrims to Konigsberg should not omit from their happy musings the fact that one of the notable minor writings of the Konigsberg philosopher was a solid plea for perpetual peace.

Treitschke, the last and most brilliant of the dynasty, one day fell upon a volume of the letters of Cavour. "Nothing for a long time has chained my attention so fast. This intensely practical genius is no doubt different by a whole heaven's breadth from the great poets and thinkers that are so trusted by us Germans. Yet he stands in his own way before the riddles of the world as great as Goethe or Kant." Never was statesman, not even Machiavelli, to whom the abstract

was more alien than to Cavour, though nobody took better advantage of the ardour kindled by less practical idealists than himself. With Treitschke reaction went far. He delivered lectures for several years on what he named *Politik*, now accessible in a couple of volumes, twice as long as Machiavelli's *Prince*, and 20 times as little tending to edification. No professor in this University could keep a class for a month upon *Politik* of that stamp.

A LESSON FROM AMERICA.

I will end where I began. I said something here last November about the importance of erecting an active, alert, and trained public opinion. Only a commonplace, to be sure.

The star of strength and greatness rises or sinks in a State according to the proportions in its numbers of men and women with courage, energy, will, and open, supple, teachable intelligence, and then, besides, on their power of making their qualities effectively felt. If we are in Carlyle's genial phrase so many millions mostly fools, and if those who are not fools are but as dumb dogs, then the case is desperate. But before losing heart, let us be sure that our political arithmetic and algebra are right.

REQUIEM.

(In Memory of a Beloved Sister.)

BY MRS. SAROJINI NAIDU.

She who would guard our sleep with anxious care
To day we watch her sleeping;
She who would still our tears upon her breast
Now leaves us weeping.

She who hath sewed us with a love so deep,
Loyal and sweet and tender—
To day for her these last few poignant rites
Sadly we render.

She who would answer to our lightest call
To day she gives no token!
Does She not know because her lips are dumb,
Our hearts are broken?

Current Events.

BY RAJDUARI.

BLUFF OR CIVIL WAR?

THE question of questions which is at present agitating the United Kingdom is the bitter, angry, nay threatening, war of words between the ministers and Messrs. Bonar Law & Co. outside the hall of St. Stephens, in reference to the Home Rule Bill. The men of Ulster, backed by the fire eating spirits of the extreme party or faction of Unionists, are all for a fight, tooth and nail, in the event of the passing of the Home Rule Bill. "Ulster will fight," that is the cry. But there are many a sober people who shake their heads whether the cry will ever become a reality. In other words they understand it as a mere game of "bluff." Whether it is or it is not a bluff will soon become apparent. At present there is a lull in active parliamentary warfare owing to the short adjournment. The wearied legislators are taking rest. The brief respite is unlikely to be marked by any stirring "event," albeit that we may hear more of sound and fury from the new species of Solemn Covenanters who have just formed themselves into a league. "They stood prepared to die," so said the poet who had sung of the sturdy Covenanters of old. Is this new-fangled genus of the opening Twentieth Century going to rival or even surpass the stern and devoted bard who had vowed themselves to die? We shall see. The air of Ulster may resound with the war-cry under the banner of Bonar Law and Sir Edward Carson. Whether the war-drum will beat fast and furious and array these mock heroes to the reality of action is a question. Arms and ammunition are talked of. So, too, treason against the state. It will be an evil day when the die is cast and the solemn leagues march on Dublin Castle and plant their banner of territorial independence. Home Rulers meanwhile are amused

and await the mighty events with deepest coolness and composure. They at least do not scent the gunpowder from far or near—and they are an index to the Irish cyclone, if it be at all coming. To us onlookers at this great distance all this seems to be a matter of regret. Party politics have indeed run high and hot. But it is to be devoutly hoped that calmer counsel would prevail and each side soon sheath the weapon that they are so wildly brandishing in the air which is charged with their own partisan electricity and all the present presage and wrath will prove to be a mockery.

THE MASSINGHAM MISSILE.

As if Irish affairs were not enough for the two great parties to fiercely wrangle about, there are the dissensions in the different camps—of Unionists, of Radicals, and of Labourites. The quarrel, however among the extreme wing of the Radicals is the subject of much animated controversy in the Press. The Radical party is a house divided against itself. Sooner or later it is inevitable that the split will lead to new developments and add some more party names to the existing nomenclature in politics. As we write the intrepid Massingham is waging a war outright in the columns of his own paper and the *Daily News* against that effete Liberalism which is undistinguishable from Tory Chauvinism. Having come to power six years ago with a deliberate promise to their electors to effect retrenchment and economy all round, notably in connexion with the bloated armaments, the Liberal Ministry so-called and their supporters have miserably failed to keep up their promise. No doubt there have been extenuating circumstances, and circumstances, they say, alter the best resolutions. Many an event has happened in international politics which has made old England tremble for her very safety which is all based on her naval supremacy. But apart from international politics there have been questions of domestic economy. Local reforms of a Colonial character

have been taken on hand with a rapidity which has been more than once challenged. The more cautious and slow-going have questioned "Lloyd George finance" They cannot share the opinion that it is a blessing every way. Immense strides have been taken in colossal financial undertakings ostensibly for the benefit of the poor and the helpless, which have been condemned as not only hasty but ill planned, ill-considered and ill digested. There is waging at present a bloodless rebellion against Mr. George's Insurance Act. The medical faculty has raised the standard of revolt against the measure, more or less on purely personal grounds. They have conjured a host of nonsensical evils because their vested interests are supposed to be threatened. And as there are divers medical organisations in the country there is no limit to the combined conspiracy of the faculty against the new law. These have been actively propagating their own ill judged propaganda among the mass of the ignorant and semi-ignorant shop girls, seamstresses, domestic servants, and so on, which is certain to give infinite trouble. Judging from afar it would seem that there is little of a rational foundation in the revolt led by the British Medical Association. It is the case, once more, of working on the mute nature of unthinking humanity. The large majority who will come under the scope of the Insurance Law are not capable of thinking for themselves of the benefit or evil of that measure. They believe what the interested agitators have been sedulously instilling in their unsophisticated minds. In short, they are a flock of sheep who follow, for the time being, those who lead them in the present moral and unpatriotic agitation. Of course Mr. Lloyd George has raised a swarm of hornets around him. He has been over-confident in the ultimate success of his legislation. At the same time sagacious and cautious statesmanship might have taken care to conciliate opposition by taking it into his confidence, duly considering objections,

and offering to remove such as were really harmful. So that, practically mistakes have been made on both sides. Things have gone out of hand and it remains to be seen whether it is the revoltors who bend the redoubtable Chancellor or that the Chancellor brings to bay the hallooing pack of the medical faculty supported by its unthinking mass. It is feared that the Ministry, whenever it goes before the electors, is bound to go unrespected because of this unpopular measure. There will be such an aversion to the party that out of wantonness alone, the votes of the majority in the country will go to their opponents who will march triumphantly to Westminster Palace to take their seat on the ministerial front bench.

COLONIAL NAVAL DEFENCE.

Meanwhile the Colonials are forging ahead through their trusted representatives in the Council of Naval Defence. The Ministry has been confabulating with the Colonial Premiers, notably Mr. Borden of Canada, and endeavouring to formulate a working basis as to how the Naval Defence of Great Britain in her overseas dominions should be conducted. The daughter colonies are exceedingly affectionate towards their great Mother Country and vying with each other to come to her protection, strong as she is, in case she is threatened. There can be no better proof of filial gratitude at the bottom of which also is that innate spirit of British patriotism. Britannia has ruled the waves supremely for over a century. Britons never can be slaves. It is to prevent their becoming slaves to any mighty power in the future that they are all now concerting together. But there are people who are equally patriotic, albeit indeed with a sensitive economic conscience. These inquire whether it bodes any good that in pursuit of the future naval will-o'-the-wisp or hobgoblin which they have conjured they should blindly go on constructing huge naval armaments and vessels, burdening the taxpayers to an extent unparalleled. Have these

men thought of the morrow? Have they given a thought to the contingency that English wealth and English prosperity may decline, that the taxpayer may be crippled, and that with that crippling the day of tribulation and humiliation may come. Indeed these sober economic people, while not unmindful of naval rivalry by other powers, are of opinion that a serious abatement in the mad pursuit of bloated naval armaments is imperative. For, long before naval injury can take place there will set in a dry economic rot in the nation which by itself may render harm worse than a defeat by a foreign power.

TRADE AND CONSOLS.

Meanwhile there is no limit to the growth of Great Britain's foreign trade which first began to take a leap upward three years ago. Nothing could be a better indication of the greater prosperity of the people than this trade. But when all is said it must not be forgotten that trade has its cycles of lean and fat years. There may be years of the lowest depression and years of the greatest prosperity. If at one time the nadir has been reached at another the zenith is also reached. But the steady fall in Consols is the subject of much discussion sometime past. The *Economist*, however, has rendered useful service in offering in one of its recent issues a lucid explanation of the decline. The extension of the scope of the investment of Securities by private and public trustees under the Trustees Act gave the opportunity to select other securities than consols for investments. To the extent that such investments went on the investments in consols necessarily diminished. There was less demand. While this economical phenomenon was going on almost unseen, there came the Boer war entailing an immense loan of 160 millions sterling. Such a tremendous supply of consols necessarily aggravated the previous economic situation. Consols were less and less in demand. Necessarily prices have steadily fallen. The only way to pre-

vent a further fall, if not to induce a rise, is to make consols more marketable. In other words there should be created a large demand for them. It is doubtful if investors can cause such a demand in the face of competing Trustees' securities. The only way is for the Government to extinguish a part of the national debt by a moderate purchase of the consols themselves. The phenomenon, however, it should be remembered, is not confined to England alone. France, Germany, Austria, Italy, Sweden, Denmark, all have witnessed a decline more or less in their respective securities. Consols, or *Rentes* or state bonds everywhere must remain in a condition of diminished demand so long as other competitive securities, allowed by the different states, continue to be more attractive by reason of a more profitable investment. Industrialism has in reality diminished the demand for this kind of paper.

FRANCE AND RUSSIA.

Once more Europe's attention was attracted by the recent visit of the French Premier, Mon. Poincaré to the Tsar, following so closely on the interview of the Kaiser, with that autocrat in the Baltic. It seems that the Great Continental Powers are revising their alliances and spheres of influence and interest. It is not at all surprising, therefore, if France has been anxious to see that Russia in no way deviates from her friendship, so long and so close, with her. Germany is naturally the suspect of both France and Russia. And she is now the subject of great suspicion to the generality of the people of Great Britain. She is coming to be regarded as the one foe in Europe to be greatly dreaded and therefore to be closely watched. If the battle of Waterloo witnessed a complete change in the "balance of power" on the Continent, it seems that the present political condition, backed by bloated armaments, naval and military, has produced altogether a new revolution the end of which none can forecast. The drama has just

begun; but all the states, with the natural instinct of life preservation, are trying to put their respective houses in order. Necessarily a revision of alliances, influences and interests, has been to the fore. And if Mon. Poincaré has returned with greater re-assurance and confidence from St. Petersburg, we are led to hope for greater chances of a pacific condition of Europe in the immediate future.

ITALY AND TURKEY

It is reported that there is a feeling now to bring about some practical arrangement by means of which peace might be brought between Italy and Turkey. Both the belligerents are sick at heart and would like that some good fairy would intervene who might bring an honourable peace. Such a peace must have for its working hypothesis *do ut des*, give and take. Italy must be prepared for some reasonable sacrifice and so, too, must Turkey. If each is disposed to treat for peace in this fashion the happy end might soon be attained. False pride and sentiment, too much about hollow *prestige* and so on, however, often comes in the way of the warring parties. This makes itself difficult to establish peace. But Italy is daily sinking deeper and deeper in financial mire, albeit the eyewash which the Foreign Minister and the Chancellor strenuously endeavour to apply to the ordinary Italian eye. If naught else, a depleted treasury, with the growing burden of national debt and national expenditure, must compel Italy to end the war. Turkey may not be so financially embarrassed as Italy, but she is immersed in domestic difficulties of no ordinary character, apart from Albanian and other Balkan imbroglios now thickening. The Balkan states are in an exceedingly bad plight. They have been causing great alarm to Europe. So much so that Austria has been furtively inviting the great Powers to a conference the aims of which are still in a nebulous condition. What may be behind Mr. Borchgrevink's invitation can only be guessed. The Turks are

alarmed lest it may be the precursor of Montenegrin and Albanian independence. The former is just now warlike, no doubt, secretly under Austrian inspiration or instigation. The Albanians, as we write, are said to be sheathing their weapons and returning home from the frontiers. But all these are mere ephemeral truce. One cannot say, when Albania may have permanent quiet. Meanwhile the revolution which took place in the Turkish Cabinet some three weeks ago is the subject of much curiosity and interest to the neighbouring powers. The back of the Committee of Union and Progress, with its replica of a modified Hamidian regime is being broken, as it were, by the Ministry of all the Talents now in power. It was forecast that it would not last a week, but there is every sign of its lasting many, many weeks. Turkey is a house divided against itself while enveloped on all sides by complications which, on the least provocation, may burst out into a terrible conflagration. Much will depend on the new Ministry, how it steers the bark at Bosphorus.

THE EAST

There is nothing special to say about Persia. Things seem to be quieting down. But there is the recess in British Parliament, and if we are to rely on our past experience, we ought soon to hear of something important connected with the subterranean diplomacy of Russia. It is always active when Ministers have some rest from inquisitive interpellations in the British Parliament. Anyhow that has been the case in reference to Indo-Russian policy. Our scares, expeditions, embassies and what not, all have been known in the past to be most active when Parliament is not in session.

Japan has lost her first constitutional Emperor, while his trusted Minister, Prince Katsura, was in communication at St. Petersburg as to how they should take joint action under certain eventualities against China with reference to Mongolia

and Manchuria. The "arrangements" how to stew John Chinaman are now said to be all completed and the diplomat is back on his way to Tokio. Soon after the funeral ceremonies of the deceased Emperor are over, we may hear of some fresh developments in the Far East. Already the authority of Yuan-Shi-Kai is being threatened by a faction of malcontents who are breathing fire and fury at the executions of two suspected generals by order of that great President. Peking is in a ferment and the Southerners are defying the President. There was a wild rumour of the assassination of Dr. Sun Yat Sen but happily for the Republic it had been contradicted. China is at sixes and sevens and though Yuan-Shi Kai is a great statesman it may be doubted whether he alone is capable of bringing order out of the chaos reigning in the kingdom of the Celestials. The situation is exceedingly trying and none can prophesy what a day may bring forth. The foreign Powers are watching this game of the new Republican Government which, of course, still remains unrecognised. Meanwhile the patriotic party is hostile to the raising of any foreign loan which is thus handicapping the President. Internal loans are certainly to be preferred, but the question is whether patriotism would pour into the coffers of the celestial treasury the many millions badly wanted to place the Empire on a stable footing, with order and peace tolerably well established. Let us hope there may be such both in the middle East and the Far East. That is a consummation to be devoutly wished.

—:o:—

Art and Swadeshi. *Ganesh & Co, Madras.*
(Price Rs. 1.)

This is a volume of addresses and essays by Dr. A. K. Coomaraswami illustrated by 18 photographic reproductions. In *Art and Swadeshi* the author preaches with an apostolic fervour resembling that of John Ruskin the gospel of beauty developed and practised by the Indian people.

THE WORLD OF BOOKS.

[Short Notices only appear in this section.]

A Son of Perdition. *By Fergus Hume. (William Rider and Son, London.)*

This novel by Mr. Fergus Hume belongs to the class of what may be called psychical novels and is dedicated appropriately enough to Mrs. Annie Besant. The work is intended to illustrate the truth of the doctrines of Karma and Re-incarnation and ought therefore to appeal with a special force to Hindus who believe implicitly in these doctrines. Avowedly didactic, the novel serves its purpose in a way, but the author, like all didactic novelists, falls easily into the trap of making his characters not individuals but rather types. Don Pablo is the type of all that is evil and Dr. Eberstein of all that is good. Unfortunately we rarely, if ever, meet with such types in real life. But we turn with relief to some refreshingly individual characters in the story—Mrs. Barrast, Mr. Cane, Mr. Sparrow and others. On the whole, the story is interesting enough and the plot develops easily from situation to situation. The doctrines which the novelist sets forth to teach being good, one certainly must feel the better for having read the novel, however short it may fall of the standard of perfection as a novel.

Vyapara Dharma-Soochike. *By Mr. H. Venkataramaniah. Published by H. N. Rao and Brothers, 264 Chickapet, Bangalore City.*

This is perhaps the first book of its kind in Kanarese. It is a valuable treatise for tradesmen. With the development of trade and the increase of competition in India it has become necessary to change our antiquated methods of business. This handbook sets out in the plain and simple vernacular of the people the latest ideas in business methods.

Evolution And Regeneration By *Henry Proctor F.R.S.I., M.R.A.S.* Published by *L. N. Fowler & Co, London.*

The early chapters of this work, are devoted to a study of the esoteric or inner meaning of Scripture in the light of archaeology and other Sciences. The author considers that the existence of Man prior to Adam can be proved from the Bible itself, that Adam was the progenitor of the Caucasian race only, that people existed long before him who knew metallurgy, music, and other arts, and that the stone and bronze age had passed away before Adam appeared on the scene.

The British Esoteric Society, founded in 1907 is said to be based on the author's practical experience of the extreme importance of chastity and the conservation of the vital fluid, and the doctrines and recommendations of this society form the topic of the latter part of the book. There are chapters dealing with deep breathing exercises, rules of diet, the fast cure, continence, and other allied topics. And various biblical doctrines and incidents are explained as possessing an inner meaning differing from the apparent ones.

Swami Ram Tirtha. *Ganesh & Co, Madras Re 1.*

Messrs Ganesh and Co., Publishers, Madras, have brought out a second volume of the Life and Teachings of the late Swami Ram Tirtha. The writings of Swami Ram breathe the true spirit of Vedanta and are marked by an originality, freedom from conventionality and individuality of presentation that give them a force all their own. The present publishers issued a few years ago the first volume of Swami Ram which has already run three editions. Encouraged by the popularity the book has achieved and actuated by the desire to spread the Teachings of Swami Ram Tirtha, the publishers have now issued a companion volume. The book is printed on antique paper and contains four portraits of the Swami.

Thirteen. By *E. Temple Thurston*, "Bell's Indian Library."

The title of this book is rather threatening. It calls up visions of something dreadful, bewitching, mysterious, desperate, fatal and what not. It is an appropriate title for a sensational novel. But nobody need be afraid of it now. For it is after all the name of a book containing thirteen short stories delightfully told. The French model of the short story has been successfully copied in Germany, Russia and Italy. England does not lag behind them. Mr. Thurston has already earned a name as the author of some very precious and telling stories. This volume completely fulfils the expectation. Each story is complete in itself: it has no reference to the previous or succeeding one. And each story expresses one incident, one situation, one emotion. This method of expressing artistically one moment of experience and conducting the interest so as to turn on a single fact or emotion is effectively done by the author. It is a gifted man that can tell a tale aright. And Mr. Thurston has done his part well.

Women's Suffrage By *M. G. Fawcett Messrs. T. C. and E. C. Jack, London and Edinburgh*

Much has been said for and against the Women's Suffrage movement, chiefly against, by those who, through indifference or prejudice, are ignorant of the real meaning of the struggle. Like all movements that the world has known, movements going to the root of human society, many can talk, but few, very few, have any real knowledge. No one, however, can be ignorant after reading Mrs. Fawcett's little book. It is invaluable, covering, in a clear, concise, unbiased and attractive manner, the whole of the movement, which began in England in the year 1792. The whole can be read in a couple of hours, and with advantage by the believer, the indifferent, and the unbeliever alike.

A Primer of Indian Botany. *P. F. Fyson, B.A., F.L.S.* [*The Christian Literature Society for India, Madras Re. 1.*]

This neatly got up book of 160 pages is mainly intended for beginners in secondary schools to be used with illustrative material before them and the aim of the author has been to make the study of plants education and to avoid the mere imparting of facts. The book is divided into two parts, the first consisting of twenty-two chapters, while the second is devoted to systematic botany, and the author has always used the simplest language so that the beginner may be better able to appreciate the infinite subtlety of the simplest things in Nature. This excellent handbook which contains 51 newly-executed figures is sure to become immensely popular in all secondary schools.

Character Training. *By E. L. Cabot; revised by E. Eyles. 3s. 6d. net. George G. Harrap and Co. London.*

Originally written by E. L. Cabot, it has been adapted to English Schools. It is intended to impress moral ideas on the young by a series of stories, most of them in prose and the rest in poetry. They are well-chosen and easily understood by the young. Actual incidents from the lives of men such as that of Abraham Lincoln illustrating kindness to animals; the quarrel between "the Pig and the Hare," in poetry to show their later mutual adjustment and life in peace, the choice between virtue and vice are only a few out of the examples of beautiful stories nicely told.

Whether in India or Europe and America, it is again of questionable utility to set apart periods in the time-table for religious or moral instruction. It ought to form a part of the whole course of teaching in language and history. When we see spectacles used by young boys in Indian schools, we ought to recommend only books so beautifully printed.

Diary of the Month, July—August 1912.

—:—:—

July 23. Under the auspices of the Empire Press Union a deputation of representative Newspaper proprietors including Dr. Stanley Reed of *The Times of India* (Bombay) Mr. Wade of the *Englishman*, (Calcutta) and others waited on Mr. Herbert Samuel, the Post Master General to ask for the common registration of all the papers in the Empire and for a uniform rate for newspapers within the Empire.

July 24. The P. and O. Steamer *Malca* to-day shipped £ 110,000 gold for India.

July 25. A public meeting was held in Calcutta to consider the decision of the Privy Council in the Mymensingh case and Lord Crewe's interpretation on the Government of India Despatch.

July 26. The Calcutta Committee has addressed a note to the Institute of Journalists in London on Lord Crewe's reference to the English papers of Calcutta for consideration at the Annual Conference.

July 27. Lord Selborne in his inaugural address on the British Empire laid stress on the complexity of the Indian problem.

July 28. The Mikado of Japan is fast sinking in health. Tokio presents a pathetic sight, the people thronging the palace and the temples with prayers for his recovery.

July 29. It is announced that the Mikado is dead. The succession of the Crown Prince has been proclaimed.

July 30. In the House of Commons to-day Mr. Montagu introduced the Indian Budget in a lengthy speech and announced the names of the members of the Public Service Commission. The members of the Commission are Lord Islington, (Chairman,) Lord Ronaldshay, Sir Murray Hammick, Sir Theodore Morison, Sir Valentine Chirol, Mr. F. G. Sly, C. I. S., Mr. Mahadev Bhaskar Chaudal (Member of the Bombay Executive Council), Mr. Gokhale, Hon

Mr. Madge, (Viceroy's Council,) Mr. Justice Abdur Rahim, (of the Madras High Court,) Mr. Ramsay Macdonald and Mr. Laurens Fisher.

July 31. The death is announced of Mr. A. O. Hurre, the Father of the Indian National Congress.

August 1. The *Times* vigorously assails the appointment of Mr Mallet as Secretary for Indian students and the inclusion of Mr. Ramsay Macdonald in the Royal Commission.

August 2. It is announced that Mr. Young-husband's scheme of Khairpur Scholarship is now complete, the requisite fund having been collected.

August 3. The 4th annual meeting of the Bengal Depressed Classes mission held its sitting in Calcutta with Mr. Justice Choudhury in the chair.

August 4. The Commissioner of Police, Calcutta has issued orders prohibiting the celebration of the Boycott anniversary.

August 5. A rumour is afloat that Lord Morley will retire shortly and that Lord Crews is feeling the strain of the India Office.

August 6. In the House of Commons to-day Mr. Asquith declined to reconsider the appointment of Mr. Ramsay Macdonald in the Royal Commission.

August 7. It is understood that Mr Justice Chandavarkar will be appointed a Member of the Bombay Executive Council.

August 8. The Muslim Educational Conference at Poona concluded its sittings to-day after passing several important resolutions.

August 9. The Mill Strikes at Upper Hooghly Jute Mills and Bengal Cotton Mills have ended. The workmen have been reinstated.

August 10. The earthquake shock in Turkey was most severe on the shore of the Sea of Marmora. Great loss of life and property is reported.

August 11. The Rajah of Mahmudabad and the Lucknow Municipality gave Farewell addresses

to Sir John Hewett to which the latter replied sympathetically.

August 12. The latest estimate of the people killed in the earthquake in Turkey is reported to be 1200. Fifteen thousand are said to be homeless.

August 13. The *Punjab Advocate*, a vernacular newspaper published at Mianwali, has been called upon by the Punjab Government to furnish a security of Rs 2,000.

August 14. This evening the Chief Justice, the Judges and the Senior Barristers met in the central hall of the High Court of Bombay to celebrate the Jubilee of its establishment.

August 15. The Diwan of Travancore announced to the Durbar the plans and estimates of the extension of the State Railway from Quilon to Trivandrum.

August 16. The death is announced of Captain Stiffe, late of the Royal Indian Marine.

August 17. The Senate at Washington has adopted the Panama Canal Bill as modified by the Conference of the two Houses.

August 18. A meeting was held in Poona this evening to concert measures to give a public entertainment to Their Excellencies Sir George and Lady Clarke prior to their departure.

August 19. It is understood that the All-India Sanitary Conference will be held at Madras early in November.

August 20. His Excellency the Governor of Bombay laid the foundation stones of the Emperor George's Hall and Sir George Clarke Library in connection with the Guzerat College, Ahmedabad.

August 21. Mr. Chimulal Lalabhoj died to day of typhoid fever at his residence in Ahmedabad.

August 22. It is announced that Mr. Montagu, the Under-Secretary of State for India arrives at Bombay on the 18th October with his brother Dr. Lionel and his Secretary Mr. Horace Peel.

TOPICS FROM PERIODICALS.

The Future of India.

Mr. Everard Digby writes on the above subject to the *Asiatic Quarterly Review* for July. The impermanence of British rule in India has for long been in the minds of certain distinguished Englishmen. That gloomy thought has been awakened from a study of history and particularly the history of India. In a country where sudden outbreaks and violent conspiracies were so common in the past it is not strange that such pessimistic forecasts are often made with regards to the future of India. The writer says that up to the middle of the last century such a belief had much that was valid in it. But now the conditions have thoroughly changed. India is not as she was of old.

With the years that have followed, certain changes have taken place which are about to lift the country out of the old groove in which affairs happened and recurred with a regularity almost as invariable as the seasons. It is because this is overlooked that there is nowadays so much prophesying of evil for the future. India is entering the stage of modern State building. If we draw any conclusion based solely upon the semi-feudal conditions that exist at present, or if we believe that the country will attempt to show the instability of a South American Republic, we are likely in each case to be equally wrong. For since India is becoming modernized we must make due allowance for the action of distinctively modern forces. When we have set up a model of the man with the gun against the man with the bomb, we may be speaking of the actual warfare to be waged in one small corner of the field. But we overlook the areas where co-operation and fellow-feeling are forming a coalescence stronger than what the disruptive actions will be able to overcome.

The future of India does not walk insecurely between bombs on the one hand and unprincipled exploitation of the people on the other. The future may possibly be less adventurous, but more to its permanent benefit. It may be argued that the conflict between the rulers and the ruled in India will always present a racial struggle of lasting potency. It is not so. For the questions that more and more gain prominence in this country are likely to divert any

such racial animosity into channels of more pressing concern.

There is, firstly, the heavy and almost overpowering work which lies ahead in the raising and improvement of the lower and poorer classes, in which all who are educated, whatever their race, will more or less share. There is, secondly, the exactly contrary influence of the conservative forces, which will fight together to prevent the widening of the horizon of these people. And there is, thirdly, the attractive force of a great idea, that idea being the modern conception of an Empire as a partially decentralized, and not wholly centralized, consolidation of nations, in which country can fit itself into country and work with its companions, without the too-present sense of over-lordship and subjection. For these two influences, after the initial benefit which often accrues from them, act in the third and fourth generations as cankers sapping the strength of the conqueror even more unfailingly than of the conquered.

A fourth factor is the Hindu Muslim Problem. This question has however received the due attention of all India and is every day gaining in importance. It is more and more recognised by both the communities that their co-operation is a requisite factor in the making of modern India.

After all, says the writer, the British Empire is the biggest fact in the world to-day. It is a consideration which the Englishman nowadays is liable to overlook under alternate waves of self-depreciation and over laudation. He concludes:—

The British Empire is the only consolidation of the present day which combines on a large scale races of two colours under one system of government. It is the supreme laboratory in which is being attempted the experiment of organising immissible societies in one organization. Should that experiment succeed to the equal satisfaction of both parties, a great battle will have been gained in the cause of the world's peace, and in the prevention of a future in which the globe will be divided into free and semi-servile races; occasionally checkered by fruitless and sanguinary servile risings. With the development of the world we are seeing more plainly every day the narrowness and instability of the nineteenth-century ideal of the multiplication of little nations. Such organisations lead to waste, limitation, and the prospect of continual wars and dictatorships. Instead we are working to the ideal of forming the biggest aggregations of people that the organizing ability of mankind can admit. To throw away that ideal in connection with India, or to base it on force rather than consent, will be to perpetuate the divisions of mankind, and to lead us a step nearer to the era of race wars, which would be as destructive to Asia as the religious wars of the seventeenth century were to Europe.

Religion and Economic Progress.

The *Wealth of India* publishes a valuable symposium on the question, how far religion is responsible for the slow growth of the material prosperity of this country. Superficial observers of Indian life seldom fail to ascribe our lack of capacity for business to the puritanical character of the religion we follow. Dr. Sir S. Subrahmanya Aiyar Kt., C.I.E., who leads the first instalment of this series remarks in concluding his observations:—

It seems to me wrong, with reference to the existing state of material progress, to cast any blame on the religion. And in these columns devoted to discussions of matters connected with the wealth of India, I think I may without presumption claim for that religion the character of a national asset of inestimable value. For, I hold that, if its dictates are rightly understood and lived up to, that would pave the way to a peace and happiness which no amount of riches could confer. No doubt, erroneous notions as to those dictates prevail—a state of things of course not peculiar to this particular religion. But to condemn it because it is misunderstood would be, to speak mildly, indeed as queer as condemning sanitary science because its directions are hourly violated, and morality because moral precepts are day after day ignored in practical life.

The next note is from Dewan Bahadur K. Krishnaswami Rao, C.I.E. In a luminous analysis of the question he demonstrates the importance of religion in any scheme of corporate life and discusses the utility of the caste system as an economic arrangement.

He says that in the past when the observance of the Hindu religion was much more strict than it is now, Indian civilization stood very high. India then held a conspicuous position in arts, industries and commerce. Hence he believes that religion has little to do with the rise or fall of a nation's material resources. He has diagnosed the causes of economic depression in India with true insight and points out the real obstacles to material prosperity in the following words:—

The real obstacles to the economic progress of India are the weakness of the spirit of enterprise and co-operation, want of punctuality and mutual confidence, absence of technical knowledge, timidity of investment, lack of business habits, abnormal fear of failure, tardy performance of obligations incurred, and above all, strong foreign competition.

Colour Prejudice.

Under this head a writer who calls himself "Bacillus" contributes a valuable paper to the July number of *East and West*. He sums up the factors underlying "Colour Prejudice" as follows:—

(i) The inherent antipathy of difference of nationality

(ii) The greater cheapness of the cost of living to "coloured" people, or in other words, their ability and willingness to work for less pay than "white" people are able and willing to work for.

(iii) The ability which "coloured" people are showing of doing as well as and better than, "white" people in various walks of life.

(iv) The belief inherent in "white" people that they are superior by virtue of their whiteness to "coloured" people.

(v) The resentment of this belief by "coloured" people.

(vi) The failings which are characteristic of "coloured people" —

(a) Wrong methods of resentment.

(b) Impatience of results

(c) Want of cohesion.

He then examines each of these factors in turn and exemplifies them with illustrations. He gives a warning and a lesson to both the white and the coloured peoples. *Tolerance among the Whites* and mere cohesion among the coloured are the only needs to better the present condition of the race. Both have their rights and their obligations. They must realise it and work for the amelioration of the depressed part of mankind. He concludes —

I have tried in this brief sketch to show something of the mutual responsibilities which "white" and "coloured" peoples owe to themselves and to each other, for the experience of men and things show clearly that this problem of the clash of the "white" and the "coloured" races is the greatest which humanity will ever have to solve.

Solved it must be, and solved it can be only either by bitter strife or by honest, consistent, manly effort.

The Wealth of the Nation.

The July number of the *Modern Review* has a very inspiring article on the subject by Mr. Har Dayal, M.A. The writer says that the wealth of the world consists in the intellect and the character of its men and women, that this moral and mental capital leads to all happiness and that its proper investment should be the chief care of all noble souls. Applying this general principle to India, he says:—

The people of India have an abundance of mental and moral power. They are in this respect on a par with the noblest Caucasian races. The Hindus belong to the Aryan division of the human family and inherit its earnestness, inventiveness and social genius. Modern India has produced many distinguished metaphysicians, orators, novelists, journalists, scientists and mathematicians and could achieve still greater triumphs in this field, if her millions were educated in any sense of the word.

As regards moral power he continues:—

It is not much in evidence, as far as a superficial observer can judge. But a more careful survey reveals hidden springs of moral force which have not ever been tapped. India is sadly deficient in moral strength, but, as we shall see by and by her small stock is all wasted and misused by persons wanting in judgment and foresight. The world can never have too much of character, and India has in fact too little of it. But that little should be spent for worthy objects. We are more foolish than selfish, more demented than depraved.

He then discusses the use to which India puts her intellect and moral power and finds that she employs the first in (i) Prostitution (ii) Philosophy (iii) Amusement; and she makes about

as bad a use of the latter as of her mental force. Contemplation in isolation is one favourite method of spending time adopted by India's noblest sons. They rise above petty selfish desires and ambitions, but fall into the vacuous abyss of contemplation and inaction.

Another mode of wasting moral power is mysticism.

Many sects are devoted to the worship of Krishna, Rama and other deities. Parties of devotees would sing hymns, to the accompaniment of music, and work themselves up to a high pitch of emotional excitement. They would weep and dance in rapture, singing the names of the Lord. They would forget all worldly cares and duties.

He concludes with a pathetic appeal to the young men of India to follow the footsteps of the savants of Western civilization and to cast aside the old world notions of life and destiny which have marred the progress of India these many centuries.

The Average Boy.

The average boy in spite of his being trained by the million in schools, elementary and secondary, still presents a puzzling problem to solve with his mind unexplored and his energy running to waste. In *Science Progress* for April, Mr. Archer Vaessl, Science master of Harrow School points out the source of the general ignorance of the average boy and our inability to bring out the best in him. He suggests a method by which Science and the average boy may be brought into mutually helpful relations:—

All through their school career the majority of boys are taught with reference to an ideal far beyond their capacity, and methods suitable to this ideal are in vogue. The ideal, of course, is the production of such erudite classical stylists or embryo pure mathematicians as may win scholarships at the Universities.

The result is that work for the average boy, instead of depending on his reasoning power and stimulating his mental self-reliance, is reduced to mere memorizing. Consequently there is a loss of plasticity and a lack of resourcefulness which are highly detrimental to him in earning his own living.

But plasticity, resourcefulness, and self-reliance are exactly the necessary attributes. Hence it becomes more and more important that science masters by their methods should seek to strengthen and not thwart these characteristics as far as possible.

He then outlines a scheme of education which he says is the most practical under the existing circumstances and gives the most stimulating interest in Science.

Experimental work bearing on whatever problem may be under investigation is done throughout by the boy himself, and this is accompanied by occasional demonstration, information giving, summarising, and heuristic lectures. The practical work is taken in small divisions which make a form of heuristic seminar possible. The boys begin with simple Natural History and the work of great biologists such as Darwin, Pasteur, Lister. The matter is not taken as a "subject," but simple chemical and physical phenomena necessary to the issue are considered; thus the presence of an atmosphere, the nature of oxidation, respiration and combustion are investigated experimentally as they occur. It is neither chemistry nor physics nor biology, but all these "subjects" are drawn upon as necessary.

In 120 hours a boy can get a good deal more scientific information and rather more scientific training than is possible in the like time for his examination-ridden brother of similar capacity. A boy so trained will probably be ploughed in most conventional science examinations for boys of his age. But the writer firmly believes that he would keep his mental plasticity and his interest in scientific subjects and respond to his environment more intelligently than do many average boys differently trained.

International Law and Subject Races

The Journal of the Society of Comparative Legislation reproduces the paper contributed by Sir John Macdonell, C. B. to the first Universal Races Congress on the subject of International Law. It must be understood that International arbitration does not touch many internal and domestic questions profoundly interesting to races which are not dominant. For instance, the condition of the Jews in Russia and Poland, the Poles under Russian rule; the Roumanians in Hungary; the Finns in Russia, the Macedonians and Armenians in Turkey; the East Indians in South Africa; the natives of the Congo State under Belgian rule—International Arbitration does not help to solve, except very remotely and indirectly, the problems which these names recall. *To day each State says, and will long continue to say, "I must be master in my own house"* That position must be accepted—at all events for the time. Sir John therefore turns to the question, how far, if at all, is International Law applicable to the relations between subject and dominant, between civilised and uncivilised races. *Opinions on this head are very divergent. The writer cites Mill's view of the case. John Stuart Mill said:—*

*To suppose that the same international customs, and the same rules of international morality, can obtain between one civilised nation and another, and between civilised nations and barbarians, is a grave error, and one which no statesman can fall into, however it may be with those who, from a safe and unresponsible position, criticise statesmen. Among many reasons why the same rules cannot be applicable to situations so different, the following are among the most important. In the first place the rules of ordinary international morality imply reciprocity. But barbarians will not reciprocate. They cannot be depended on for observing any rules. Their minds are not capable of so great an effort, nor their will sufficiently under the influence of distant motives. In the next place nations which are still barbarous have not got beyond the period during which it is likely to be for their benefit that they should be conquered and held in subjection by foreigners. Independence and nationality, so essential to the due growth and development of a people further advanced in improvement, are generally impediments to them. . . . The only moral laws for the relation between a civilised and a barbarous Government are the universal rules of morality between man and man (*Dissertations*, vi. p. 167).*

After quoting some observations from Bluntchli to the same effect, Sir John Macdonell deprecates that there is not a clear line of separation between civilised and barbarous nations in the passages cited. Very often they differ from each other by small degrees. What is the test of superiority?

There is the often suggested test of proficiency in war according to which the Turks some centuries ago were probably supreme among all nations, the Italians, contemporaries of Michael Angelo and Leonardo da Vinci, not excepted. There is the test of wealth, a test the justice of which, if applied to individuals, would be denied. There is the test of morality, the existence of a legal moral code and conformity of conduct thereto; a test the application of which, if possible, might lead to startling results. Nor is the distinction between the progressive and non-progressive races so clear to modern ethnologists as it was to those who knew little. The so-called stationary races are often merely those whose changes are unrecorded. As Professor Royce justly remarks, this test has never been so fairly applied by civilised nations as to give exact results. The application of a well accepted test is impossible. The superiority for which writers such as Gobineau and Houston Chamberlain claim will never be conceded. But what is clear is that the world would be the poorer if one type of civilisation were to be universal, what we cannot be sure of is that an unpromising race, if left to itself, may not be the starting-point of a development which will enrich mankind.

After considering the opinions of various scholars the writer says that some principles are commonly recognised—principles that determine the conduct of civilised nations among themselves and with those of their less fortunate brethren. They have not as yet been codified into a system of law but the fact remains that they are tacitly understood to be binding in them. That there should be less of the "intolerance of civilization," that minor races should retain their means of existence, that the major ones should stand as faithful guardians, that there should be some respect for the law and manners of the less gifted races, that there should be mutual understanding and mutual sympathy by more frequent meetings—these and other such facts are clearly recognized by all.

The writer is summing up the suggestions says:—
Closely connected with, if not a part of, International Law is a group of duties on the part of dominant races to those under their control or influence. These duties, now imperfectly recognised, may be made clearer, they may be enlarged, the observance of them may be made stricter by wise co-operation. Fostering and preserving diversity of race, we may attain to something like unity in spirit and policy.

Muslims and Non-Muslims

The Hon. Mr. Justice Abdur Rahim discusses this question in a very illuminating article in the July number of the *Hindustan Review*.

The relations of the Muslims towards the non-Muslims are mainly determined on the basis whether the country or state of the latter is to be regarded as Darul-Harb literally territory of war. There can be no question but that a country governed by a Muslim ruler according to the laws of the Islamic religion, is Darul Islam. Nor can there be any doubt that a country under a non-Muslim Government in which a Mahomedan cannot live with personal security and freedom to perform his religious duties, is Darul Harb. But it does not follow that a self-governing Muslim country passing into the hands of non-Muslim conquerors, or of the Dhimmies rising against Muslim Government, becomes by that fact alone Darul Harb. It turns into Darul Harb if it fulfils three conditions, namely, that the laws and regulations of the non-Muslims be enforced there, that it should be surrounded by other countries answering the description of Darul Harb, without any country of the description of Darul Islam being contiguous to it, and if no Muslim or Dhimmi, that is, a non-Muslim subject of a Muslim state, can live there, in the same security as under the previous Muslim Government.

Now one of the tests, as to whether a country should be treated as a Darul Harb or Darul Islam is, whether congregational prayers during Fridays and Ids shows be held in the country. The learned writer then discusses under what condition the holding of Friday prayers is allowed by the Mahomedan law. He concludes by explaining the two aspects of Mahomedan law. He says:—

As I have had occasion to point out, the Mahomedan Law, generally speaking, has two sides. In its worldly aspect, it is enforceable by the court; and in its spiritual aspect, it affects the conscience of every individual Muslim. The head of the Muslim state can obviously enforce Mahomedan law only within his own jurisdiction. A Mahomedan living within the territory of non-Muslims is required to conform, as far as is practicable for him to do so, to the rules and injunctions of the Mahomedan law and religion. If he violates them, he incurs religious guilt, and when he finds that he cannot stay in a particular non-Muslim country with safety of person and property nor discharge his religious duties there, he is expected to retire to his own state. If such a person finds that the non-Muslim Government actually interferes with his property and reduces his children to slavery or suffers it to be done, or is guilty of other similar acts of oppression, he would be justified in interfering with the lives and properties of the non-Muslim inhabitants of the place. But otherwise, he must forbear from interfering with the non-Muslim Government and inhabitants of the country of his adoption, as that would be an act of perfidy on his part which the law absolutely forbids.

European Politics and Asiatic Aspiration.

In the course of an article on the above subject in the *National Monthly* of Ceylon Mr. Lionell A. Mendis gives the following observations:—

The spirit of the Asiatic Renaissance is veritably the spirit of progress—for Asia has decided to be no more asleep. It is the spirit of Truth—for Asia seeks to know and learn from the outer world. It is the spirit of Life and Light, for it means the development of all that is highest and best in Asia and the realization of the highest manhood by her peoples.

It is best for both East and West that the West should understand that this New Spirit in Asia must and will have its fulfilment; that the day must soon come when Europe should realise that "a nation can no more ultimately justify the ownership of other nations than a man can justify the ownership of other men" (Dr. A. K. Comararawamy), that it will not do to say with Dr. Dillon: "Persian Reforms are the work of a few rebel Caucasian filibusters, Reforms in Turkey mean no more than Hamidism without Hamid, and Reforms in China but a new Chinese Puzzle, all bound to fail, because "Oriental nations are unfitted by ages of political thralldom, by religious tenets, and by a feudal cast of mind which has become second nature, for that form of self-government which goes by the name of Parliamentary regime," or (as he applies it in particular to Persia), "They lack energy, self-help, moral staying powers, in the word the sum of those virile qualities—which we sometimes designate as back-bone—which sustain men and nations in hours of danger and suffering." Statements such as the above are a blasphemy on the Almighty, in condemning half his creation with deficiencies that are not there; "also that if the British Government were deliberately to oppose national aspirations, then undoubtedly the (National) movement would become wholly anti-British, and would finally sweep away men who had betrayed their God-given trust" (A. G. Fraser, 1911).

And yet, though the New spirit in Asia must in the end be triumphant, will Europe foster it, or will Europe attempt to stifle it? On their answer to this question depends the progress of the world. There are however, says Mr. Lionell A. Mendis.

Three strong movements which are daily growing in strength and on which Asia may look with some interest as likely allies in days to come: (1) Socialism, a movement of the masses for the masses, resting on the brotherhood of man, and opposed to war. (2) Women in Politics: women, risen to political power, will bring to every question the rights and wrongs of an act, and not merely the expediency of it. She will represent the softer side of Western nature and take away from politics its hard, inhuman features. (3) Missionary aggression: there is a strong movement of missionary enterprise in the world to-day. In ten years, the missionary forces throughout the world will have doubled or trebled in number. If the men who come to Asia are true to their God, they will not be false to man, and therefore to Asia, in the hour of her need.

Buddhism in Japan.

The *Japanese Magazine* publishes an article entitled "what Buddhism has done for Japan." After briefly sketching the historical progress of Buddhism and its bearing on the life of the people the writer proceeds to enquire what influence the religion has exercised on the genius of the Japanese civilization. He says that that influence has been greater in Japan than in China or India. The effect of that religion on Japan may be twofold first in the new ideas and manners introduced into that country and secondly in the developments it caused in Japanese ideas of religion, culture and manners in general.

Among the more conspicuous influences of Buddhism in Japan may be mentioned its effect on *Sculpture and metal work*. In the work of Embroidery, too, Buddhism had an equally far reaching influence on Japanese Art.

History relates that in the thirteenth year of the Empress Suiko a Buddhist image was made in embroidery by a Japanese artist. This may have been the beginning of that long succession of highly wrought and beautiful work for which Japan has become justly famous. The making of Buddhist robes and hangings also encouraged the art. On the other hand the amount of decorative work necessary in Buddhist temples had a direct effect upon Japanese painting, so that in Japan as elsewhere religion may be said to have been the mother of Art.

Then again the effect of Buddhist doctrine and culture on Japanese civilization is most conspicuous in the general character of the people's education and culture. In fact, says the writer —

We owe our first incitement to general education to the good influence of Buddhism. We received our philosophy and literary inspiration from China, and our authorities continued to send students there to draw, and refresh themselves, from the fountain head of learning and thought, but in later times, this good custom fell into neglect, and then Buddhism fell into the breach and did a very important and necessary work for the education of our people. While Japan was in the hands of the military class and subjected to almost constant civil war, education became entirely neglected by the government. In this dark period, the Buddhist monasteries were centres of learning, and the Buddhist temples, with their priests of culture and education, were a light shining in a dark place.

The effect of this form of education to which the nation had been so long subjected, was a *spirit of toleration* which is perhaps the most distinguish-

ing feature of the Japanese civilization. The writer says:—

Buddhism was the most tolerant of religions, welcoming our national gods into its pantheon on equal terms, and honouring our ancient customs with due deference to our prejudices and tastes. Some of the sects were extremely narrow and bigoted, but the general influence of the religion was one of toleration and magnanimity. Nor was it a toleration that could be identified with mere religious indifference. Its root idea was, and is, that at heart all religion is one. The foreign missionary teaching in Japan, who does not take this for granted, will meet with many surprises and disappointments. Many, or most, of our people belong to both Buddhism and Shinto, an attitude in which they see no more incongruity than in a man belonging to various secret orders, like Odd-fellows or Masons, the purpose of all being good.

'To reach the mountain's crest are many ways;
But all meet there beneath the moon's bright rays
From yonder tow'ring peak her smile serene,
Reveals the beauty of the native scene'

These lines suggest the spirit with which Buddhism inspired the Japanese mind. It is now almost constitutionally impossible for them to change it. It may, however, be contended that Buddhism was an active agent in the days of the persecution of the Christians. The writer defends the Japanese attitude in the following words:—

Let it be understood that it was not as Christians *per se* that the persecution was visited on the adherents of the foreign religion, but as enemies of the state, the authorities and the Buddhists believed that Christianity was a scheme of European governments to pave the way for the invasion and subjection of Japan to a foreign yoke. It was not so much as Buddhists that the temples were active in the campaign of eradication, but as Japanese subjects in defence of their country. Otherwise the persecution could only be looked upon as the insane rage of inhuman devils. It was no more than was the Christian persecutions of fellow-Christians in Europe. In fact our persecution were more rational because patriotic in origin, while the burnings and scourgings and tortures of Medieval Europe were the outcome of religious bigotry, and an overbearing assumption that the perpetrators were the viceregents of the Almighty.

Lastly the Japanese *Love of Nature* is the direct result of Buddhism and it pervades their art and literature.

The Buddhist temples usually occupied sites commanding the most beautiful and imposing views of natural scenery, and sometimes to get the delightful view one had, as one still has, to climb long flights of steps or travel far into some rural spot.

Thus the writer illustrates that almost every aspect of Japanese life and civilization is tinged with the influence of Buddhism.

Indian Art in China.

Dr. A. K. Coomaraswami, D. Sc. traces the influence of Indian Art in China in the current number of the *Dawn Magazine*. From the time of the introduction of Buddhism in that land, which is generally reckoned to be 65 A. D., the influence of the ethics and art of India in China has been paramount. The first two Buddhist Missions to China only paved the way to the triumphant success of the third which was able to do effective work in the service of the great religion. Early in 148 A. D. the mission from Parthia established a regular organization in the Cathay, which was to convert the whole country to the religion of the Enlightened One. But the effect of the mission in the Art of China was even more than in the other aspects of the people's life.

Chinese architecture goes back to Indian sources. The symbolism of the pagoda, for instance, is Indian. The four-sided base has representations of the guardians of the four quarters, the octagonal centre representing the Tusita heavens has Indra, Agni, etc., as guardians, while the uppermost storey represents the heaven of the Dhyan Buddhas. The stone toran of Indian stupas is the original form from which both the Chinese *pailu* and Japanese torii arches are derived.

The influence of Indian on Chinese architecture was not confined to the early period but lasted up till the fifteenth century at least. In the reign of Yung Lo (1403-1421), a Hindu Pandit came to Peking with golden images and a model of the *vajrasana* at Buddha-Gaya. A temple was built for the images on the model of the *vajrasana*, and finished in 1473. An inscription states that it reproduced in every detail the Indian original.

Again we are told that in the fifth century artisans went to China from the Yueh-Ti, an Indo-Scythian kingdom on the North-Western frontiers of India, and taught the Chinese the art of making different kinds of coloured glass.

He concludes in the following words :—

It may be remarked here that while a great deal of Chinese literature about painters, more or less biographical, is preserved, much of it consists rather of folklore than true personal history, and the folklore is largely of Indian origin.

Without going into further details it will be clear even to one who studies the matter no further than this short abstract permits, that the influence of Indian on Chinese and Japanese art during the period 400 to 900 A.D., was profound and far-reaching.

The King's Visit to India.

In the July number of the quarterly organ *The East and the West* Rev. O. F. Andrews discourses on the Missionary bearing of the King's Announcement at Delhi. He sums up the two principal factors of the announcement as follows :—

A. The growth of provincial Self-Government.

B. The Centre of Imperial Government at Delhi.

After briefly explaining the two factors of the announcement, he says that two important points strike him more clearly every year viz, The growing nationhood of Bengal and the temperamental difference between North and South India.

He then sketches the plan of future missionary work in India. In any reconstruction of Christian organisation, he says that Bengal, North India, and South India must sooner or later be treated separately as far as the work of the Church is concerned. With this re-organization for effective work he proceeds to indicate the line of work that the mission should undertake. He appeals for greater co-operation and energy on the part of the Churches so that they may embark on the scheme he suggests. His suggestion is as follows :—

The most hopeful sphere has been found to lie in higher educational work. It would appear to me personally to be wise to invite the new Missions, which will now arrive, to co-operate mainly on this educational side. The missionaries who would come to Delhi for such educational work would naturally be keen and able missionary thinkers. They would be the best men, therefore, to set forth before the very able Government officials the point of view of their own Missions, and the missionary cause as a whole.

The Anglican Mission in Delhi has already approached the imperial Government, with a view to obtaining a large central site in the new city for a men's residential college. The Baptist Mission has also approached the Government for a site for a women's educational institute, which may develop into a college. Each scheme is of such a character that expansion would be possible without loss of intensity in missionary educational method. The form of expansion would be by hostels established in connection with the central institutions. I believe myself that here, both on the men's and women's side, is the most useful field for that necessary co-operation in the new capital which modern missionary method demands.

Provincial Finance.

This is the subject of an elaborate paper read by Mr. N. Gopalaswami Aiyangar before the South Indian Association at the Ranade Library Hall, Mysapore. The quarterly organ of the association publishes a full text of the address. The Indian financial system presents several features of great interest and importance both to students of the science of finance and to practical politicians, not the least important part of which is that position of India's financial machinery which may be broadly designated by the term "Provincial Finance." In reviewing the whole course of the financial arrangement in India he says that the present system of Provincial finance has been evolved by slow gradations during the last 40 years—

The practical impossibility of directing the finances of a continent like India from one centre was recognised soon after the transfer of the Government of India from the Company to the Crown. A forerunner of the measures of decentralisation which took final shape 10 years later was given by Mr Samuel Laing in his financial statement for the year 1861-62. The necessity for finding more money for Provincial Public Works, the difficulty of fixing upon a uniform and unobjectionable Imperial tax, for raising the additional revenue, the desirability of enabling Local Governments to raise considerable sums by local taxes for local objects—these were the financial reasons which induced him to put forward a scheme which, in its main outlines, is characterised by breadth of view. In his view, decentralisation was not limited to the narrow object of giving relief to the Imperial Exchequer; he was so optimistic as to predict the growth of financial autonomy of a permanent type in the Local Governments. He desired to place no limit on the powers of Local Governments to impose additional taxation except that every such proposal should be sanctioned by the Governor General in Council and the Legislative Council, in order that they might insure that it was not inconsistent with Imperial taxation or with Imperial policy. He would have enacted Local budgets and subjected them to the scrutiny of the Local Legislative Councils. He intended the scheme to foster that "spirit of Local self help and self-guidance, which is at the bottom of a nation's greatness."

He then refers to the great work of overhauling the financial arrangements that Lord Mayo undertook. By the resolution in this subject aimed by him, on the 14th December 1870, a new system of financial administration was inaugurated which was to take effect from the 1st of April following. Till then the whole of the revenue and

expenditure was controlled by the Government of India though indeed the Provincial Governments were allowed considerable administrative powers. All expenditure had to be under the authority of the Governor General in Council, and the Provincial Governments could not incur any fresh expenditure though curiously enough, the Supreme Government sanctioned such measures that involved enormous expenditure. Indeed the Government of India was unable to realise the defect and the inefficiency of this method of financial administration. Lord Mayo proposed to remedy this state of things by so investing the Provincial Governments with financial powers as to make it their business to effect economies and to improve local sources of revenue. The speaker then passes on to the altered schemes of Sir J. Strachey and the work of the Finance Committee in turn, discourses on the Permanent Settlements of 1801 and 1811 and pleads for more elasticity of finance and separation of estimates. He concludes his thoughtful address in the following words:—

The Legislative Assembly of India—both Imperial and Provincial—are subordinate lawmaking bodies and their powers of taxation are undefined. Practically, no limit appears to be recognised to the power of the Imperial Legislative Council to impose taxation. The Provincial Councils have no authority to impose additional taxation without previous sanction by the Government of India. The local and municipal bodies have, however, their functions and sources of revenue placed on a legislative basis. The experience and practice of Governments on the Continent would seem to suggest that Local Governments may safely be entrusted with the powers of imposing by legislation certain additional taxes or additions, subject to a maximum percentage, to the Imperial taxes. The existence of the Provincial Legislative Councils with a non-official majority is sufficient guarantee that additional taxation will be imposed with the consent of the tax-payers. As all taxation is imposed by the enactment of a law, the Governor-General in Council and the Secretary of State can check extravagant expenditure in and excessive provincial taxation by the legislative veto they possess. At present the provincial Governments are the delegates of the Government of India and possess no financial powers apart from such delegation. A definition by statute of their functions and sources of revenue would give them a legal status and stability and obviate the necessity for making any Settlements at all between them and the Imperial Government.

QUESTIONS OF IMPORTANCE.

Indians in British Colonies.

At a meeting in Bombay on the 31st July with Sir Jamset Jeejeebhoy in the chair the following memorial was adopted for presentation to H. E. the Viceroy :—

For many years the position of His Majesty's Indian subjects resident in certain parts of the Empire outside of India has been a cause of keen distress and great heart searching to the people of this country. Though Indians have been recognised by Royal Decree as equal subjects of the Crown, and India has been described by British statesmen as "the brightest jewel in the British Crown," and as "the keystone of the arch" of the British Empire; yet the Colonies have regarded India, her people, and her culture with studied contempt, and Indians resident therein, have been denied elementary civil rights, access to some of these Colonies from India has been almost entirely prohibited, and racial antipathy has been allowed to increase to a degree incompatible with harmonious Imperial relations. Above and beyond this, certain Foreign States, realising the low esteem in which Indians are held by their fellow-subject of the Crown resident in these Colonies, have not hesitated to take advantage of the apparent inability of His Majesty's Government to procure redress of the aforementioned grievances, by imposing or threatening to impose similar hardships upon His Majesty's Indian subjects resident in their respective Colonial territories.

The history of recent years shows beyond dispute that these Indian emigrants, of whom India is justly proud, have almost everywhere lost ground, that constant attempts are being made, in the aforesaid Colonies, to reduce their status to one of recognised inferiority, and that the spirit of racialism has been mostly rashly fomented, whilst the poison of racial prejudice is spreading swiftly to other parts of the Empire which until quite recently, have been almost entirely, if not entirely, free from it. The existence of this grave danger to the Empire, and the desire to strengthen the hands of His Majesty's Government in coping with it, have impelled the citizens of Bombay respectfully to place the following facts, together with their observations thereon, before Your Excellency in Council.

SOUTH AFRICA

South Africa has long been the worst offender against Indian national sentiment, and it is

there that the prestige and honour of India have been most at stake. Ever since 1885, when the late South African Republic induced the then British Government to accept a law directed against "the native races of Asia, including the so-called coolies, Arabs, Malays, and Mahomedan subjects of the Turkish Dominion," and which deprived them of fundamental rights of citizenship, on alleged grounds of insanitation, regardless of personal status or qualification, insult upon insult has been heaped upon Indians resident in various parts of the country. Attempt following attempt has been made to treat the Indian emigrant, carrying with him the priceless heritage of centuries of culture, as though he were entirely uncivilised. We even find Indians denied by Statute the rights enjoyed by the aboriginal natives.

In February last, a second Bill to regulate immigration into the Union was brought before the South African Parliament, in a form somewhat different from that of the earlier measure, but retaining its main features. This Bill, however, as drafted, was also found not to satisfy the terms of the Union Government's undertaking, both as regards the passive resisters and the Indians resident in the Coast Provinces. Certain amendments were promised by the Union Government, without, however, entirely removing the objection that the Bill took away certain existing statutory rights of both Transvaal and Coast Province Indians. It appears, moreover, that the opposition of the Orange Free State members has not been entirely overcome; but, more important still, a strong movement has been set on foot, mainly by the Cape and Natal members in opposition to the adoption of a prohibitory education test based upon the model of the Australian test that may conceivably operate against immigrants of European race in substitution of the far less exigent tests sanctioned by the existing Cape and Natal statutes. Whilst the citizens of Bombay deplore the fact that Parliament has been protracted without giving even so mild a measure of relief as this second Bill was designed to afford, they understand that the temporary settlement will be prolonged until the next Session of the Union Parliament, when a further attempt to pass the Bill will be made.

The published reports of the speech delivered in the Union House of Assembly, on the 31st May last, by General Smuts, in moving the second reading of the aforementioned Immigration Bill, show that the real object of the adoption of the

do not come to the country by continuous journey from their country of origin. The restriction has completely stopped the immigration of Indians into Western Canada, as there are no direct means of communication from India, transshipment at Hongkong being necessary. Even Indian students, with previous residence, have been rejected for this reason.

Only recently, the wives of two Indian residents of long standing, arriving to join their husbands, were the victims of orders of deportation, which were subsequently withdrawn as an act of grace and not because of any change of policy on the part of the Dominion's immigration authorities.

BRITISH EAST AFRICA.

Perhaps in some respects the problem that presents itself in the Crown Colony of British East Africa is the gravest of all that have so far arisen, for it seems to presuppose an inherent incapacity, on the part of the white colonists, to render even elementary justice to their Indian fellow-subjects. British East Africa has been colonised and developed by Indians for more than 300 years. The Indian population numbers 25,000, as against 2,000 white settlers, large numbers of the latter having come from South Africa and brought with them the violent racial prejudice that holds such powerful sway there.

FOREIGN COUNTRIES.

As stated in a previous paragraph thereof, Foreign States have not been slow to perceive in what low esteem His Majesty's Indian subjects are held by their fellow-subjects of European race in the Colonies, or to take advantage of the difficulties that surround His Majesty's Government in endeavouring to remedy the acknowledged evils, for they have either adopted or threatened to adopt in their own territories, against British Indians resident therein, a racial policy similar to that in force against Indians in the British Colonies; nor is it easy to see with what force His Majesty's Government can now intervene to prevent, in foreign territory, what they have not succeeded in preventing on British soil. The Canadian precedent, it is stated, is shortly to be followed by the United States of America, which, however, will be unable to legislate against Asiatics of non-British origin and enjoying the advantages of national Government. The Portuguese Province of Mozambique has long been subject to the influence of the British South African Governments, and has, upon pressure from the Transvaal, uniformly assisted in the administration of anti-Asiatic laws

in vogue in that Province, by deporting British Indians, without trial, to India, and preventing other Indians, lawfully resident in the Transvaal, from returning to their place of domicile. It is to be remarked, moreover, that Portugal differentiates in favour of Indians of Portuguese nationality an example which, it is respectfully submitted, may reasonably be pressed upon the notice of British Colonial Administrations, which if they differentiate at all, do so in favour of Asiatics of non-British nationality. In the Reichstag, recently, legislation of a restrictive nature based upon the South African model, which, it was emphasised, had been accepted by His Majesty's Government, has been foreshadowed in German East Africa, which has evidently been quick to learn the lesson of the neighbouring British Protectorate.

INDENTURED LABOUR IN THE COLONIES.

Whilst recognising with the utmost appreciation the sympathetic action of the Government of India in prohibiting the further recruitments in India of indentured labour for Natal, it was with the utmost regret that the citizens of Bombay learnt that, in spite of the fact that it was supported by every non-official Indian member of the Imperial Legislative Council, representing all communities and every shade of thought in the country, the Government of India declared their inability to accept the Resolution of the Hon'ble Mr. Gokhale, last March, to terminate entirely the system of indentured recruitment for British Colonies at an early date. They thoroughly endorse the strictures passed upon the system of indenture and re-indenture on that occasion, and regret that so much stress was laid by the Hon'ble the Member for Commerce and Industry, upon the obligation of India towards the Colonies that enjoy the privilege of securing cheap supplies of labour from this country. The citizens of Bombay feel that India is under no obligation whatever to grant labour facilities to these Colonies, and that, beyond this, the standard of treatment likely to be accorded to the Indian emigrant will naturally tend to be that given to coolies who are deprived of civil rights and are liable, for ordinary breach of contract, to criminal punishment. The conscience of India protests against the maintenance of a system that demoralises its victims, that embodies an economic and social injury both to India and to the countries that avail themselves of this semi-servile labour, and that lowers Indian prestige in the eyes of the civilised world.

CONCLUSION.

ANXIOUS as he is to emphasise the main principles underlying the claim of British Indians for civilised treatment in the British Colonies, your Memorialist has refrained from troubling Your Excellency in Council with a statement of grievances of a minor character on the present occasion. The cumulative effect of the several disabilities narrated above is, it is hardly necessary for your Memorialist to urge, far from being conducive to the existence of that harmonious feeling among the component parts of the Empire, which, he is sure, it is the interest of His Majesty's Government to foster. The effect in India as the real state of things becomes known, is necessarily of a character which the Government as the custodian of Indian interests and as the organ of Indian sentiment in the councils of the Empire cannot view without grave concern. Your Memorialist would respectfully urge that it is hardly to be expected that the people of this country will acquiesce in the treatment of Indians as an inferior race in order that the rights of self government accorded to the Colonies may remain intact. Such rights, your Memorialist would take leave to point out, are always to be understood to be subject to the paramount interests of the Empire as a whole, which are seriously and visibly affected when one portion of it inflicts injury upon another part.

For the reasons and on the grounds set forth above, your Memorialist, in his aforesaid capacity, respectfully requests Your Excellency in Council to take such steps as may be calculated, at an early date, to relieve British Indians in the Colonies of the hardships and humiliations consequent on the policy at present pursued therein. For which act of justice, your Memorialist, as in duty bound, shall ever pray, etc

AN INDIAN PATRIOT IN SOUTH AFRICA.

M. K. GANDHI, by the Rev J. Duke with an introduction by Lord Ampthill Rs 2 3

This book gives a short biography and character sketch of the leader of the Indian Community in the Transvaal.

M. K. GANDHI and the South African Indian Problem by Dr P. J. Mehta, Barr-at-Law Price Rs 4.

M. K. GANDHI A GREAT INDIAN.—This Sketch describes the early days of Mr. M. K. Gandhi's life, his mission and work in South Africa (With a portrait of Mr. Gandhi, Price Annas four)

THE INDIANS OF SOUTH AFRICA.—Helots within the Empire! How they are treated, by H. B. L. Tolak. This book is the first extended and authoritative description of the Indian Colonists of South Africa, the treatment accorded to them by their European fellow-colonists, and their many grievances. UTTERANCES OF THE DAY.

MR. GOKHALE ON SIR WILLIAM WEDDERBURN.

LADY Schwann's 'At Home,' on July 4 at 4, Prince's Gardens, brought together over a hundred ladies and gentlemen interested in India. The Hon. Mr. Gokhale, on behalf of a number of Bombay friends, presented to Lady Wedderburn a beautiful necklace of Indian work, set in diamonds and pearls, with a pendant of enamelled lotus leaves surrounded by precious stones. It doing so Mr Gokhale said:—

THE ORIGIN OF THE PRESENTATION.

Sir William's official life had been spent in the Bombay Presidency, and, though his work after retirement was for all India, Bombay naturally took a special pride in it. When, therefore, it was definitely settled that he was coming out to India to preside over the Allahabad Congress, a committee of many prominent citizens was formed in Bombay to take steps to express our admiration and affection for him in a suitable manner; and the committee resolved that the expression should take the form of a farewell entertainment to be given in Bombay on the eve of Sir William's departure from India. Unfortunately, the strain of incessant work, which it was found impossible to avoid, told on Sir William's health, and on his going to Calcutta from Allahabad it was thought best that he should sail back to Europe from Calcutta direct, instead of returning to Bombay. The committee in Bombay, who had collected a sum of four thousand rupees for the entertainment, were naturally very much disappointed at this decision, but they had to acquiesce in it as there was no help. They then decided to devote the money to sending to Lady Wedderburn a souvenir of Sir William's matchless services to India, of his last visit undertaken at such risk, and of the anxious time through which Lady Wedderburn had to go on our account, as was clear not only from her letters, but from what we learnt from the nurse. When Sir William came to know of this intention of the committee he wrote to Mr. Wacha, one of the secretaries, begging him not to spend more than a very small amount on the souvenir, and urging that the bulk of the money should be made over to the fund which had been started in Bombay

for the promotion of village sanitation as a memorial to Miss Florence Nightingale. The committee, while unwilling to be diverted from its purpose, could not disregard Sir William's wishes entirely. And so it was finally resolved to contribute one thousand rupees out of the money to the Miss Nightingale Fund and devote the rest of the amount to the souvenir which is a necklace of Indian design and Indian workmanship—the work having been executed at Bangalore—with the Indian lotus-flower in the centre. As I was coming this summer to England the committee very kindly desired me to act on its behalf and make the presentation. This is what the secretaries wrote to me before I left India:—Dear Mr. Gokhale,—As you are proceeding to Europe, and will be in London for some time, we have the pleasure to request you to be so good as to kindly agree to present to Lady Wedderburn, on behalf of the members of the Sir William Wedderburn Bombay Reception Committee, December, 1910, the necklace of brilliants which the committee unanimously voted be presented to her as a souvenir of Sir William's last visit to Bombay and as a sincere token of the very high esteem, admiration and affection in which Sir William is universally held in this city and Presidency, and of the gratitude we all feel for the great and invaluable services he has rendered to India during a lifetime devoted entirely to her service.' In accordance with this wish of the committee it is my privilege now to present this necklace to Lady Wedderburn. Long may she and Sir William be spared—objects of affection, gratitude, and reverence to the countless millions of India!

THE YEAR 1910 IN INDIA.

Ladies and gentlemen, I stated at the outset of my remarks, that for certain special reasons, Congress leaders in India were anxious, in 1910, to get Sir William Wedderburn to preside over that year's Congress, and I think I should explain briefly what those reasons were. The year 1910 marked the definite closing of one chapter and the opening of another and a brighter one in the history of India. The far-reaching scheme of reforms announced at the end of 1908 was brought into operation during 1909, and the first elections to the new Councils took place at the beginning of 1910. It was an important juncture, and the foremost need of the situation was that all classes of the community—officials and non-officials, Hindus and Mahome-

dans, and different sections of the Progressive Party—should join in a common effort to make the new order of things a success. Old misunderstandings had to be put aside, old quarrels healed before the country could enter successfully on the new era which undoubtedly was in sight. For some time before the introduction of the reforms a steady alienation of feeling had gone on between the officials and the people in India—an alienation which culminated in the bitterness that characterised the opening years of the new century. The Hindus and Mahomedans, too, who had long lived amicably side by side in the country, had come to be divided widely by a sharp and somewhat sudden antagonism as regards the share which the Mahomedan community was to have in the new privileges. And, owing to the occurrences at the Surat Congress in 1907, a serious split had taken place in the ranks of Congressmen in the country, bringing in its train those disastrous consequences which discussion never fails to produce. All these differences were bound to hamper the working of the reform scheme, and no task was therefore more vitally necessary in 1910 than that of earnestly addressing a plea of conciliation all round to the different interests or sections concerned. And Congress leaders felt that, from their side, no one could urge such a plea with more authority or with greater effect than Sir William Wedderburn. It was, therefore, as a great conciliator that Sir William was invited that year to go out to India. And the address which he delivered from the chair of the Congress showed how fully he realised the requirements of the situation and how wholeheartedly he entered on this mission of conciliation. The keynote of the address was triple conciliation—conciliation between the officials and the people, between Hindus and Mahomedans, and between Congressmen and those who had seceded from the Congress. With the authority of an old official and of a devoted friend of Indian aspirations, he appealed to officials and non-officials to put aside, as far as possible, their old differences and enter on their new duties under the reform scheme in a spirit of mutual appreciation and co-operation. As one who had laboured for India as a whole, and never made any distinction between Hindus and Mahomedans, he appealed to the members of both communities to think of their vast common interests and unite in the sacred service of their common motherland. But, as the recognised head of the Congress organisation for a quarter of a century in

England, he appealed to the seceders to return to the fold, appealing to Congressmen at the same time to make it as easy as possible for them to return, consistently with the fundamental position of the Congress. And in every quarter his words evoked a cordial and sympathetic response. Wherever he went the officials took occasion to mark the esteem in which they held him, and even His Excellency the Viceroy gave expression to his satisfaction at the work which Sir William had done. The Anglo-Indian Press was full of generous appreciation. His Highness the Aga Khan, with about fifty prominent members of the Muslim League, went specially from Nagpur, where the League was then holding its sittings, to Allahabad, where the Congress was in session, to attend a special conference, under Sir William's chairmanship, to consider Hindu Mahomedan relations. And those who had seceded from the Congress approached him with letters and telegrams from all parts of India with suggestions as to how a reunion could be brought about between different sections of the Progressive Party, and made it abundantly clear that, whatever their differences with Congressmen in India, for Sir William Wedderburn they had but one feeling—that of intense affection, reverence, and gratitude. It was thus, first, to act as a conciliator all round, at a special juncture in our affairs, that we were anxious to have Sir William in India in 1910. But we were also anxious to have him for another reason. The reforms of 1908, which, as I have already said, opened a new chapter in our history, though they will specially remain associated with the names of two English statesmen—Lord Morley and Lord Minto—were really rendered possible by the long spade work, extending over a quarter of a century done by the Congress both in India and in England. And the work in England which in some respects was even more important than the work in India, was, in reality, the work of two high souled and devoted Englishmen—Mr. Hume, now, alas! lying in a critical state of health, and Sir William Wedderburn. Other friends of India had, no doubt, contributed to this work from time to time in a lesser degree, but the brunt of it was borne by these two; and it was the barest truth to say that, but for Sir William's single-minded devotion, his dogged perseverance, his singular tact, and his infinite patience, it could not have been kept going for so many years, neither could it have been so fruitful.

SIR WILLIAM'S WORK FOR INDIA.

After a quarter of a century's official connexion with India, Sir William took up this voluntary work for us, and it is interesting to note that he has now completed another quarter of a century in India's service. Those who know him well need not be told that only a supreme sense of what was necessary in the interests of both England and India impelled him to undertake this work. His nature is a typical English country gentleman. He lives a quiet life; he is devoted to gardening, and he is fond of travel. And he might well have indulged these tastes after his retirement from the Indian Civil Service, and might have, in addition, enjoyed the dignity of a seat in Parliament—he was for some years in the House, and he might have continued indefinitely—in comparative ease. But he felt that India needed him, and he decided to place his time, his energies, and his resources unreservedly at her disposal. Ladies and gentlemen, there have been great Englishmen in the past in this country who from time to time have raised their powerful voice on behalf of India. From Edmund Burke to Charles Bradlaugh a succession of great men have championed the cause of India in Parliament. And India will always cherish their names with gratitude and admiration. But India to them was not their sole or even their main interest in life. It was their strong sense of justice that led them from time to time to enter a passionate plea for justice to India. In Sir William's case, however, India has been his sole and single interest. And the way in which he has laboured for her now for twenty-five years has really no parallel in Anglo-Indian history. It is, I think, comparatively easy to work for India in this country now, but it was not always so. As a prominent Englishman said to me the other day, it is not difficult to work for a cause with public enthusiasm on your side. It is not even difficult to work for it against opposition. But the most difficult thing is to work for it amidst apathy, ignorance, and ridicule, and most of Sir William's work had to be done under such conditions. An Englishman, who will soon be going out to India in a high capacity, told me only yesterday how his heart went to go out to Sir William when, sitting by his side in the House, he watched his sensitive spirit—and Sir William, by nature, is very sensitive—suffer under constant rebuffs encountered in the service of India. Was it any wonder,

then, that when the new order was inaugurated, and a brighter day had arrived, we in India should be anxious that one who had laboured for us so strenuously and borne for us so much should come out to witness with his eyes the fruit of his patient and devoted labours? It is true that the Reform scheme does not carry us far—that we are still a long way from the enjoyment of any real self-government. But it constitutes a valuable step in advance. Its most important feature is the power conferred on members of Legislative Councils to raise debates on administrative matters. By a wise and persistent use of this power we shall be able gradually to substitute an administration conducted in the light of public criticism responsibly tendered by public men face to face with officials for an administration conducted by officials with good intentions, no doubt, but conducted in the dark and behind the backs of people. *And this, to my mind, is a great step in advance.* In think a machinery has now been created in India whereby all our minor grievances can be brought effectively to the notice of the Government without troubling Parliament or the people of this country. For large questions of policy or principle our appeal will have still to be here; but the labours of Sir William Wedderburn and those associated with him have resulted in placing in our hands an instrument of progress which will meet all our minor requirements, and will further enable us to exercise no small influence in moulding our own future. We, therefore, rejoiced when Sir William definitely accepted our invitation. We rejoiced when he arrived in India, and we rejoiced even more when he was able to leave the country after completing his labour of love, undertaken at his great age and in his unsatisfactory state of health, without a serious breakdown. And now, ladies and gentlemen, nothing remains for me but to tender once again our heartiest thanks to Sir Charles and Lady Schwann for the great trouble which they have so readily taken in arranging this function and to you all for your kind presence here this afternoon.

GOKHALE'S SPEECHES.—An exhaustive and comprehensive collection of his speeches, with a biographical sketch and a portrait. Over 1,100 pages. Crown 8vo. Price Rs. 3 To Subscribers of the *Review*, Rs. 2-8.

G. A. Natesan & Co., Sankurama Chetty Street, Madras.

INDIANS OUTSIDE INDIA.

The South African Question.

In the House of Lords on July 17th Lord Amthill said that the question of Indians in South Africa was again causing anxiety in the first place because the long-promised settlement had again been postponed, and secondly because the management of the settlement was now in the hands of Mr Fischer who was less amicable to Indians than General Smuts. Meanwhile the spirit of the settlement was being violated. His lordship gave instances in this connection.

Lord Emmott replied that the Government had always considered every case and were ready to intervene if any useful purpose could be served thereby; but they were not going to be driven into policy of constant 'nagging'. There was reason in some of Lord Amthill's complaints, but, said Lord Emmott, if he wanted all those individual cases affecting the self-governing colony to be made the subject of representation, then he must wait till the Unionists were in Power.

Lord Amthill (interrupting): 'I only suggested representations of a general tendency with regard to the treatment of Indians.'

Lord Emmott: 'It is impossible to deal with a number of cases on general terms. We must deal with each on its merits.'

His Majesty's Government considered the Immigration Bill generally satisfactory and keenly regretted that it had not been passed this session, but they had positive proofs of the South African Ministers' anxiety to pass it. The Ministers had expressed regret to Lord Gladstone and promised to introduce it at the earliest moment next session.

With regard to the change of portfolios between Mr. Fischer and General Smuts, Lord Emmott said they were members of the same Government and presumably their policy in the matter was the same. His Majesty's Government had for a long time been trying to obtain appeal on the question of domicile. Ministers had promised an amendment to the Immigration Bill giving appeal. Such amendment, said Lord Emmott, would have been most valuable. The case quoted by Lord Amthill did not afford ground for the general charge of departure from the spirit of the settlement.

FEUDATORY INDIA.

Railway Extension in Dholpur.

Sanction has been accorded to the construction, by the Dholpur Durbār, of a line of railway on the 2 ft. 6 in. gauge from Bari, the present terminus of the Dholpur Bari Railway, to Tantpur, a distance of 16.4 miles. The line will be known as the Bari-Tantpur Extension of the Dholpur Bari Railway. Sanction has also been accorded to a Survey being carried out by the South Indian Railway Company for a line of railway on Adam's Reef connecting the present terminus of the South Indian Railway in India with the Ceylon Railways at Manaar. The survey will be known as the Dhanushkodi-Talai Manaar Railway Survey. A detailed survey is to be carried out by the Agency of the Bombay, Baroda and Central India Railway Company for a line of railway on the broad gauge line from Vasad station on the Bombay, Baroda and Central India Railway to Katana, *viâ* Borsad, a distance of about 27 miles. This survey will be known as the Vasad-Katana Railway Survey.

An Agricultural School.

The opening of an agricultural school in Bangalore has been sanctioned according to the scheme of Dr. Coleman, Director of Agriculture in Mysore. It is intended primarily to train sons of landlords to work their own land and not to qualify for State service. The course will be spread over two years and will include veterinary science.

Railway Construction Department.

The Mysore Government have formed a Railway Construction Department, with Mr. E. A. S. Bell in charge as Engineer-in-Chief, who is in the first instance to devote his attention to the revision of projects for Bowringpet, Kolar and Arsikere-Hassan-Mysore lines with a view to construction at an early date. He will also submit a construction programme for the next five years.

The New Minister of Hyderabad.

In a special Firman issued on the 11th July 1912, Nawab Salar Jung Bahadur was appointed, by H. H. the Nizam, Prime Minister of Hyderabad. In the brilliant function that followed at H. H. the Nizam's Palace the Resident congratulated His Highness on his wise choice of the young minister and also the Minister himself on the honour conferred on him, and concluded his remarks with the gracious compliment and hope that young Nawab Salar Jung Bahadur would emulate the grand work of his grand-father the famous Minister Sir Salar Jung I, who so helped to give stability to his Government at a critical period. This action may not be praising the new younger minister too highly, as, although he is not quite twenty-six years of age, it is an accepted fact that he has taken a far deeper interest in affairs of H. H. Nizam's Government, probably with a view to its future control, than he has been given credit for: these facts were however, known to H. H. the Nizam and as the Resident says the choice of minister is wise and popular, and both are great elements to encourage success. Nawab Salar Jung was educated at the Nizam's College, and under private tutorage: his tuition throughout has been sound and those who had the pleasure to discuss general topics with him have been keenly impressed with his intellectual qualities and learning. As a guide, philosopher and friend he will be closely associated with the learned Syed Ali Bilgrami who will counsel him in his probation. Among those who know him best, it is their prophecy that Nawab Salar Jung Bahadur has a great future before him. Some partisans may think youth is the only drawback to his selection, but it must not be forgotten some of the greatest statesmen the world has known have commenced their careers equally young and developed that success which has become unimpeachable history.

Maharaja Hira Singh Endowment.

His Highness the Maharaja of Nabha lately granted a sum of Rs 1,50,000 for a public memorial to his revered father, the late Maharaja Bahadur. This amount has been decided to be utilised for an educational endowment. It will be invested in the State Bank and from the interest scholarships will be awarded to His Highness's subjects proceeding to foreign countries for purposes of education. In order to be self-contained the State should train its own subjects for positions of trust and responsibility. It is therefore right that His Highness should prefer to encourage his own subjects to benefit from this endowment. With the proceeds of the fund the State can continually maintain one student in England, Germany or America, and once in two or three years it will be able to get back one such well educated man for employment in the State Service. In awarding scholarships the State should obtain an agreement from candidates binding them to serve Nabha for a definite period. There are instances in Kashmir and elsewhere in which students educated at the expense of one State have accepted service in another State or under Municipalities in British India. We congratulate the present Maharaja on his wise and thoughtful decision to encourage higher education.—*Punjabee*.

The Gift of Nepal

His Highness Maharaja Sir Chandra Shum Shere Jung Bahadur Rana, G.C.B., Prime Minister of Nepal, who in 1909 presented a very valuable collection of 6,300 Sanskrit MSS. to the Bodleian Library, has just placed the University of Oxford under a new obligation by sending on loan from his private library at Katmandu 70 carefully selected Sanskrit MSS. which have been personally handed over to the Boden Professor of Sanskrit at Oxford by a representative of Messrs. Keymer Son and Co., of 1, Whitefriars Street, London.

INDUSTRIAL AND COMMERCIAL SECTION.

Indian Barley and England.

It was stated in "the Punjab Agricultural Notes" that a demand has arisen in Europe for Indian barley. The exports of this article during 1911-12, amounted to 221,036 tons as against 11,112, tons in 1910-11. It was added at the same time that English maltsters complained that the grain exported was very unequal in quality, some consignments being excellent whilst others contained so much dead grain and foreign substances as to be almost useless. The Director of Agriculture in the Punjab has done well to call the attention of the exporters to this matter. There is, no doubt, that some attempt at adulterating barley with dead grain and foreign substances was made. It should be stopped, for otherwise it will give India a bad name and English maltsters will hesitate to buy the barley sent from this country. It is difficult to say whether the present demand for Punjab barley in the English market was a temporary affair or whether it will last. In the meantime it is announced that steps will be taken by the Department of Agriculture in the Punjab to test and compare the different types of Punjab barleys as to their malting and agricultural qualities. If the demand continues to increase it might give a fillip to the cultivation of barley on a large scale in this Province.—*The Tribune*.

Cotton Excise Duties

Intimation has been received that the resolution for the abolition of the cotton excise duties, submitted by the Upper India Chamber of Cawnpore at the Congress of Chambers of Commerce which is being held in London, has been rejected. The representatives of the Bombay Chamber of Commerce who, it is alleged, represented importers' interests, were opposed to the resolution.

Synthetic Rubber.

All who are interested in Indian or Malay rubber plantations must be disquieted by the reports, which are so frequent just now in the Home Press, of the possibilities of the manufacture of synthetic rubber. There can be no doubt that synthetic rubber has been produced both in England and Germany and the question which remains to be settled is whether the process can be adopted to commercial purposes. On this point very little has so far been disclosed. On the general question one of the most recent contributions is furnished in the paper, which was recently given before the Society of German Chemists by Dr. Hofmann, who has charge of the researches now being conducted by the Bayer Company at Elberfeld. A few years ago most leading chemists considered that the synthesis of rubber from isoprene was quite out of the question, and it was left to the large chemical undertakings with their vast resources to prove the contrary. At the present day the Elberfeld Farbenfabriken, the Badische Anilin- und Sodafabrik, and A. G. Vorm. Schering, Berlin, and several firms out of Germany, are all engaged on the problem of the commercial production of synthetic rubber from isoprene. Dr. Hofmann stated that he himself was led to commence experiments on the subject by reading an account of an English lecture dealing with this matter over five years ago. After a considerable amount of work he succeeded in preparing isoprene from cresol, and in 1909 he produced the first sample of actual synthetic rubber. The whole question is no longer vague and shadowy, but how soon the manufacture of rubber will be a commercial proposition it is impossible to say. As the annual value of the raw rubber output is over £50,000,000, the importance of the problem is enormous.—*Indian Industries and Power.*

Saving in Little Ways.

One of the great railways has issued rules for saving on little things that are worth printing; Watch the ink well to see that it is covered when not in use. It does not take long for the ink to thicken and and evaporate. Do not throw the ink away when it becomes thickened, but add a little water, and you will be surprised to see how long a bottle of it will last. Do not use your typewriter ribbons on one side until they are worn through, but when the impressions become faint use them on the reverse side. You will be surprised at the nice, clear work thus obtained. A saving of at least 30 per cent. will result. Do not keep your copying cloths constantly in water, as they rot quickly. When saturated with ink soak them over night in a weak solution of chloride of lime and water. Rinse them several times in clear water to remove the lime from them. Keep the top of your pad free from lint. It will soon cake, thus lessening the usefulness and life of pad.—*Science Siftings.*

Labour in the Central Provinces.

The evidence furnished during the past few years of the improvement of the condition of the industrial classes in India is of a very remarkable character. In the Resolution on the Reports of the working of the Factories Act in the Central Provinces during last year it is stated that wages continued to be high everywhere, and that complaints are general of the difficulty of recruiting new labour at reasonable rates. One manager reports that the slightest interference with his operatives leads to a crop of desertions. There is no doubt," the Resolution adds, "that labour, both skilled and unskilled, has never been in a stronger or more prosperous position in these Provinces." It is regrettable to find that the punishments awarded by magistrates for breaches of the existing Factories Act are still inadequate, but the hope is expressed that an improvement will take place under the new law.—*The Statesman.*

Wax from the Sugar-Cane.

The following summary of much that is known about the subject is taken from the *Modern Sugar Planter* for April 27, 1912:—

Wax is an important constituent of the filter press cake, being present to an extent up to 12 per cent. of the dry cake. This wax can easily be extracted by boiling the dried cake with organic solvents, like alcohol, carbon tetrachloride, etc., and the extract thus obtained is filtered off and cooled when the wax solidifies out as a yellowish white mass.

Very considerable attention has been given to the possibility of extracting this wax. Among recent work may be mentioned that of Wynberg, in Java, who determined carefully the properties of the wax, and perfected a method of extracting it from press-cake. The wax was said to have similar properties to the expensive carnauba wax, and therefore to be worth probably 20 to 25c. per lb.

After this the question was taken up by the Hawaiian planters two or three years ago, and with characteristic progressiveness they submitted large samples of the wax to Lewkowitsch, the eminent London specialists on waxes, fats, etc., whom they engaged at considerable expense to examine the wax and pronounce upon its commercial value. Lewkowitsch's investigation was duly made and his report communicated to the Hawaiian Planters' Association. Animated by the secretiveness which during the last few years has characterized this Association (the replacing of the *Hawaiian Planters' Monthly* by a similar journal for private circulation among the members) the results of this work were not published to the outer world. From a private source, however, the writer learned that Lewkowitsch's report had been to the effect that the wax consisted of a mixture of several chemically different waxes, and that the substance had only a small commercial value of from 4 to 5c. per lb.

Unwoven Mosquito Net.

A French Company for the application of cellulose is manufacturing at Fresnoy le Grand (Aisne) tulle at the rate of 25,000 metres per day continuously—enough to supply France and her colonies. The process consists in the preparation of a stiff paste of cellulose which is moulded into the desired form and solidified, after which it is washed, dyed (if necessary), dried and finished. The company prepares a curpro ammonium solution of cellulose made from cotton waste. It is passed between metallic rollers, one of which is engraved with the design it is desired to reproduce. The pattern on the roller filled with paste, which is pressed into patterns by another roller and is carried down into a suitable bath, where it is solidified. It next passes to a hot air chamber after which it is ready for the processes of finishing. No data are available regarding the strength of this fabric as compared with cotton and its capacity to resist the attentions of the Indian dhobi. Incandescent mantles made by this process are expected soon to be on the market and they are claimed to be stronger and cheaper than those made from artificial silk or ramie fibre. This may very well be, for each piece will be free from any loose parts. If the new tulle has anything like the wearing properties of the ordinary net and can compete with it in price per pound, there seems to be a very wide field open to this new process. —*Indian Textile Journal*.

Trade with Japan.

It is understood that the Department of Agriculture and Commerce in Japan will despatch an expert this month to India to inquire into the business conditions here, special regard being given to the export hither of *habutae*, cotton knitted goods, shirts, matches, silk fabrics, and porcelain. Where there exists any competition with foreign countries, all available means will be considered to push Japanese goods ahead.

Industries in Bombay.

His Excellency the Governor-in-Council has had under consideration the question of instituting an industrial survey of the Bombay Presidency and had examined measures recently initiated in other provinces in India for studying the industrial possibilities in these areas. In some places a special officer has been entrusted with the work. A survey of the indigenous industries of the province by the special appointment of a Director of Industries and technical enquiries have been made. The object is to ascertain the obstacles with which various local industries contend and devise measures of such other means as may in each case seem most likely to secure the object in view. Some information bearing on the present state of the handicrafts in the Bombay Presidency is to be found in some special monographs, but the information is far from complete. The Governor is of opinion that the survey must be the work of experts employed in succession to examine and report on the position and requirements of each industry of importance. The survey of hand loom industries was carried out in 1908 and 1910, respectively. The next survey will be of oil-pressing. Mr. Yashwant Ganesh Pandit who has acquired considerable experience in this industry in the United States of America and in India has been selected for the purpose commencing six months' engagement from 1st October.

Opium and Alcohol.

Mr. Charles Robert, in moving his resolution, dealing with opium and alcoholic liquors, in the House of Commons said he hoped that the Government of India's connection with the sale of opium for other than medical purposes would be terminated as soon as possible, and that the inhabitants of India would be given greater power in determining the location and number of liquor shops.

AGRICULTURAL SECTION.

Appearance in Seeds.

There are various qualities which go to make up excellence in seeds, more especially in seed corn. Weight, shape and appearance—not necessarily colour—are the main points to attend to, and they are frequently neglected. To this must of course, be added germinating power, which is a natural corollary to good looks.

It is true that ill shaped corn of poor appearance may both germinate well and give fair results, but its use is inadvisable. The progeny of such lean seed corn will not be so satisfactory to the miller or to the consumer as sounder grain, and as like begets like, it is only natural to suppose that a bright, sound, handsome sample of seed will give better paying results than a stock inferior in appearance in these respects.

However, as in the animal kingdom, there are exceptions to this rule, as I have found myself by experiment. On the point of germination, for example, I selected seed notable for its leanness and bad shape, but it germinated well, and I have even obtained 100 per cent germination from light seeds that refused to sink in water. This is a sign of bad quality as a rule, but the stock was apparently vigorous. It does not necessarily follow, however, that the vigour would be maintained.

Even if a good percentage of germination were obtained the chances are that it would be irregular, and this is apt to be troublesome, if nothing worse. Weak or isolated plants are more open to attack from pests of various kinds, weeds especially.

Other things being equal, then seed of good weight is more likely to germinate well than is light seed, and this is true to a very marked extent with grass.—GÉRAISSE TURNBULL in the *Agricultural Economist*

Agricultural Education its value and Importance.

Mr. Hiralal H. Pandya writes to us :—

It is an open fact that India is an Agricultural country. About 80 p. c., of its Population is engaged in this line; but the grievances coming from all directions are that India has failed in many quarters to produce rich commodities as it did before quarter of a century. The very first reason to this seems the lack of proper Education. People have hardly tried to look into the real matter or cared to know the importance or value of such Education or the places where such Training is imparted.

Thanks to the Government that it has taken up this matter at an early date and established Agricultural Departments in different centres of India. Agricultural Education can now be obtained at a number of Institutions namely—Poona, Nagpur, Coimbatore, Cawnpore, Bhagalpore, and Lyallpur in Punjab. The chief aim and object of these Institutions are to impart special and practical instruction in Sciences connected with Agriculture by means of Lectures, Experiments and Practical Laboratory work and thorough acquaintance is thus gained with the Scientific truths upon which all good systems of Agriculture are based. In order to combine study with practical experience students receive instruction in practical Farm Work under proper direction. The full course extends over a period of three years. The Scientific course includes Agriculture, Chemistry, Physics, Agricultural Chemistry, Geology, Botany, Survey and Leveling, Engineering, Entomology, Veterinary, Mycology, etc. The advantages of such a course of Study are the combination of Theory with Practice. The student sees for himself various rotations of crop, different modes of cultivation and becomes acquainted with the manures, seeds selection, feeding stuffs and the different breeds of cattle. Thus in fact a student is prepared to

work out his own line independent of all allied subjects. The students of the advanced classes become acquainted with the prices of the stock, implements, produce, cost of building, and thus become quite fit to transact the business of the farm. Not only such an Education would prepare a student for Farming but other business as well.

A man with these qualifications can proceed to United States of America, England or Japan (preferably the first) and get a finishing touch in the course of a year or two. America is nowadays specially renowned for its scientific value in Agriculture and the more advantage it affords is that the soil and climatic conditions of that country are more or less just the same as in India.

Students if trained practically in general Agriculture or for one of the specialized courses of Dairy, Cattle Breeding, Cotton & Sugar Cultivation, Dry Farming, Fruit culture and packing can do very well both to themselves and their Mother Country after their return from that land to India.

Warm Water for Indoor plants.

A French authority has discovered that cuttings of certain plants can be made to bloom in winter by placing them in a vase of water kept 40 deg. Cent. Thus, for instance, syringa can be made to bloom luxuriantly in about a fortnight's time, even if there were no buds observable when first cut. The only difficulty is to maintain the water at the proper temperature. This, however, is not unsurmountable in an apartment during the winter months from November to February. All that is necessary is to keep the plants in a room heated at a steady temperature, and to pour into the vase water a little over 40 deg. Cent. (104 deg. Fabr.) four or five times a day, particularly in the morning and towards evening.

Science Sisters.

Cotton Growing in India.

Mr. Arne Schmidt, the Secretary of the International Federation of Master Cotton Spinner's and Manufacturers' Associations, was recently deputed to India to investigate the possibilities of cotton growing in this country. Owing to Mr. Schmidt's duties in Europe his stay in India extended only to a very short period. He was, however, during this time able to visit the more important cotton growing provinces. On completion of his investigations he has compiled a report. Mr. Schmidt is, we are told, a very able man and his views on this important subject, will therefore, be read with interest and attention. He thinks that the yield per acre has already increased and is gradually increasing and that the cotton crop can be doubled without in any way interfering with the growing of food supplies. He urges that the Agricultural Department should not encourage farmers to take up the cultivation of new kinds of cotton until it is quite sure that the cultivators will get adequate return thereby. Mr. Schmidt suggests that the Government should engage an additional European duly qualified agricultural expert for every province who should specialise on cotton. Unless steps are taken to improve the cultivation of cotton, he adds, there are signs that other industries will receive the foremost attention from the Agricultural Department.

The Indian Agricultural Service.

It is understood that proposals have gone to the India Office for the recruitment at Home of an officer for the Indian Agricultural Service specially trained in agricultural bacteriology. The selected candidate will be attached to the Agricultural Research Institute at Pusa.

Tea Cultivation

The Madras Government has made a grant of 160 acres of land on the Anamalais hills in the Coimbatore district for tea cultivation to the Anglo-American Direct Tea Trading Company.

Rice-reaping Machine.

It is reported that a new rice reaping machine has given highly satisfactory results in Italy and was awarded a prize of 5,000 lire in the international competition for rice-reaping machines promoted by the Farmers' Association of Vercelli. It consists essentially of a reaping mechanism driven by a small gasoline engine and mounted on a large wooden wheel and on a hollow cast iron skid. This skid is placed as far below the centre of gravity of the machine as possible, and also is made ingeniously to serve as a reservoir for water for cooling the motor, and further, by the fact that it is partly filled with water, to add an important gravity action. The lower surface of the skid is placed two or three inches above the lower rim of the wheel. In this wise, any tendency of the wheel to sink in soft earth is checked. One of the most important functions of the skid is due to the fact that it is partly filled with water. When a hillock, hummock, or furrow is to be crossed and the forward part of the skid rises, the water runs toward the back of the skid. By the same token the water runs forward when the forward part of the skid is depressed after a hillock is passed and adds a useful downward impetus to the machine. The reaper has amply demonstrated, it is stated, its ability to reap over seven and a half acres of rice in ten hours.—*Indian Trade Journal*

Organic Nitrogen.

There are large numbers of manures which yield nitrogen in an organic form, and these are popular in spite of the fact that the results are less than from mineral nitrogen, and that the latter are generally a good deal cheaper. A great point however, with organic nitrogen is its continuous action in the soil. It feeds the plant gradually and thoroughly, just as guano does, and herein lies much of its virtue, and also probably its popularity over the two other manures—G. Linford in the *Agricultural Economist*.

Departmental Reviews and Notes.

LITERARY.

ANDREW LANG.

A most genial and wholesome influence in the world of literature and journalism has passed away in the death of Mr. Andrew Lang. No English writer of our day working upon so high a plane of merit had so abundant a literary output to his credit. In addition to his uncollected essays, articles, prefaces, reviews, notes and letters he had since his debut in 1872 produced more than sixty volumes. And the quality of his works is as remarkable as their number.

"The Merry Andrew of our Reviews" was born in 1844 at Selkirk, Scotland. Educated at the Edinburgh Academy, St. Andrew's University and Balliol College, Oxford, he quickly became an honorary Fellow of Merton College. He was well-grounded in the Ancient Classics which is best seen both in the temper of his mind and the attic grace of his diction. With the command of a pellucid and clear style, at once simple and telling, he won distinction as poet, historian, critic and journalist. His first publication was a volume of verses—every prose writer of marked originality first turns his hand upon poetry—which he soon after abandoned for the more congenial craft of the critic. Although a prolific writer, he found time to specialise certain subjects of study in which he became an acknowledged authority. He had a partiality for Homer, Scottish History and Anthropology and he was master in his field. His translations are remarkable for accuracy of scholarship and excellence of style. Mystery and Mythology were close at his heart and he revelled in them. And his controversial writings had won him deserved popularity. But perhaps his most enduring works are the volumes of fairy

tales which are a perpetual fountain of delight for the children. Whatever else men may think of him, children can never forget him.

Indeed the variety of his literary pursuits are marvellous. Every province of *Belle Letters* claimed his attention. The genial nature of the man is stamped in his works. They display a mind stored with an encyclopedic knowledge of men and things, clear perceptions and sound judgments and above all a character of singular manliness and geniality. With the temper of a somewhat old world wizard no man was more up-to-date in his cosmopolitan sympathies. Literature and journalism had never before a more ardent representative and they are the poorer for his loss.

ADVICE TO THE LITERARY ASPIRANT.

Literature has never yet produced a millionaire. But there is always the young literary aspirant who thinks it is going to. To him Robert Louis Stevenson proffers the following sensible advice—"If you adopt an art to be your trade, weed your mind at the outset of all desire of money. What you may decently expect, if you have some talent and much industry, is such an income as a clerk will earn with a tenth, or perhaps a twentieth, of your nervous output. Nor have you the right to look for more; in the wages of the life, not in the wages of the trade, lies your reward; the work is there the wages."

ORIENTAL LITERATURE.

Professor A. A. Macdonell and Dr. A. B. Keith have prepared for the Indian Records Series (issued by Murray for the Government of India) a "Vedic Index of Names and Subjects," which will be published in two volumes. All the historical material contained in Vedic literature before the rise of Buddhism, about 500 B.C., has been systematically extracted for the first time, and arranged into what is practically an encyclopaedia of the earliest Aryan antiquities of which we possess any documentary evidence.

EDUCATIONAL.

THE DEPRESSED CLASSES.

The Bombay Government have reserved one Middle School Scholarship, valued at Rs 5 a month, for a student of the Depressed Classes in each district in the Bombay Presidency for five years as an experimental measure

EDUCATION IN THE UNITED KINGDOM

According to the latest statistics available, the total cost of primary and secondary education in the United Kingdom from rates and taxes was £28,947,000 or Rs. 434,205,000. There were places in the elementary schools of England and Wales for 7,035,318 children. The special subjects taught in these schools were handicrafts to 233,420 boys in 4,283 schools, domestic subjects to 489,677 girls in 10,780 schools, and Rural subjects (gardening and dairy) to 33,254 scholars in 1877 schools.

THE LONDON UNIVERSITY

Mr. Ratan J. Tata has made an endowment to the London University, consisting of a donation of £1,400 a year for three years. The object is to institute research into the principles and methods of preventing and relieving destitution and poverty. The Senate of the London University has conveyed its thanks to Mr. Tata. The details of the scheme will be announced later.

HINDU AND MAHOMEDAN UNIVERSITIES

A Press Communication states that in view of the recent announcements it is important to state that the decision in regard to affiliation to the proposed Universities of Aligarh and Benares is the decision of the Secretary of State and that it is final. This is probably a reply to the protest of Nawab Viqarul Mulk and any protest that may be made by Hindu leaders on behalf of the Hindu University.

THE FUNCTION OF A UNIVERSITY.

Lord Haldane, in the course of an address, said that the function of a University was quite different from that of a University school, or even a secondary school. In an elementary or secondary school the teacher came forward in a position of authority. There were certain facts and principles which he delivered to the pupil too young to question them, and not expected to inquire into their scope and truth. The mind of the pupil was receptive, he was storing learning in those early stages. But when they came to the University, the professor and the student were alike in the region of the unknown, they were on a voyage of discovery in which the difference between them was that the professor was more equipped and the more thoroughly experienced on the difficult road on which both were advancing in quest of new learning. Unless the professor was a man of the highest capacity, and of a personality which stimulated and developed the imagination of the student, imbued him with the spirit of research, and connected him into a new atmosphere, the work failed.

ELEMENTARY EDUCATION IN MADRAS.

The Government of Madras have approved the proposals submitted by the Director of Public Instruction for opening 108 Elementary schools during the current year in 41 Municipalities, and sanctioned the payment of a sum of Rs. 99,262 to the Municipalities concerned to meet the cost of the new schools. The expenditure will be met from the lump provision of Rs. 4 lakhs under the Education grant in the current year's Budget. The Municipal Councils will be requested to see that the new schools are established without delay. Every endeavour should be made to avoid interference with Mission or other schools that are successfully working or are unwilling to be taken over.

LEGAL.

INDIAN CHIEF JUSTICES.

Sir Narayan Chandavarkar is the fifth Indian who has been appointed to officiate as Chief Justice of a High Court. The first was Sir Romesh Chandra Mitter, the second was Sir T. Muthuswami Iyer, the third was Sir S. Subramania Iyer, the fourth Sir Chandra Madhab Ghose, and the fifth Sir Narayan Chandavarkar.

INDIAN TREASON TRIALS.

A good deal has been said lately in our columns and elsewhere, on the unsatisfactory procedure in the State prosecutions for sedition and conspiracy in India, but so far little or no attention has been given to one particular aspect of the matter—namely the treatment of accused persons who in the end are acquitted. The remarkable Dacca case, lately concluded, furnishes an illustration. According to High Court appeal judgment, fully reported in the papers to hand by last week's mail, twenty-one out of the thirty-five prisoners were acquitted, while the convictions of the remaining fourteen were confirmed, though the sentences were in all cases reduced. The accused were all arrested in July 1910, and the twenty-one now discharged have been kept in prison, without bail, through the three protracted stages of the affair—magisterial inquiry, sessions trial, and High Court appeal.—altogether a year and nine months. Several of them are in their teens, and the majority are described as belonging to families of some standing in Eastern Bengal. In the early days of the affair the Indian press in Calcutta, foreseeing these long-drawn proceedings, involving practical ruin even to those who should be fortunate enough to escape in the end, urged that the Government, if it were resolved to prosecute, should have taken advantage of the Summary Justice Act of 1908 and had the accused committed to a Special Bench of the Calcutta High Court. This method would have been both speedy

and economical, for the trial would have ended in a few weeks. It is significant that the request for summary procedure should have come from the side of the accused notwithstanding that, as everybody recognised, the result would probably have been a heavier list of convictions and penalties. All parties in India, it is clear, welcome the finish of the Dacca case as the last scene in a costly and disturbing series of prosecutions; but, meanwhile, what of the twenty-one men and youths, who now declared to be innocent by the highest court in the land, have suffered imprisonment for nearly two years?—*The Manchester Guardian*.

PRECEDENCE AMONG JUDGES.

It will be interesting to know what is the correct rule regarding precedence between a judge of the High Court who holds a permanent seat and a judge who is merely officiating, where the incumbent of the permanent seat happens to join the court later than the officiating judge. The question is of some interest in Allahabad where Mr. Justice Rafique has succeeded Mr. Justice Karamat Hussain permanently and Mr. Justice Piggott is officiating for Sir Henry Griffin. The daily cause list of the Allahabad High Court for July 8, printed the name of Mr. Justice Rafique first and that of Mr. Justice Piggott next, but when their lordships sat together in the third court Mr. Justice Piggott took the senior judge's chair. We understand that there was just a mild surprise among the members of the bar present. The cause list of the 9th instant, however, printed the name of Mr. Justice Piggott first and his lordship of course took the senior judge's chair. Perhaps this much may be said in favour of Mr. Justice Piggott that Mr. Justice Rafique's appointment as gazetted is not technically speaking, permanent yet as 'His Majesty's pleasure' has still to be known though it is certain that his lordship has come to stay.—*Leader*.

MEDICAL.

A TALENTED BENGALI LADY.

Miss. Jaimini Sen, a Bengali lady doctor, has been admitted after examination as a "Fellow of the Royal Faculty of Physicians and Surgeons of Glasgow University." An L. M. & S. of the Calcutta University, she was, it seems, for about ten years lady physician to H. H. the Maharani of Nepal.

A METHOD OF OBTAINING PURE DRINKING WATER.

The use of chloride of lime for rendering water free from infection, and fit for drinking is thus described in the *Journal of the Royal Army Medical Corps*, 1911, p. 50.

(1) Take a spoonful of chloride of lime, containing about one-third available chlorine, and remove the excess of powder by rolling a pencil or other round object along the top of the spoon, or by flatter it with a penknife blade, so that the excess will be squeezed off.

(2) Dissolve the teaspoonful of chloride of lime in a cupful of water, making sure that all lumps are thoroughly broken up, and to it, in any convenient receptacle, add three more cupfuls of water.

(3) Stir up the mixture, allow to stand for a few seconds in order to let any particles settle (this stock solution if kept in a tightly stoppered bottle may be used for four or five days), and add one teaspoonful of this milky stock solution to 2 gallons of the water to be purified, in a pail or other receptacle. Stir thoroughly in order that the weak chlorine solution will come into contact with all the bacteria, and allow to stand for ten minutes. This will give approximately one-half part of free chlorine to a million parts of water, and will effectually destroy all typhoid and colon bacilli, or other dysentery producing bacilli in the water. The water will be without taste or odour, and the trace of free chlorine added rapidly disappears.

YELLOW-FEVER CARRYING MOSQUITOES.

The Indian Maritime Governments and Ceylon have been asked to put in hand arrangement for a survey in the principal ports to ascertain the extent of the prevalence of mosquitoes of the genus *Stegomyia*, which is known to be the carrier of yellow fever. It appears that there is a risk of the introduction of the disease into India on the opening of the Panama Canal next year and it is necessary to be prepared to prevent it.

CHEMISTRY OF MILK.

Professor H. C. Sherman, Columbia University, emphasized the economy of milk as a food, the cheapness of good milk as compared with a corresponding quality of other perishable foods. One quart of milk in gross food value equalled one pound of meat, or one pound or two-third dozen eggs. Anyone who could pay fifteen cents for a steak, or twenty two cents a dozen for eggs, could equally well pay fifteen cents a quart for milk.

BLUTER

The current number of the *Chronique Médical* of Paris tells of an infirmity which is prevalent in the Swiss village of Tenna, in the canton of Grisons. It appears that the majority of the inhabitants of Tenna are what is locally known as "Bluter," that is, "men who bleed." What with ordinary persons is a tiny scratch or the prick of a needle, and as such goes unnoticed, is for them a source of serious danger. They immediately suffer a hemorrhage, and it is almost impossible to stop the bleeding. It is said that the disease is hereditary. No means has yet been discovered to combat the affliction, and it is for this reason that a number of French doctors have begun seriously to examine the malady. They have established one very curious fact—that it is only men who are liable to this strange attack of hemorrhage. A mother communicates it to her sons, but never to her daughters. Up to the present no explanation has been found, and the "bluter" remain a medical mystery.—*The M. S. Journal*

SCIENCE.

RESUSCITATION FROM ELECTRIC SHOCK.

As an outcome of the discussion upon the various methods for restoring persons who have had the misfortune to meet with a severe electric shock, the American Commission on Resuscitation has advocated the adoption of the Schafer method. This decision was the result of an earnest discussion between the medical faculty and those interested in electric lighting and engineering. The medical members of the commission urged the adoption of the above, or prone, method, on the plea that it is far and away the most efficient means whereby the layman may be able to maintain respiration in a person suffering severely from electric shock. As an outcome of this discussion, the commission is preparing a chart giving details of first aid in cases of electric accidents, as well as exhaustive instructions concerning the method of applying artificial respiration by the Schafer system.—*Chambers Journal*.

DR. F. C. RAY.

Our distinguished countryman, Dr. F. C. Ray, who is now in England as a representative of the Calcutta University has been offered and has accepted the honorary Degree of D. Sc. of the University of Durham. Dr. Ray is not only a conspicuous man of Science, but is one of those representative Indians of whom it can be said without the slightest exaggeration that an honour done to them is an honour done to their country. The University of Durham is a University of Science and is situated in the heart of the coal industry.

ANTI-RINDERPEST SERUM.

Arrangements are being made for the supply of anti-rinderpest serum to the Egyptian Government from the Indian Bacteriological Institute at Muktesar.

AN INDIAN AVIATOR.

An Indian residing in England gives a short account in the *Modern Review* of Mr. S. V. Setti, the first Indian aviator. Mr. Setti is a native of Southern India, a graduate of the Rurki Engineering College and an Assistant Engineer in Mysore. In aviation he was a pupil at the "Avro" school for over three years and holds a certificate that he is a very capable flier. He designed a biplane which has been purchased by Mr. Dagon, the well-known Australian aviator. Mr. Setti believes that the science of aviation was known to the ancient Aryans in India, and he is desirous of propagating that Gospel. We do not know, says a contemporary, whether there is much field for an Indian aviator in India. According to the law, the Government have the right to confiscate any flying machine without assigning any reason and we are not certain whether Indian aviators will be encouraged by the Government. Mr. Setti is the first Indian aviator, but before the flying machine was introduced a Bengali made a successful balloon ascent and parachute descent in Lahore about twenty years ago.

A NEW INSTRUMENT.

The *Electrical World* gives an account of a new instrument which is a combination of a maximum demand indicator and an ordinary watt-hour meter. It has four meter dials, while in addition there is a large centrally-pivoted pointer which indicates the maximum demand during a half-hour interval on the circumference of the dial plate. This latter motion is worked from the gearing through a leaf spring, and is controlled by a solenoid which is energised from the line by a small contact-making motor. This solenoid sets the driving element to zero at the end of each 30-minute interval, and having done so its core descends, thus furnishing the power necessary to drive the entire register movement, the meter acting only as an escapement and regulating the speed of falling.

GENERAL.

THE NATIONAL TEMPERANCE FEDERATION.

At a meeting of the National Temperance Federation, held at Carlton Hall, Westminster, on June 11th, under the presidency of Lord Rowallan, Mr. Saravdhikary made an eloquent speech in support of the following resolution:

That in the opinion of this Federation, the direct implication of the Indian Government in the sale of intoxicating liquors and drugs resulting in the spread of intemperance in many parts of India, is indefensible.

Whilst believing that the vast majority of the people of India would warmly support prohibitory measures, this Federation urges that certain reforms demanded by the Indian National Congress, the Social Conferences, the Missionary Societies, and other public bodies in India, together with the Anglo-Indian Temperance Association and other similar societies, are immediately necessary to mitigate the evils of the present system namely:

- (1) The adoption of some effective scheme of Local Option.
- (2) A large reduction in the existing number of liquor shops.
- (3) The prohibition of the sale of intoxicating liquors and drugs to persons below the age of eighteen.
- (4) The hours of sale to be further limited by the later opening and the earlier closing of all licensed premises.
- (5) The refusal of permission to open liquor shops at fairs, festivals, and melas.

The Federation also supports (1) the establishment of excise Advisory Committees in all municipal areas; (2) the Committee to be made more directly representative of the people concerned, and to be empowered to deal with all licenses for the sale of intoxicants.

The resolution was unanimously carried.

EAST AND WEST.

The East knew of our theory of Evolution centuries before Spencer established it scientifically, or Darwin applied it to man's story, or Huxley bore down with it so aggressively on faith. It was the cardinal doctrine of the sages of India. But those calm minds, sitting beneath the palm trees by the sacred rivers, thought through the problem in whose outer meshes our hither minds are too easily detained. Their vision of Evolution only deepened the mystery of the universe. The fact of an orderly and gradual development of life, through the stages of creation, held nothing of the secret of life itself. . . . Our Western world, gone daft over the fascinating theories of Evolution, and fancying that in it is solved the problem of being in terms of matter, may turn to the sages who had divined our pet theory centuries ago, and to whom it had become a translucent symbol of the Divine Presence and action.—*Rev. R. Heber Newton in the "Message of the East."*

PRIMITIVE MEN.

Eleven skeletons of primitive men, with foreheads sloping directly back from the eyes, and with two rows of teeth in the front of the upper jaw, have been uncovered in Craigshill, at Ellensburg, Washington, U.S.A. They were found about twenty feet below the surface, twenty feet back from the face of the slope, in a cement rock formation over which was a layer of shale. The rock was perfectly dry. The jaw bones, which easily break, are so large that they will go around the face of the man of to day. The other bones are also much larger than those of the ordinary man. The femur is twenty inches long, indicating a man of eighty inches tall. The teeth in front are worn almost down to the jaw bones, due, Dr. Munson says, to eating uncooked foods and crushing hard substances with the teeth. The sloping skull shows an extremely low order of intelligence.—*Science Signings.*

THE INDIAN REVIEW.

A MONTHLY PERIODICAL DEVOTED TO THE DISCUSSION OF ALL TOPICS OF INTEREST,
PUBLISHED ABOUT THE THIRD WEEK OF EVERY MONTH.

EDITED BY MR. G. A. NATESAN.

[COPY RIGHT.]

DID THE HINDUS DISCOVER AMERICA ?

BY THE HON. ALEX. DEL MAR.

*President of the Latin-American Chamber of Commerce,
New York.*

 CURIOUS tablet of the American Mound-Builders, dug in November 1841 from an ancient mound near the intersection of Fifth and Mound Streets, Cincinnati, Ohio, has only lately been recognised as a Calendar Stone. As such, it furnishes what has long been a desideratum in American antiquities, namely an approximate date for those stupendous earth-works, both military, sepulchral and religious which have been found scattered throughout the valley of the Mississippi and its affluents. It also furnishes a reliable clue to the religion of the Mound-Builders, and points with almost unerring certainty to the country of their origin and to the circumstances connected with their arrival in America. It may be briefly stated at the outset, and with a high degree of assurance, that the Mound-Builders came from Mongolia into America sometime during the 13th century B. C., bringing with them the Shaman religion, or Worship of the Great Spirit, as typified by the Sun, and with it a knowledge of ideographic symbols, expressed by means of knotted cords, (*quipos*) similar to those used by a later race, the Peruvians, and similar, also, to the knotted cords, or "fringes" mentioned in Numbers xv, 38 and Deuteronomy xxii, 12 and still to be seen upon the praying shawls, peplums, or taliths, used by the Hebrews in the act of worship.

It makes no difference with reference to the conclusions above advanced when the Cincinnati Stone was cut, whether at the period to which it relates, such period being the important matter, or afterwards. The Stone exhibits a mode of dividing the year which prevailed during the era of Shamanism and ceased with the ascendancy or revival of Brahminism, a religion which has left definite marks in Mexico and Central and South America, and therefore could hardly have been unknown to the large and prosperous communities which had grown up in the Mississippi Valley. The chronology of the subject will receive further attention as we proceed. The Shamans divided the solar year into Eight seasons, each of 45 days, and into Twenty-four half moons, each of 15 days. Such also is the division of the Cincinnati Stone. The Eight seasons is also the division of the Muisca zodiac, dug up in New Granada. The Hindus still call the days of the Moon, *tidis*, which suggests the *ides*, or half-moons of the Etruscans and early Romans. The first of these is called *predems* which suggests *pridus*. The ninth is called *noami* or *navami*, which suggests the *nones* of the Romans. (Sonnerat, i, 249.)

It has been held that, after the establishment or re-establishment of Brahminism in Northern Asia, the solar year was divided into Ten parts, each of 36 days, and after the time of Buddha into Twelve parts, as at present. Archaeologists regard these various methods of dividing the solar year to furnish conclusive evidence concerning the period to which any given Calendar-Stone of Northern Asia relates: the Night-part calendars to Shaman; the Ten-part calendars to Brahma; the

Twelve part calendars to Krishna, or Buddha. Therefore the Cincinnati and Muisca stones relate to the Shaman worship, and to some period during or before the 13th century B. C. As this was the time of the Mahabharata war and of the great Dispersion of Northern Asiatic tribes and races occasioned by that event, it was not improbably that also of the Mongolian Migration to America. The Migration could not have been much earlier, or it would have brought with it only the archaic lunar year which preceded the era of Sun-worship. Nor could it have been much later, without bringing with it the invention of Iron, a metal which was totally unknown to the Mound-Builders of America.

THEIR REMAINS AND RELIGION.

Everybody knows about the mounds of the Mississippi Valley, how numerous and extensive they were, and what objects they contained. Enormous defensive earth works have been found all the way from the Lakes to the Gulf of Mexico, those on the Little Miami river being 10 to 25 feet high and nearly four miles in extent. Religious and sepulchral mounds are more numerous and wide spread. The mound at Brush Creek,

BUSH CREEK, OHIO.

Ohio, is built in the form of a gigantic Serpent, over a thousand feet long, holding in its jaws a monstrous Egg, measuring 160 by 80 feet, a well-known and universally recognised symbol of the Solar Year: the Serpent, by renewing its skin annually, and the Egg, by representing, as it does still, the Vernal equinox, or fresh egg time. A comprehensive survey of the mounds has demonstrated that the people who constructed them

were numerous and widely spread; that they were essentially agriculturists; that they were of the same religion, government and social customs; and that their political condition was civilised, or at least semi-civilised, having no resemblance whatever to the venatic or savage tribes, who, after some lengthy period of time, succeeded them in possession of the country. Studies made some years ago of the river terraces, especially where they were destroyed by streams which have since receded, fixed their era at some 2,000 to 3,000 years ago, a conclusion which is now corroborated and definitely settled by the Cincinnati Stone.

THE CINCINNATI STONE.

STUPEFYING WORKS IN ARKANSAS

Col Louis J. D. Pié has described the Grand Canal of the Mound Builders, which started from a little below Cape Girardeau, provided an outflow of the Mississippi to the White and St. Francis rivers, and irrigated a vast extent of country, which is now reduced to swamps. The Canal was 100 feet wide, 140 miles long, provided with towing paths, and it was crossed, at least in one place, (near Osceola, Ark.) by bridges, having brick abutments. To assist the Canal in storing the overflow, it was connected with several artificial lakes lined with adobe. Extensive courts, paved with bricks and evidently used as threshing-floors for wheat, were also found in the same vicinity.

"From a point on the Mississippi 70 miles above Memphis, along a line west from the river, there is a series of defensive works. These are earthen walls defining parallelograms and ditches and circular forts and long defensive lines. From these, the Mound-Builders were steadily driven back until the final struggle for the mastery of the country, and for national and personal existence, was fought, five miles above the point of confluence of Little Red and White rivers. A broad deep ditch connects the two streams, and buried within, it is said, are myriads of Mound-Builders' skeletons. I am credibly informed by one who traversed this battle-field and scanned it closely, and dug into the deep receptacle, that an entire population must have fallen there."

A BURIED CITY.

Thus far, Du Pré. But other men have also explored the swamps of Arkansas, and found there strange remains. One of the Lamars of Mississippi who perished in the civil war and who had frequently hunted in the forests of that little explored region, came back, it is said, with stories of a Buried City of vast extent and, what is more, brought away memorials of it which are said to have been so numerous as almost to fill his house. What was the character of these memorials, or what became of them, though enquiry has been made in proper quarters, has not been ascertained. The fact that no account of them has been found in the usual works of reference, forbids the story to be used in evidence, without further corroboration. One thing is certain, not only of Arkansas, but of the Mound-Builders' empire everywhere, they left no structural monuments; at least, none have been found. If the theory advanced by Ferguson, in his "History of Architecture" can be relied upon, namely, that the absence of structural monuments or built-up temples is peculiar to the Turanian races in every part of the world, then the Mound-Builders were Turanians. This is corroborated by other evidences, without which it would be hazardous to apply Mr. Ferguson's theory to the Mound Builders. They were undoubtedly Mongolians and Mongolians are com-

monly classed as Turanians. But were not also the Central American tribes Turanian and did they not build structural monuments, those magnificent temples which still rear their hoary heads in the gloomy forests of Honduras and Nicaragua? Whether the Mound-Builders were Turanians or not, their arts and religious ideas were evidently brought from Hindustan.

HINDU DEITIES IN THE MOUNDS.

This opinion is based upon the fact that several images of Buddha, or Krishna, (whichever they are,) have been found in the American mounds, a drawing of one of them, taken from a photo published by the U. S. Smithsonian Institution, accompanying this paper. *Although this image,

BIG TOCO MOUND, TENNESSEE.

unlike the others, is headless, it is really the most important one, because it is engraved on a tortoise shell of an indigenous species and therefore was probably executed in America by a Hindu artist.

*From "The Swastika," by Dr. Thomas Wilson, U.S. Nat. Hist. Mus., Smithsonian Institute, Washington, 1896, p. 220.

from the Pacific to the Mississippi, that is readily indicated. In 1750 the French missionaries in Louisiana heard of a route from the Pacific which was used by the natives, and to test the accuracy of their information, they sent an Indian over the trail, who made his way to the Ocean by the Missouri and Columbia rivers, and came back with the report that at the mouth of the latter he saw a sailing junk, whose pig-tailed crew were busy washing the river sands for gold. This was evidently a Chinese or Manchurian vessel, more likely the latter. The wrecks of similar vessels have since been picked up at various points on the shores of British Columbia, Oregon and California.

A GRAND PRIZE FOR THE LUCKY GUESSER.

Various attempts have been made to read the ideographs of the Mayas and Aztecs, but as yet they have not been attended with success. M. Plongeon, a French explorer of the Central American ruins, made out a number of plausible readings, which however have not been rewarded with any sign of approval from men of scientific rank. The want of a key, like that which the Rosetta Stone furnished to the hieroglyphs of Egypt, is very severely felt. No attempt has yet been made to discover such a key through the medium of the Hebrew *qumran*, and as the method of knotting these and the signs they denote are well known, the neglect is rather surprising. Perhaps some learned rabbi may hereafter unravel the mystery for us, or it may come to us through the ideographs of the Hittites. Meanwhile it remains a puzzle, for the solution of which the discoverer will undoubtedly be rewarded with both honor and fame. The principal authorities to be consulted are Humboldt's *Works* and Lord Kingsborough's *Collection*; but as the latter is based on a prejudice and the pages are carelessly arranged and much confused, it will be safer and certainly more interesting to stick to Humboldt. Boturini's *Collection* is also of

great value. The Natural History Museum in New York contains numerous examples of original picture-writings and native inscriptions in bas-relief, all of which await translation.

THE EDUCATIONAL PROBLEM IN INDIA.

BY RAI BAHADUR LALA BAJNATH.

THE educational problem is daily becoming the chief problem of India, and what with attempts at formation of new Universities, introduction of residential teaching in the existing ones, the spread of education amongst the depressed classes and the masses through compulsory education, the best intellects of the country are all being directed towards it. The Government is also giving its share of attention, though its point of view is different in many respects from that of the people. The chief point for consideration however is not only the spread of education but also the direction of the existing system on right lines, so as to prevent its doing the injury it is doing to our healths and future well being as a people. I have lately been in correspondence with some of our best educationists and medical men on the subject and give the results of their experience in this short paper.

Medical men who have given attention to the subject are as keen in denouncing the present system of education as those who are its victims. Students have written to me in piteous tones as to how their energies are being undermined by the system. Their professors say the same. One student from Madras says that the University there in their anxiety for specialization of subjects, have quite ignored the conditions under which Indian students live. In the Punjab, Bengal, United Provinces, and Madras, students complain of the University courses being too long to be completed during the term and of their having too many books

which it is quite useless to read and master. A learned doctor, an I. M. S., while admitting the evil effects of child marriages thinks that they have become "aggravated by the lowering of vitality caused by undue pressure on the brain and the nervous system in early age, by the educational methods in vogue". Regarding the system of examinations he says, "The system of examinations which is in vogue in this country must be looked upon as the great factor in the degeneracy of the educated classes. Despondency seems to be stamped on the face of almost every one, one comes across in India." This shows that solution of the educational question lies at the root of all our future well-being as a nation and the sooner the attempt is made to solve it the better.

The points for consideration are:—

(1) whether the complaints I have noted above do in fact exist throughout the whole of India, or not;

(2) how can they be removed, whether by the establishment of new and more private schools, *gurukulas*, residential universities or by urging for reform in the rules, regulations and standards of existing institutions;

(3) whether any agency like an Educational Conference, Council or League for the whole of India or for each province, will be an effective means of removing the complaints;

(4) if such a body is to come into existence, on what lines should it be formed so as to be a really effective working body, and not like many other associations which are already existing in the country or daily springing up, only to languish into obscurity or die of inanition.

If a small number of men who are actively engaged in the work of education, were to unite and co-operate with a number of laymen who are interested in, and give their thought to the subject, discuss and exchange their views from time to time and formulate them for public considera-

tion, some good might come out of their efforts.

In all progressive countries of the West there are societies, associations which guide and control the education of their youth. In the United States of America the National Educational Association is a very active body, consisting of six thousand members, with a fund of 1,70,10,000 dollars and an annual income of about 63 lacs. This association has been in existence for about 50 years and concerns itself with the progress of education in all its branches. "The commanding position of the American people" says their Report for 1909 "being largely due to the diffusion of knowledge and culture through its free schools, the association concerns itself not only with state supported elementary, secondary, training schools and universities, but also with free schools whose purpose shall be the training of our youth for commerce and the industries as well as for the professions. These schools must advance on the lines of commercial democracy in that they should provide equal educational opportunities for all." The association has corresponding members in almost all countries of Europe, from amongst specialists in educational matters. It has nine regular departments including superintendence, professional preparation of teachers, elementary, secondary, higher industrial, and musical education. An association like this seems to be much wanted in India. In England also there is an Association for National education, whose object is "the promotion of national education which shall be efficient, progressive, unsectarian, and under popular control." The association is controlled by a body of 300 members, representing all parts of England and Wales and is presided over by Lord Stanley of Alderley. In Bengal they have a Council of National Education with a College and a School, but it has not yet succeeded in making much headway in educational matters, nor secured recognition of its views and representations from Government. The Mahomedan Edu-

THE LATE MIKADO.

THE NEW MIKADO

HIS MAJESTY THE NEW MIKADO.

BY

MR. SAINT NIHAL SINGH.

HERE a lesser man stepping into the shoes of his late Imperial Majesty Mutsuhito, than his august son Haru-no-Miya Yoshi-Hito, we might well sympathise with him, for the successor of so illustrious a personage as the late Mikado of Japan, who, on his succession to the throne on February 13, 1867, found his kingdom weak and insular, sunk in the mire of mediocrity and feudalism, and out of touch with the rest of the world, and who helped it to become a strong and progressive empire, respected throughout the world for its military and naval power, industrial organisation and intellectual accomplishment, would be apt to suffer from having his feet thrust into shoes many sizes too big for him. But the new Emperor, by reason of his character, capabilities, and education, even though he follows, as he does, immediately after the maker of new Nippon, is not likely to appear dwarfed merely because of the brilliancy of his predecessor.

Born in August 31st, 1879, his Majesty Haru-no-Miya Yoshi-Hito entered the mundane world at a time when the Occidental influences, acting upon Oriental institutions, were rapidly demolishing the old-time ideas of divine right and Asiatic conservatism. For twenty years people from foreign lands not only had been permitted to enter the Land of the Rising Sun without being molested by the insular natives, but some of them had actually been engaged by the Government to impart modern education to the Nipponese and instruct them in Western letters, arts, industrialism, and commercialism. For a score of years Japanese men of promise had been journeying to the remote corners of the globe to learn new methods with a view to introducing them into their home-land. For nearly a decade an organised

State department had been providing modern instruction to the rising generation of boys and girls. Ever since 1868, when, as the result of a sanguinary civil war, his father, the late Mutsuhito, was restored to actual power instead of continuing to be a mere puppet in the hands of the usurping Shogun, feudalism, which for centuries had reigned supreme over the Day-break Kingdom had been gradually dissolving; the Government had been progressively reconstructed according to Western patterns; and every attempt had been made to educate the people so that eventually they would be able to administer their own affairs instead of being, as theretofore, autocratically ruled, as if they were so many dumb animals. Thus the atmosphere which Yoshi-Hito inhaled into his lungs with his first breath was saturated with the ozone of occidentalism, in which notions of semi divinity could not live, much less thrive. The psychological effect of these circumstances doubtless was to draw him down from the cloud land of the gods in which his own father, as well as his 120 odd predecessors had been born and reared, and impress him with the fact that, though he had been fore-ordained by Providence to rule over more than 162,000 square miles of territory, peopled by 55,000,000 souls, and despite his reputed descent from *Kami*, the Goddess of Light, he was, in the last analysis, made of common clay, just like other mortals, and was to be a limited monarch, responsible to his ministers and subjects for his administrative (and, in a measure, private) acts, instead of being an autocratic potentate of the old Oriental type.

Hitherto it had been the practice of the Royal family of Japan that, when the Imperial Princes reached the age when their schooling should commence, special instructors were appointed to carry on their education at home. But Yoshi-Hito had been born in an age such as no son of any other sovereign of Japan ever had lived in, and his

father wisely ruled that the child be sent to school instead of the school being brought to him.

The academy selected for this purpose was the *Gaku Shū in*, or "Peers' School." The late Mutsuhito himself had suggested the establishment of this institution, which was founded in 1877 by a committee of Nobles, exclusively to carry on the education of the sons and daughters of the nobility. In 1884, at the bidding of the Emperor, it was taken over by the Household Department of the Imperial Palace, and from thenceforward ceased to be a private school. A year later a separate academy was opened for the education of the daughters of Nobles, the *Gaku-Shū in* being reserved for the training of the boys of the gentry. In view of the fact that the authorities permitted the sons of men who could not claim noble blood and were unable to prove their descent from famous families of ancient lineage, but who occupied positions of influence in the social and political worlds, to enter its doors, the Peers' School was not of as exclusive a character as its rather grandiloquent name would suggest. Indeed, it was not very much dissimilar to some of the public schools of England where the sons of blue blooded received education side by side with the progeny of "tradesmen." Be this as it may, at any rate the sending of the son of the Mikado to even an institution of this nature was a step distinctively in favour of less exclusiveness. Bearing in mind the fact that but a little more than a score of years before Mutsuhito lived in complete seclusion, and even at that time his subjects did not dare to gaze on his face, this, indeed, was an epoch-making innovation.

The late Emperor not only sent the Prince to the *Gaku Shū in*, but also laid down that his child should be treated exactly the same as were the other boys studying at the Peers' School. In conformity with this Imperial mandate, Yoshi-Hito, all the time he was at the academy, was subjected to precisely the same discipline and

made to follow exactly the same curriculum and take part in the same physical exercises and games that were prescribed for his classmates of lesser degree than himself.

Sometime later the Prince's poor health rendered it imperative that he should be withdrawn from the Peers' School in order that he might be able to spend all his time in the palace under the observation of the physicians, who were directed to spare no effort to build up his frail physique. It was with extreme reluctance that the late Mutsuhito acquiesced in this arrangement, and even then he would not permit his son's education to stop, but appointed a special staff of teachers to carry on his instruction. However, the good-fellowship of the school, even though he was subjected to it for a short time only, undoubtedly had a democratizing influence upon the future Mikado, and moulded his plastic young mind in a different cast from that of any of his predecessors, leaving an indelible mark upon his character.

Since his two older brothers had died, Yoshi-Hito, the only remaining son of the Emperor, was nominated Heir Apparent on August 31st, 1887, on his eighth birthday, and was proclaimed Crown Prince, on November 3rd, 1888. This ceremony was not rendered necessary, as some erroneously believe, because of the fact that he, the sole surviving male child of Mutsuhito, was not the progeny of the Empress Haruko, but was the son of a secondary wife, Madame Yanagiwara. As a matter of fact this procedure was customary in all cases, whether the ruler's son was the child of the Empress or not. It may be remarked en passant, that none of the daughters of the late Mikado is the child of the Empress Haruko, but are his progeny by subsidiary wives, twelve of whom are permitted to the Emperor. Similarly the two Imperial sons who died were not the children of the present Dowager Empress.

At the time Yoshi-Hito was proclaimed Crown Prince, he was decorated with the Grand Order of

Merit and the Grand Insignia of the Imperial Chrysanthemum, and was appointed an ensign in the Imperial Body-Guard Infantry. He was a Captain until, in 1898, he became Major, the same day being made a Lieutenant-Commander in the Navy.

In 1900 a new influence came into the life of Prince Yoshi-Hito in the shape of a woman who, it would seem, had been especially prepared by Providence to be the democratic wife of the first democratic and monogamous Mikado of Japan and to fill his existence so completely that there would be no question of secondary wives. She was the Princess Sadako, one of the younger daughters of Prince Kujo Michitaka, belonging to one of the five families of nobility from amongst whom custom compels the sons of the Japanese Ruler to choose their brides.

There had been a bare possibility that the oldest daughter of his family might be chosen as the consort of the Crown Prince, and for a long time her betrothal was postponed in the hope that she might become the prospective first lady of Japan. But when finally no proposal emanated from the Imperial palace, all hope was abandoned, and she married another man. It so happened that a match between the daughter next in age and the Ruler's son according to the superstition of the Day-break Kingdom, would have been deemed most unlucky, and she, therefore, never was considered for the honour.

Little Princess Sadako was left. She was so much younger than the Imperial Prince that it never occurred to her family that she might be chosen to fill the position that any girl of the sunrise Kingdom would have coveted and therefore no special attempt was made to train her to fill it. As a little child she was sent into the country where she abided under the care of a farmer's family, plying about in gay abandon, bare-headed and bare footed, finding her companionship in the poor children of the district round about, growing

up to be healthy and happy, familiar with and sympathetic toward the needs of the peasantry and country-folk. When old enough she was sent to the Peersesses' School in Tokyo, and there she was the soul of gaiety, engaging with avidity in sports of all kinds.

She was a student at this institution when, all of a sudden, her father received the command that she be consort of the Crown Prince. At that time Princess Sadako was fifteen years of age. Immediately her father built a new suite of rooms for her residence so long as she remained unmarried and exquisitely furnished them throughout especially for her. There she lived during the eight months previous to her marriage to the Crown Prince in solitude, eating, all alone, the meal that had been cooked just for her, and that were served on dishes that had been bought for her sole use. All her relations, including her father and mother, kept a respectful distance from her, not daring to speak to her or associate with her as had been their wont previous to the announcement of the engagement. To them she was a being apart, as far distant as if she already had become their Empress, and all they could do was to worship and serve her. The fine new cloths she wore had been bought for her as soon as the choice was made known. She was immediately withdrawn from the Peersesses' School, and private tutors were appointed to teach her subjects calculated to fit her for the dignity of the position she so unexpectedly had been called upon to occupy.

On May 10th, 1900, the young girl became the Crown Princess of Japan. Several innovations marked the event. To begin with, for the first time in the annals of the land the Imperial bridegroom asked the bride's father for her hand at the altar, instead of taking it for granted that the girl's family felt honoured by his accepting her as his consort; and Prince Kujo Michitaka solemnly gave Princess Sadako away, just as is done in the West. For the first time in the history of the

little Island Empire the marriage ceremony was made something more than a mere contract, as theretofore had been the case, a special religious ritual having been arranged for the occasion. The wedding was witnessed by the members of the Royal family and by two other Japanese, Baron Sarinomiya, the Grand Master of Ceremonies, and a lady-in-waiting, who took part in the rites behind the curtain of the holy of holies. The bride and bridegroom, after exchanging the old fashioned native Court costumes in which they were wedded for European dress, seated side by side, drove to the palace that had been set apart for their residence. On the same afternoon the Emperor gave a party in their honour which was attended by the diplomats in Tokyo and the high dignitaries of Japan. The bride, dressed in white brocade, leaning on the arm of her Imperial husband, in naval uniform, went to the function just as any Occidental couple would go to their wedding reception—a stupendous innovation in Japan of that time.

From the day of their marriage to the present moment Yoshi Hito and his wife have been inseparable companions. Much to the consternation and disapproval of the old fashioned courtiers, they have taken their meals together, driven together, and attended State and social functions together. The new Emperor always insists that his wife shall enter the carriage ahead of him, and gives her unusual precedence at other times. It must be added that this is not done for mere show. Indeed, his Majesty accords the same courtesy to her Majesty whether in public or in private. It is superfluous to add that the present Empress is the sole consort of the Mikado, he having consistently refused to take advantage of the centuries-old privilege of having subsidiary wives.

Three children have blessed their union. The eldest, the present Crown Prince, is Hirohito, Michi-no-Miya, a little over eleven years old. The

second son, Yasuhito, Atsu-no-Miya, was born on June 25th, 1902. The youngest, Nobuhito, Tero-no-Miya, was born on January 3rd, 1905.

As the result of his democratic tendencies, Yoshi Hito has rent the curtain that hid the ruler in holy sanctuary away from the sight of his people, who were not permitted to gaze upon his face or utter his name, and who worshipped him literally as the *Tenno* "Heavenly Ruler," and *Tensho* (Son of Heaven). He has laughed defiance at ages old customs, and has mixed with his subjects as no other monarch of Japan ever did. His greatest pleasure lay in walking the city streets, listening to what the populace had to say, and studying Nipponese life at first hand instead of depending upon hearsay or books for his information. As Crown Prince he preferred to serve himself rather than be waited on by others. If he took out his pet dog for an airing, he held the leash in his own hand instead of turning it over to the care of a lackey. He enjoyed riding a bicycle or a horse, or driving himself about in a trap or a motor car, refusing to ride about in state accompanied by a number of attendants and preceded and followed by a guard of honour. He even overthrew tradition to the extent of engaging in business ventures, not even hesitating to have dealings with a foreign corporation.

When it is considered that a half-century ago probably not a dozen people outside the royal family had looked upon the Emperor's face, the boldness of Yoshi-Hito will be realised. Unfortunately the late Mikado, in spite of his progressive ideas, never was able entirely to do away with the old customs, and he remained to the day of his death more or less hidden from the sight of the common people, although he permitted those of high rank and dignity to look upon him whereas his predecessors refused to do so.

Yoshi Hito, it must be remembered, has done all these things while he still was merely the

Crown Prince. It is not unreasonable to believe that he will show even greater democracy now that he has ascended the throne.

The Emperor of Japan enjoys a civil list of Rs. 45,00,000. This is a very small sum of money compared with the civil lists of European monarchs. Even some of our own Maharajas possessing not a tithe of the territory or subjects ruled over by the Mikado, set apart money for their own use on a comparatively more munificent scale than he does. Not only is the Japanese household exchequer small, but the demands thereon are large and varied. All of the princely families, including that of the Crown Prince, are supported from the Imperial purse. The Emperor is expected to make presents of large sums along with all patents of nobility; to supplement the salaries of the Cabinet Ministers with handsome allowances; to pay all the honoraria that accompany orders and medals; to donate immense sums to charities of various descriptions, many of which are of such a nature as to pass unnoticed by the public; and to spend large sums in order to encourage indigenous art. It may, however, be added that the late Mikado managed his civil list so well and took such good care of his personal property that it is estimated he left Rs. 6,00,00,000 in cash and real estate, a large part of which came into the possession of the present Emperor. The dead monarch was able to do this because he led a life devoid of all luxury and even of many comforts. His son and successor, having been brought up in even a more democratic school than his father, leads a simpler, though in many respects a much more modernised life.

It so happens that it is an absolute necessity for the new Emperor of Nippon to be a man of deep sympathies with the common people, owing to the peculiar circumstances existing to-day in the Land of the Rising Sun. The Government of Japan continues to be an oligarchy, dominated by a few men who are known as the "Elder Statesmen,"

in spite of the fact that a Constitution was granted in 1889, and that an elected House of Parliament has been in existence for a score of years. The rapid spread of education, the constant flow of foreigners into the country, and the journeying of Japanese students and emigrants to the four corners of the globe to learn the ways of the West, have given rise to an insatiable desire in the hearts of the populace for the opportunity to wield the power that has been kept under the control of the ruling coterie. The costly war which Nippon waged with Russia in Manchuria, and the equally extravagant ambition to fortify itself with an invincible army and navy, have been the cause of rendering taxation burdensome, and have made the work of financing the Administration excessively arduous. Simultaneously, the pressure of population has increased, and though a considerable number of Japanese have emigrated, still the increase of inhabitants has been great for such a small land, and has brought perplexing problems in its train. The cost of living has risen higher and higher. The only thing that will remedy the present political difficulties in Japan will be the granting of concessions to the people at large and the lowering of taxes. If this is not done, anarchism, which already has lured numbers of hot-headed young men into its ranks, will make more converts; the spread of socialism is rapid, and it is attracting larger and larger numbers of Japanese to its ranks. Though the present political problem may be considered by some to be less baffling than that which perplexed the late Mutsuhito at the beginning of his career as the *de facto* ruler, yet for apparent reasons, it is not easy to solve. It appears that the only remedy lies in the decentralisation of the powers which the oligarchs of Nippon to day are enjoying, just as the late Emperor sacrificed his autocratic privileges on the altar of public good. The Mikado, in virtue of his high position and heritage, is destined to take a leading part in this important political

move, and the saving of the situation depends to a large extent upon whether or not he is democratic in the spirit of his reforms.

The new Emperor, having been connected with different departments of the Government for many years, comes to the throne well prepared for his work. He was made Lieutenant Colonel and Commander in the Navy on the occasion of his father's birthday, on November 3rd, 1901. Again in 1903, in honour of the same event, he was made Colonel and simultaneously Captain in the Navy. On November 3rd, 1909, he became a Lieutenant General of the soldiery and a Vice-Admiral. Of course strictly speaking these positions have been honorary, but nevertheless his Majesty has had the chance to get an insight into military and naval matters. He has had ample opportunity to acquaint himself with Parliamentary usages. Indeed, without exaggeration it may be pointed out that no Mikado has come to the throne so well prepared for his duties as the Emperor who succeeded the late Mutsuhito on his demise on July 30th, 1912.

Judging from the character of his training, it is my settled conviction that the reign of his Majesty Yoshi Hito (which, by the way, is to be known as *Taisho*, "Era of Great Resolutions") will be distinguished by a marked development of self government in *Daï Nippon*.

KAMI-NO-MICHI. The way of the Gods in Japan by Hope Huntly. Price Rs 2-4.

The desire of the author is to guide her readers faithfully along this hitherto honored, half obliterated "Way of the Gods", clearing the path with reverent, not iconoclastic hands, because recognizing it as the Way by which the Japanese were divinely led to their present mental altitude. The path is traced in threefold aspect Ethical, Philosophical, and Romantic.

The story trends towards a sensational crisis in order to emphasise life portraits known to the author while resident in the country.

WAR AGAINST PHTHISIS.

BY

DR. J. N. BAHADURJI.

IFE is beset with dangers. With the advance of civilisation and science the dangers of the denizens of the woods have been considerably reduced, even in tropical climes. But while the toll of lives these visible foes of mankind have levied has been heavy, and is constantly decreasing, the mortality inflicted by the invisible enemies of humanity—the disease germs—has been far heavier and progressively increasing. These latter are more numerous than the beasts of the jungle, countless as the stars with which the vault of the heavens is studded. Within the space of an inch millions of them can be accommodated. While the wild beasts have fled before the advance of man, the germs seek him out for attack. They need no limbs to carry them to battle. Floating through air and water, two of the necessities of life, they so insidiously enter the body of their victim and engage in battle with the white bodies of human blood, that their presence is not suspected till their onslaught effects more or less serious aberration from the normal in the condition of their victim. Besides the two elements, air and water, they press into their service insects such as the house fly, the aeroplane on which they ride to their host's third necessary of life—food. They even utilise for the purpose of effecting an entry into the human system intermediate hosts who transfer them into the human blood by means of their proboscis as effectively as a hypodermic Syringe.

Such are our unseen enemies and such are their resources. Were it not for them the realm of disease would be contracted. There would be no diseases but such as result from excesses in eating and drinking, and exposure to extremes of temperature.

In the pre-microscopic age these unseen foes had defied us, and though they still defy us, our victory over them is assured at no very distant date, for the microscope has laid bare their forms, their habits, their modes of multiplication, their cycle of existence. This knowledge has been slowly gained and is being steadily added to with immense possibilities for the good of mankind.

Some species of these microbes and microscopic parasites are more prevalent in some countries than in others, some are confined to special regions, but the freer intercourse between the various races of mankind tends to exchange these specialities with the exchange of trade, rendering them objects of common danger to all mankind.

One particular species with which this article is intended to specially deal is the Tubercle Bacillus. This is very formidable in as much as it is the most widespread of all. No country in the world has escaped from its ravages. And probably at some future date it may be proved that every human being at some period or other of his existence has sheltered and battled with it. For traces of its domicile have been discovered post mortem in numerous bodies the victims of diseases other than tuberculosis. It spares neither infants, adolescents, nor the aged. From the most tough to the most delicate structure in the human anatomy—all are liable to be seats of its destructive activities. The homes of many thousands annually in each country on the face of the map are rendered desolate by its onslaughts. The world of literature and of art has been robbed of many of its best talents by its depredations.

For over a century the Scientific and Progressive West had been content to bow its head low to the blast of this pest and accept its sway undisputed and with resignation. With the growth of materialism and the spirit of inquiry diseases ceased to be regarded in the West as special visitations of Providence, and brains have been busy

there to find out the ways and means of combating disease in all its forms. War is now waged against Tuberculosis in all the progressive states of the West.

The once somnolent East has been roused to industrial activity. Will it still be content to be "plunged in thought" in matters of sanitation and preventive medicine, letting these hordes of tubercle and other germs lay waste families by the thousands?

Effective sanitation means improved health of the community reacting favourably on the production of wealth.

The sanitary conscience of the Government has been roused these many years. Municipalities and Local Boards are doing their share of sanitary work. But without co-operation from the people themselves not only is sanitary work rendered difficult, but it is even nullified on many occasions. Anti-tuberculosis leagues have been formed in the West to educate the people in the methods of fighting this fell disease.

Bombay under the patronage of its respected and popular Governor has followed suit. A munificent donation from the ever openhanded citizen Mr. Ratan Tata has set the league on its feet. Bombay's example needs to be followed all over India until every town and every village in India has its own league, so that concerted measures may be taken against Tuberculosis, which step alone can effectively check the growth and spread of this disease and ultimately stamp it out. For as long as breeding spots exist in the country they will stand menacing the rest of the country.

Sanitary measures against Tuberculosis are based on two considerations.

Sunlight and fresh air are inimical to the life and growth of the tubercle bacillus. Darkness and deficient or total lack of ventilation are factors in promoting its growth.

Few are the days when the sun is not visible in the Indian sky. But God made the country

and Man made the town. We have plenty of air and sunlight outside the house, but overcrowding and deficient ventilation are the common conditions of most of the houses in every city and most of the huts in every village. The first step in the campaign against Tuberculosis must therefore be the provision of well aired and well lighted tenements for the masses. Where municipalities are powerless to cope with the rapacity or ignorance of landlords the aid of special legislation should be invoked.

Over crowding and insufficient light and air ventilation are factors which legislation will go a great way to remove. But there are other causes at work which promote the growth and spread of disease germs. For these the habits of the masses are responsible. One of these habits is the stuffing up of every crevice of ventilation, should any have been provided, when the ordinary Indian of the working class goes to sleep.

Education in elementary personal hygiene and sanitation must therefore be spread amongst the masses. Although, as long as primary education is not made universal and compulsory, much of the effort spent in teaching the elements of hygiene to the masses will fall on barren soil, nevertheless the section of the community that has gone through schooling will derive benefit therefrom and may be expected to influence the uneducated by their example.

Another habit harmful to the health of the community, and, besides, very filthy, is that of spitting, particularly inside the houses. Who is not familiar with the pink patterns on floors, walls, staircases of houses in Bombay caused by the intermittent squirts of betel juice mixed with saliva? A common staircase often also invites pellets of expectorations coughed up by residents or visitors as they pass up and down the stairs. Should the offenders be the victims of phthisis they in this way infect millions of tubercle bacilli, which, when the expectoration dries up, pervade the atmosphere

to the detriment of the healthy. This is a habit which is almost universal in India not only amongst the manual workers, but amongst people higher in the social scale, and a determined campaign needs to be waged against it to eradicate it and with it the chief cause of the spread of infection amongst adults.

Amongst infants and children the chief source of infection is the milk supply—Periodic inspection of milch cattle is a *sine qua non* for the check and ultimate stamping out of most intestinal infant diseases as well as tuberculosis. All milch cattle discovered suffering from bovine tuberculosis must be destroyed. Should the existing legislation not meet the case, special laws should be passed investing the medical officer of health with the necessary powers.

We have seen that certain insects carry infection to humans. A campaign of extermination of such insects is therefore of the greatest importance. Life, however, in every form is held sacred by most Hindu sects. This measure, therefore, will not be popular and will not be thoroughly carried out. Nevertheless, the spread of knowledge of the dangers to human life which lurk camouflaged in the delicate legs or wings of these insects may ultimately rouse the instinct of self-preservation to disregard the dictates of a custom bound or religion-bound conscience. The aid of children for this purpose will be invaluable, for in them the destructive instinct is generally paramount, and they may therefore be with advantage imbued with a taste for war against these pests.

The nature of the infection and the mode of its spread being known, the above preventive measures will naturally suggest themselves to intelligent laymen.

But these measures do not exhaust the list in the mind of the professional man. The latter advances compulsory notification of cases of phthisis, and with very good reasons. For the

infection of phthisis may be communicated from humans to humans. With compulsory notification must be associated compulsory isolation.

The well-to-do may be permitted to carry out this measure in their own homes, but, for the poor, isolation hospitals will have to be established to prevent the spread of the infection to the healthy. Private munificence cannot have a better object for support than such hospitals, for apart from circumscribing the infection they will be the means of keeping hundreds of thousands of our suffering fellow-creatures in comfort, and of restoring a certain proportion of these to health and active life. As early diagnosis is essential to the cure of tuberculosis periodical inspection of school children, undergraduates in colleges, factory hands and bodies of men under a single employer or serving in business houses is a preventive measure of the utmost importance.

Another important preventive measure that follows as a corollary to isolation is the discouraging and ultimately legal prohibition of marriages of the phthisical. It is true that the tubercle bacillus is not directly transmitted from the parent to the progeny, but the susceptibility in the latter born of a phthisical parent or parents is greater than that of the progeny of the healthy. Some maintain that a certain amount of immunity is conferred on the progeny by phthisical parents. But the fact that in most cases of phthisis there is a clear history of the disease in some one of the progenitors discounts this theory of immunity. There are two measures essentially directed to the cure of tuberculosis which do not strictly fall in the category of prevention. But in as much as they are intended for the destruction or neutralisation of the infection of tuberculosis, and as moreover they form part of the programme of work of an anti-tuberculosis league they need to be considered in this article.

These measures are the establishment of sanatoria and tuberculin dispensaries for the cure

of tuberculosis. The former are admittedly more expensive but they will provide the isolation so necessary for the prevention of the spread of the disease, and are therefore necessary. They can serve the double purpose of isolation and cure. Tuberculin dispensaries are cheaper and in as much as they can be established in various centres of a town facilities for treatment in the early stages of the disease are provided at the people's doors. The two are therefore complementary measures and must each have a place in any scheme of campaign against tuberculosis.

Much therefore can be done for the relief of misery and the cure of those sick with tuberculosis provided money is forthcoming. Will those endowed with more than is sufficient for their needs or their children's needs come forward with the sinews of war? While sanitation and mass education fall within the province of the State, the relief of suffering humanity has claims upon the philanthropy of the affluent. Organised charity can effect more good than the random feeding of millions of sturdy strong limbed professional beggars with which this country is overrun. How many doles from the charitably inclined are in this country daily directed into the pockets of the unworthy is a matter of common knowledge. Is it impossible to divert a portion of this perennial stream of charity into a general fund for the war against phthisis?

THE DOCTOR AT HOME. Over 600 pp. Rs. 3-12. With 16 Coloured and other Plates.

THE ENQUIRER'S HOME BOOK. A complete Guide for every branch of Domestic Life including Amateur Work, Cookery, Electricity, Furnishing, Games, Gardening, House-Decorating, Legal Matters, Medical Matters, Needle Work, Paper-Hanging, Sports, Writing Etc., illustrated with 17 full page plates. Price Rs. 3-12.

GREAT ENCYCLOPÆDIA OF HEALTH AND DISEASE: "THE HOME BOOK OF MODERN MEDICINE." By J. H. Kellogg, M. D. (An Eminent Physician of Wide Experience) 500 Illustrations; 30 Coloured Plates, Artotypes, and Manikin of the Human Body in Seven Colours. Two Volumes, Rs. 23-8-0.

G. A. Natesan & Co., Sunkurama Chetty Street, Madras,

rule became most marked in the regime of Lord Lytton. All the acts of that regime, from the wasteful expenditure of revenue on the Frontier policy to the abolition of cotton duties, came in for a sharp criticism at the hands of the non-official public opinion both Indian and European.

Some of Telang's remarkable utterances were delivered at public meetings held to protest against the reactionary measures of Lord Lytton. These utterances reveal at once the sobriety, the self-restraint, the power of close reasoning and penetrating criticism, all pervaded by a vein of subtle humour. The expression is remarkably lucid, and singularly absent from "the foppishness of sentiment."

What were the reactionary measures of Lord Lytton that brought home keenly to the people for the first time, the radical defects of a government in which the people had no voice and in which as a consequence the fundamental maxim of good government ran the utmost risk of being systematically violated?

The first act of Lord Lytton's regime that came in for a severe condemnation at the hands of the people was the Revenue Jurisdiction Bill of 1876, a bill that was opposed by the High Court, the Bombay Government and the people at large and that was passed in the teeth of that opposition. The Bill "transferred the cognizance of disputes in which the fisc was concerned from the civil courts to the revenue officers."

At a meeting held to petition the Secretary of State to withhold his sanction to the Bill, Telang made a speech much praised by the Gazette for its lucidity. From that speech we cull the following passage which admirably sums up his view on the subject.

The bill marks a tendency to bring people back to the days of personal government. It is objectionable on the ground that it vests in the Revenue officers' authority which they ought not to have, and takes away from the civil courts a power which they ought to have against arbitrary action by revenue officers. It is not enough to be just, the officers must seem just. In the hands of the judges, the rights of the ryots were perfectly safe; in the hands of the Revenue officers, though they might be so, the ryots themselves will not believe them to be so and that is a very strong reason why the Bill should be condemned.

The next speech which Telang delivered was on the License Tax levied in 1878 to contribute towards the formation of the Famine Insurance Fund. A meeting was held in the tent of Wilson's Circus, as the use of Town Hall was refused for the purpose by the Government, to memorialize to the House of Commons against the

tax. It was shown "that the tax was faulty in its details and odious in the principle; that it struck too low and exempted on the one hand high officials and on the other men of the learned professions."

It was levied on traders who were the greatest contributors to indirect taxation and on agriculturists who were already heavily-burdened with the enhanced duty on salt and who were already paying the land tax. Telang showed the arbitrariness and absurdity of the tax by these remarks —

The grounds on which the proposal to levy this tax is based are first that those who have taken such great pains in meeting the famine are not the proper persons to be taxed in order to defray the expenditure that has been incurred.

2. That in as much as these officers of Government are not to be taxed, therefore all other government officers shall not be taxed and people who may in some sense be supposed to stand in the same position ought not to be taxed? Because these ought not to be taxed therefore the professional classes should not be taxed. Naturally enough the only persons fit to bear the burden of taxation were the traders and the agriculturists.

The next measure of Lord Lytton's that roused the bitter opposition of the public was the Vernacular Press Act, other wise known as the Gagging Act. Mr. Telang condemned the measure in a series of articles to the *Hindu Prakash* and said:—

It appears to us to be descent from the higher level of political status which under the wiser British Government, we had already reached, into the slough of patriarchal rule and personal Government. If there was one thing more than another to which an advocate of the British Government could point as marking unmistakably the superiority of it to by-gone governments, it was after the liberty of speech and thought, this reign of law—liberty of speech, which is now become to a considerable extent a thing of the past under the provisions of the Gagging Act. The reign of law is passed, ceasing under the hands of these sapient legislators who have been ruling the past few years.

From the Vernacular Press Act, we pass on to the abolition of import duties on cotton. The duties were abolished by the Viceroy, "overruling a majority of his colleagues in Council." "The Viceroy stood," as Telang puts it, "in a glorious minority of two against a very large number against him." This was "one of the many indications of a new departure in Indian policy." "It was an indication of Government according to the whims and caprices of individual officers and that the Government by cabinets or councils was passing away". The condition was most unsatisfactory and mischievous. Besides as Telang points out in a meeting held to petition the House of Commons against the act, it was a breach of "promise

solemnly given to India indirectly through the replies to Manchester both by Lord Salisbury and Lord Lytton, that they would be no party to a repeal of these duties, if there was to be substituted for them some other mode of taxation". Such a taxation was imposed by the License Tax and the raising of the salt duty. A revenue that the state already possessed in the returns of cotton duties, was sacrificed to burden the famine stricken ryots at the most inopportune moment with enhanced salt duty and the odious because partial License Tax.

This closes the regime of Lord Lytton. The tide now turned. The Liberal ministry came in power in 1881 and sent Lord Ripon to fill the place of the Viceroy. He redeemed once more the glorious name of England as the mother of free institutions and the jealous guardian of the interests of the country committed to her care.

Lord Ripon's rule in India marked a transition from the old to the new. The form of Government was yet purely personal but a sincere attempt was made to make it more and more "broad-based upon the people's will". It was a conviction with Lord Ripon that England was to labour not for the material welfare of India alone, she must bend all her energies and her iron will, as he expressed it in one of his last speeches, to raise the people in the scale of nations by attending to their intellectual development, political training, and moral elevation. In all his measures, whether they dealt with education, local self government or the repeal of the Vernacular Press Act, it was in this spirit that "he endeavoured to discharge the arduous task which for four years was entrusted to his care."

In sketching the political career of Telang, if an Indian's share in the efforts to raise the political status of his own country be at all designated by that name, we are not concerned with all the administrative measures of that noble and beneficent rule. We turn at once to one measure which more than anything else marked the temper of the Government viz., its earnest and sincere desire to treat all people alike, to do away with privileges and exemptions as marking the government from the governed. We refer of course to the Ilbert Bill—a measure which roused the bitterest opposition on the part of the Anglo-Indian Community. The Ilbert Bill sought to do nothing more than introduce an amendment in the Criminal Procedure Code which empowered native magistrates to try European criminals. The opposition to the Ilbert Bill was headed by

members of the Civil Service and as Sir Henry Cotton has put it in his latest book, "the practical unanimity of opposition to that measure was as complete among civilian magistrates and Judges, as it was among planters, merchants and members of the legal profession". Lord Ripon was "harassed beyond measure by the bigotry and race feeling of his own countrymen". Mutual denunciation and recrimination were rife in Calcutta both in the Anglo-Indian and the Indian Community. The Viceroy was openly insulted at the gates of the Government House by the Europeans. The European community forgot that it was European. As Mr. Wacha has put it "it was scratched on its back and discovered to be primitive Tartar".

Every one seemed to have lost his head. "Matters reached such a pitch that a conspiracy was formed by a number of men in Calcutta who bound themselves in the event of Government adhering to the proposed legislation to overpower the sentries at Government House, put the Viceroy on board a steamer at Chandpal Ghat and deport him to England round the Cape".

"The dead wall of antagonism" by which Lord Ripon was confronted became for him too hard to overcome single handed. As a result a sort of compromise was effected, which was "the virtual though not avowed abandonment of the measure proposed by the Government". It was in Bombay alone that "there was discerned nothing, or next to nothing of that fury, abuse and wild fanaticism which disgraced Bengal". The Anglo-Indians and the Indians, though they differed from one another conducted the discussions in the papers with a dignity, moderation and sobriety, becoming true citizens. It was the Indian community that at this time evinced in their conduct a spirit of loyalty more loyal than that of the Anglo-Indians. They accorded Lord Ripon enthusiastic support in all his measures. A public meeting was held in Bombay to memorialize the House of Commons from the Indian point of view. Telang, Mehta and Badruddin Tyabji were the principal speakers.

Telang answered point by point all the objections raised by Sir Fitz James Stephen against the Bill. We have not the space to review his whole speech which is well worth reading; we only note a passage bearing on the broad issue of England's work in India. Sir Fitz James had written that the policy of Lord Ripon's Government was inconsistent with the foundations on which British power rests. Telang replied that he denied it entirely. He said,

that the principles of Lord Ripon's administration were in consonance with the long established principles of the British Government as laid down by Parliament and the Crown, and further that they were in accord with the lessons to be derived from the study of past history.

Then follows an eloquent passage which is worth quoting in full as giving us a complete insight into Telang's ideal of England's mission in India.

I remember being struck many years ago in reading, the history of the Romans under the Empire, with a passage in which the author said that one great lesson to be deduced from the history of Rome was that all conquering nations, in order to render their Government in the conquered countries stable and permanent, must direct themselves of their peculiar privileges by sharing them with the conquered peoples. Now, Gentlemen, we all know that it is the proud and just boast of Englishmen, that they are the Romans of the modern world and the British Empire is in modern days what the Roman Empire was in ancient times. If so, are we wrong, are we unreasonable in asking that the lessons of Roman history, and as Merivale points out, the lessons of the history of other ancient Governments also, should be adopted by our British rulers? "Is it not quite proper and reasonable for us to ask that the countrymen of Clarkson and Wilberforce, of Gladstone and John Bright, should not only adopt those lessons but improve upon them and rise superior to the countrymen of Marius and Sulla, the Triumvirs and the Caesars? I venture to say, gentlemen, that if Britons are now content to fail to carry out those lessons and to fall short of the generosity of the Romans, it will be regarded as not creditable to them by the future historian. And as a loyal subject of the British Government I should be sorry for such a result.

Every point that Sir Fitz James Stephen put forward against the Bill, Telang showed to be characterized by an attitude of shortsightedness and race-prejudice. Telang says "If I was an opponent of the Jurisdiction Bill, I should be afraid of his championship". When Sir Fitz James Stephen put forward a plea in favour of special privilege for Europeans on the ground that every section of the Indian Community enjoyed a similar privilege recognized by law, Telang answered that the privileges which the various Indian communities enjoyed were those of civil law. He asks,

what does it matter to John Jones whether the property of Rams, Ahmed or Mukerjee goes on his death to his sons, his daughters, his father, or mother or widow? But a law of Criminal procedure affects other communities in a most important respect.

Sir Fitz James Stephen had remarked in his reply to Mill that the British Government in India was heading a revolution. Telang fastens upon this statement and asks

if the Government is actually interfering with the personal liberties of us, unenlightened and uncivilised natives, is there any thing wrong in their interfering

with those of the enlightened Britons, with whose views and opinions, feelings and wishes they are much more familiar and in much great sympathy: Is there anything unfair if we ask that the same measure be dealt out to both?

Sir Fitz James Stephen's argument was that there were special tribunals for Europeans maintained in Turkey and other countries. Telang replies that

in foreign countries the European is protected from foreign courts to be subjected to British courts. In India he is protected from one class of British courts to be subjected to another; the difference is quite manifest between the two cases.

Another argument which Sir Fitz James Stephen brought forward was that it was only natural that everyone charged with a criminal offence should wish to be tried by one of his own race and colour. Telang replies "This leads to a difficulty that natives may have a similar wish". How does Sir Fitz James Stephen meet that? Why, he says that while no native understands English sufficiently to conduct a trial in that language properly, attempts are made, mark the expression, attempts are made to get European Officers to study the Vernaculars of the Country. Telang replied "For every European that can be shown competent to conduct a criminal trial in a vernacular language, we can show at least one hundred natives even more competent to do so in English".

Telang concludes a speech, which makes an intensely instructive reading in the art of dialectics and clear, sober and able presentation of one's own standpoint, by the remark which shows how strong was his faith in Great Britain.

We have a very good case; let us take it before the House of Commons. By past experience we know that in such matters we can trust to the justice and sense of fair play in the British House of Commons. Let us leave this matter also to their judgment in the full confidence that it will be there on consideration free from all local passion and local prepossession.

The House of Commons, as the events proved, could do nothing to support its own Viceroy against the clamour of the Anglo-Indian. Though the Bill was not avowedly withdrawn, its shrinkage in the Legislative Council was tantamount to a virtual abandonment of the principle it was sought to enforce. The wisdom, sobriety and right direction of which Telang spoke in almost his last public address were the remarkable features of the agitation over the Ilbert Bill, in Bombay piloted by leaders like Telang, Mehta and Tyabji deservedly known as the triumvirate of Bombay's political life. Their attitude secured the compliment of Lord Cromer who characterized

the public opinion of Bombay "as expressive of the best type of political thought in India". "This appreciative sentiment," as Mr. Wacha has told us, "had reference to the sobriety and ability with which the great historical meeting in Bombay in support of the Ilbert Bill was conducted".

The next memorable speech of Telang was in connection with this public meeting held to commemorate the Viceroyalty of Lord Ripon. In that speech he gave reasons for his participation in the movement. Telang in that speech takes up every measure of Lord Ripon and shows how in all his doings the ryot was the object of his "moving active sympathy". His policy deserved praise because "it was diametrically opposed to the policy of carrying taxation along the line of least resistance which commended itself once to some great masters of statecraft". There is an underlying irony in this remark, because the great master of statecraft Telang refers to is evidently Lord Ripon's predecessor under whose administration the finances of India were in a state of hopeless muddle. Telang sums up the spirit of Lord Ripon's rule thus —

Whether we look at the repeal of the Vernacular Press Act or the resolution for making public the aims and scope of Government measures, or the practice of inviting people's opinions on contemplated projects or whether we look to the great scheme of local self-government, or the manner in which Kristofas Pal was appointed to the supreme Legislative Council, we see clearly the liberal policy of Lord Ripon's Government.

Adapting the lines of Tennyson, Telang concludes the speech thus

Lord Ripon has made the bonds of freedom wider by shaping diverse august degrees, which have not only left Queen Victoria's throne unshaken in this land but have made it even more broad based upon the people's will. It is that on which, in my humble judgment, rests most firmly Lord Ripon's claim to our gratitude. It is that which justifies the remark that summing up the result of Lord Ripon's rule, you may say, borrowing again the *Language of the laureate (Tennyson)* that "he wrought his people lasting good".

The Indian Community discovered its own strength of combination, its capacity to co-operate in spite of differences of creed and custom on two occasions in the reign of Lord Ripon. First in supporting the Government in its introduction of the Ilbert Bill and secondly in connection with the hearty send-off it accorded to Lord Ripon. For the first time in its long history India forgot that it was a congeries of different nationalities.

The Indian heart bent to one common impulse, it recoiled to one common sentiment. Her

Majesty's permanent opposition, the sobriquet given to the microscopic minority of the educated classes "walked" to use the phrase Telang used, "for once into the ranks of the ministerialists." The lesson of common agitation thus learnt was well laid to heart. Out of the impulse thus given sprang a movement, which was to bind the sympathies of all, and bring about a coalition and union for common ends. The birth of that movement was the indirect fulfilment of the policy of Lord Ripon. In reviewing Telang's work as a politician, it is this movement, the growth of which from a seedling into a strong and firmrooted plant, he watched and fostered for well nigh a period of 8 years, that will occupy our attention now. He was the moving spirit of the Congress from its very inception. From 1885-1889 he worked as its general secretary.

His interest in the two organizations in the initiation of which he had a great share, viz., the Bombay Presidency Association and the Congress, continued unabated to the end of his life.

Before however we turn to Telang's work in connection with the Congress, we have to dwell for a while on his work as a secretary of the Bombay Association, the Bombay Branch of the East India Association started by Dadabhoi Nowroji and of the Bombay Presidency Association started by Telang, Mehta and Tyabji in 1885. It was his work as a secretary of these Associations that gave him the training which made him such an effective force in politics. It was as early as 1873, a year after he had entered the profession, that he became the secretary of the Bombay Association started by Bhaui Daj and others in 1848 at the instance of Dr. Buist the veteran journalist of the time. Later in 1868 was started the Bombay Branch of the East India Association by Dadabhoi Nowroji. In, 1860, the Bombay Association had collapsed and the Bombay Branch of the East India Association was about to share the same fate. Dadabhoi revived it once more by introducing new blood. The Bombay Branch of the East India Association was found after the events of 1883 and 1884 inadequate for "the extended sphere of political activity which was recognized as essential in view of the greater needs of the country." A new political organization was therefore started in 1885 which has been doing its useful work for the last 26 years. With all these three Associations Telang was vitally connected as their *working secretary*. It was in this capacity that he received his first lessons of wise agitation.

It was Telang's long experience of the practical part of political work as a Secretary that kept his utterances free from "the foppery of high flown sentiment", and endowed him with a practical turn of mind, sobriety of judgment and close powers of reasoning.

From Telang's work as the secretary of the Bombay Presidency Association we pass on to his work as a member of the Bombay Legislative Council of which he was a member for 5 years. He was nominated in 1884 by the Government of Sir James Fergusson and the appointment continued on, by further nomination through the reign of Lord Reay till 1889. In his capacity as a member of the Council he proved himself an "effective and active critic" of Government measures. Perhaps the most important bills introduced during his term of appointment were the Bill for the Amendment of the Land Revenue Code of 1885 and the City of Bombay Municipal Bill introduced in 1887. His general attitude towards these measures may be best summed up in the words of Sir Raymond West.

On all occasions he resisted excessive Government action and interference with the fair play of individual will under the traditional conditions, but always with an elevation of view and a sense of responsibility which made his very opposition an ultimate source of strength.

In his advocacy of people's grievances he was neither fussy nor meddlesome, but when he thought that a principle was at stake he was the foremost to assert it and he asserted it in no hesitating tone.

We now turn to the last phase of Telang's political activity, namely, his work in the Congress. This is not the place to trace the genesis of the Congress. Suffice it to say that to Mr. A. O. Hume goes all the credit for the starting of a movement that was to grow in course of time into such a mighty and potent instrument of national awakening. The Congress held its 1st Session in Bombay in 1885. For four years till 1889 Telang took a most prominent part in its deliberations.

Evidently Telang was not afraid of making the administration of India a party question. Knowing as we do his leanings and relying as he did upon past experience it is not difficult for us to see with what party he would have been willing to throw in his lot. It was to the countrymen of Gladstone, Bright, Clarkson and Wilberforce, that he appealed in one of his speeches. It was the Government of Lord Ripon that had stood up in his eyes for principles of the Proclamation. Naturally enough therefore the party that gave

such a Government was the party towards which his sympathies would incline and to which he would look up for a progressive measure of Constitutional Government.

For two years Telang could not attend the sittings of the Congress held at Calcutta and Madras. In 1888 he attended the Congress at Allahabad presided over by George Yule and spoke on the resolution of the Reform of the Councils, upholding the same scheme that he had developed in 1885 and dealing with the comments made against the Congress propaganda by highly placed Anglo-Indian officials and more especially by the Viceroy himself in his post-prandial utterance at the annual St. Andrew's Dinner held in Calcutta. Lord Dufferin's attitude towards the Congress was in the main of cordial sympathy. It was owing to his suggestion that the Congress developed into a political gathering. When Mr. Hume in an interview at Simla had before the Viceroy his project of arranging for an annual meeting place where leaders of Indian thought could come together and discuss social matters, Lord Dufferin told Mr. Hume that it would be far better if the leaders met and pointed out to the Government "in what respects the administration was defective and how it could be improved." Lord Dufferin said that there was no body of persons in India who performed the functions which Her Majesty's Opposition did in England.

The newspapers, even if they really represented the views of the people, were not reliable and the English were necessarily ignorant of what was thought of them and their policy in the native circles.

He therefore proposed that

the Indian politicians should meet yearly and point out to the Government in what respects the administration of the country needed reform to bring it in a line with the wishes of the people.

When Mr. Hume laid this scheme before the leaders of different provinces it met with the approval and support of all. When the Congress met in Calcutta in 1886 Lord Dufferin invited the leading politicians to a garden party. Thus Lord Dufferin's attitude towards the Congress was in the main sympathetic. Consequently when Telang answered the comments of Lord Dufferin, it was to show that Lord Dufferin had clearly misapprehended the attitude of the Congress. The speech which he delivered on this occasion bound fresh laurels to the brow of Mr. Telang. Mr. Wacha says "To my ears it rings as if it had been delivered yesterday, full as it was of that close reasoning, persuasive eloquence and convincing logic of which he was master." Mr.

John Adam who attended the Congress at Allahabad characterizes it thus:—

No one who was present at Allahabad when all India was reeling with the exuberant verbosity of the St. Andrew's Dinner Speech can forget how the passage in which Telang compared the remarks of Lord Dufferin on the Congress proposals to somebody's definition of a crab brought down the house, and the (pawky?) way in which the speaker's eye suggested that the fable of the crab might be given a slightly different application.

If in his speeches on the cotton duties and the License Tax, Telang had set himself "to denounce the Jingoism of Lord Lytton" and in his speech on the Ilbert Bill and on the retirement of Lord Ripon he had "applauded the liberalism of that generous hearted Viceroy," in the speech delivered before the Congress at Allahabad, Telang in the opinion of John Adam, made it equally clear that he would have none of the diplomacy, the tortuous *haute politique* which Lord Dufferin for its sins imposed on India. The passage containing the reference to the fable of the crab is worth quoting and runs as follows.—

His Lordship says, the idea authoritatively suggested as I understand, is the creation of a representative body or bodies in which the official element shall be a minority, who shall have what is called the power of the purse and who through this instrumentality, shall be able to bring the British executive into subjection to their will. The basis for that statement is our demand that the financial statement shall be brought before the Council for discussion. Not only do I not find in any of the reports any grounds for such a statement but I find what is actually the reverse of it. It has been said over and over again that the executive shall have the power of deciding what shall be done and of absolutely vetoing any proposal emanating from the rest of the Council and yet in face of such a resolution as this, which we have passed not once, not twice but three times, such a statement has been made by his Lordship. I can only express my amazement at it and I cannot believe his Lordship capable of making it except on the assumption that he has lacked the time to study our reports himself.

Following on this comes the passage which Mr. Adam praises so much

The various charges which his Lordship makes against the Congress, are charges which remind me of a certain definition which was once given of crabs, viz. that a crab is a red fish which walks backwards, and the criticism made upon that was that the definition was perfectly correct except that the crab was not a fish, that it was not red and that it did not walk backwards. Now I may say that Lord Dufferin's criticism is perfectly correct, except that we have not asked for democratic methods of government, we have not asked for Parliamentary institutions which England has got after many centuries of discipline: we have not asked for the power of the purse; and we have not asked that the British Executive should be brought under subjection to us.

This speech is throughout characterized by "sustained simplicity and cogency of rhetoric"

which was the conspicuous feature of Telang's public speaking. There is a flavour of refinement and high intellectuality about his utterances rare among the champions of people's rights. This speech as well as those on the Ilbert Bill and the Cotton Duties deserve careful perusal both on the score of their manner and matter. In all these he comes out as "practical, fertile, sagacious, and moderate."

They are considered by Sir Raymond West as models of criticism "which those who would fain take his place and continue his work would do well to study and imitate." These gained for him the reputation of a leader "who led his countrymen by rising superior to them in toleration, largeness of view and in the charity which shrinks from imputing evil."

The Congress of 1888 was the last Congress Telang attended. Before its next meeting in Bombay in 1889 he had been elevated to the Bench and could no longer be an active worker in the political field. In the Age of Consent Controversy Telang again came to the forefront to define what he thought the limits of state action. There again he shone out as the bold champion of what he considered to be the right and true course of action. Then it was that he proclaimed that a man may renounce his right but can never renounce his duty. What is true of a single individual, is more true of the state.

KASHINATH TRIMBAK TELANG

THE MAN AND HIS TIMES.

BY MR. VASANT. N. NAIK, M.A.

PREFACE.

The years between the seventies and nineties of the last century, however tame they may appear to us now have a deeper significance for us as being the epoch of pioneer work. These were the years when the foundation was laid of many an activity, the ripening of which is yet to come. In all these activities Telang played a very conspicuous part. The knowledge of his life, his ideals, his methods of work and his aspirations will not come amiss, nay is bound to be immeasurably useful in an age when passion is apt to run riot and "enthusiasm is made to do duty for reasoned scrutiny."

The sketch can lay no pretensions to the name of a biography. It is but an humble essay on the part of the writer to understand the man and his times and to draw for himself a picture of the man as accurate and faithful as possible from the very scanty materials at his disposal.

HOW TO BECOME A JOURNALIST.*

BY MR. J. FOSTER FRASER.

HE journalistic profession has almost as much fascination for young men as has the stage for young women. There are few youths who at some time or other are not afflicted with a desire to write for the Press. Writing is so easy; well known journalists can make any thing from one to two thousand pounds a year; there is always journeying about the country or about the world, with a front seat to witness the best that is going on, and nothing for the journalist to pay. It is a pretty picture.

As a matter of fact the trade of newspaper writer, whilst interesting is arduous. There are fine prizes to be obtained; but the journalist who has the ability to secure one of them would, with equal ability, make from five to ten times the money in any other profession. Yet, as one who is somewhat of an old stager, I can say now after nearly thirty years' writing for the Press, that there is no work I would exchange for that of a journalist. I suppose that, without any pretence to mock modesty, I am one of the successful journalists; but remember, it took me twenty-five years to get where I am.

The journalist usually drifts into newspaper writing from some other occupation. This means he has a leaning towards writing, and as an amateur and semi-amateur, has been able to win his spurs. This is a better plan than a young fellow going straight from school or college into a newspaper office, for the latter may only have the liking without possessing the ability. It is a striking fact that University men, with all their special advantages, rarely prove good journalists. The best man is he who has had to do some battling with life and affairs, who has acquired a

knowledge of men, possesses a seeing eye, and has the faculty of describing what he sees in clear plain language.

The young fellow who wants to become a journalist may, of course, be a *genius*, and, within a year or two, be able to fly to the topmost branches. For there is no hiding of one's light under a bushel; a Pressman soon shows the stuff of which he is made. Other papers will be quick to appreciate him, even if he is not appreciated in the office where he first tries his wings.

Now a knowledge of shorthand is useful, though I for one have never been enthusiastic over stenography. I went through the mill as a reporter, and at one time could take a verbatim note as well as my neighbour. But since I have become what is called a descriptive writer I have more and more dropped shorthand, until I am anything but proficient. Acquaintance with shorthand, however, is advisable because it is difficult to make a start in the lower branches of the profession, such as reporting town councils, inquests, police courts, and prize distributions, without it. The more skilful reporter is he who can listen to a speech of an hour's duration and write an accurate summary of it within the space of half a column. If a man with ambition desires to put himself to the test, let him read a four column speech delivered by a political leader, and then sit down and reduce it to one-eighth, and not miss a single point of importance. The journalist who can summarize is, in these days of newspaper compression, more valuable than the man who can take a verbatim shorthand note.

It is, of course, advantageous for an aspirant to be more or less familiar with the politics of the world, and particularly with those of his own country. A daily acquaintance with our leading newspapers of various types is essential. I do not advocate, however, a too close reading of newspapers; indeed, a legitimate criticism to be passed upon many journalists is that they confine their

reading too much to newspapers and acquire a style without distinction. The reading of books, novels, what you like, but well written and with distinctness of diction, is valuable. There should be no imitation. There should be no attempt at flowery writing. The journalist should endeavour to be natural, to tell his story so that it is easily read and quickly understood. With his personality, and out of his reading, he will unconsciously develop a style of his own.

All this can be practised by the amateur. The man in the street with the journalistic instinct is constantly seeing things which newspapers are glad to publish. A new and original point of view invariably finds favour. The man who says "Oh, but I never see things suitable for the Press," is simply admitting that he is not a real journalist. Everything has been written about before; but the successful writer is he who can see things with a fresh eye and write about them in an attractive manner. I remember Mark Twain once saying to me, "Everything depends on the point of view. Get an original point of view, keep that in mind, and then you can write an interesting article about door handles."

The man who feels that he has the making of a great journalist in him naturally casts his eyes to the staffs of one of the great daily papers. My firm opinion is that nothing is worse than starting one's journalistic career on a big daily newspaper. It may be all right, but as a rule it is not on such journals that the best newspaper correspondents are trained. There is nothing like the all round experience to be obtained on a weekly provincial paper. The reporter on such a journal is often a maid-of-all work. He writes notes on local affairs, he describes flower shows; he reports the sayings of local magnates; he makes the correspondence of country contributors intelligible; he reads proofs, and, indeed, picks up a variety of knowledge which will stand him in excellent stead all his life, no matter to what post he may attain.

It is a good thing for a journalist to specialize on one subject. Whatever this may be it will be decided by natural inclination, and therefore likely to be done well. As a journalist progresses in his profession, and he reaches the staff of an important paper, he will find that the tendency for him to specialize on particular lines. Whether it be about the Navy, or Army, or Labour questions, or foreign affairs, it is always a "pull" for a man to know more about a certain subject than anyone else in the office.

The one thing to be avoided is dulness. The new comer who has the opportunity of witnessing important events will do well to study how well known descriptive writers deal with them. One of the principal arts is to know what to leave out. To crowd a descriptive article, say, about a naval review, with details, produces only a blur upon the mind of the reader. The good writer notes the essentials in the picture, and then, with it visualized before his mind, he can describe it in such a way that the reader is conscious of also beholding the scene. To be able to do that is first class journalism.

When I say that dulness is to be avoided I indicate at the same time that it is a duty to be interesting. There are some journalists who are able to write a bright and entertaining column about a debate on Scotch estimates in the House of Commons, when other men have been conscious of nothing but long drawn dreariness.

Some old fashioned folks object to the personal touch in modern journalism. Personally I believe in the personal touch. The reason private letters describing an adventure are frequently so much more interesting than descriptions which appear in newspapers, is generally due to the personal note. The success of what is known as the *Parliamentary Sketch*, and which is generally read whilst the ordinary report is neglected, is because the reader likes to know how a man spoke, how he looked while speaking.

what were his little mannerisms, how did the House listen, and how did he behave under interruptions. This kind of writing provides a better conception of the effect of a speech than many columns of verbatim report.

Undoubtedly the qualities required to succeed as a journalist are many. There must be knowledge of human nature, a quickness to appreciate the dramatic points of the situation, and ability to tell in good terse English what has been happening. It is one of the best professions in the world for a man to "find himself." If success does not come his way, it is because he has not in him the ingredients which make particular success. Every man gets his chance. As usual, round the lower rungs of the ladder, there is some jostling; but higher up there is plenty of room, plenty of opportunity, and though the work is hard the remuneration now is better than ever it was.

What is it that brings particular men to the top of the journalistic wave? It is not necessary to mention names, but it would be easy to recall men of no particular culture, who make no pretence to be widely read, and who have, in newspaper parlance, "got their public." The secret, if secret there be, is individuality. Now you cannot turn out journalists ready made like a pair of trousers. There are journalists who are fools and others who are brilliant. Strength of character will develop individuality. I advise every young writer who has managed to save between £100 and £200 to be bold. Let him pull up stakes, do not bother about promotion, and go off for a year of wandering. Let him roam about Europe learning things—not wanting to write about everything he sees but meeting all sorts of folk, roughing it, keeping a merry heart, and doing plenty of reading. This is the best school of experience, and if the pen is laid aside for a time, it is surprising the grip and power in writing which will be shown when he takes it up again.

Or let him go over to the United States and take pot luck as a free lance journalist. It is a tough life, but it smartens a man up. If I could afford it, I would send every young British journalist over to America to learn what enterprise and hustle is, and I would bring every young American journalist over to this country, in the hope he would get a glimmer of what accuracy and restraint of language mean.

THE CURRENCY DILEMMA.

BY

S. K. SARMA, B. A.

WHETHER one does or does not agree with the views of the Hon'ble M. de P. Webb on Indian currency, there is no doubt about the energy and persistence with which he presses them on the attention of the Government and the public. The problem of Indian currency is undoubtedly the most difficult and complicated of all problems, but it has been systematically ignored both in and outside the Legislative Council. During the last few years, only one debate took place in the Imperial Council and even on that occasion only three Indian speakers took part in it, besides the mover of the resolution. The debate on the whole was perfunctory as was the reply of the Government. In the Press, the criticisms have been even more scant and those who have discussed the question have taken up more or less an one-sided attitude. M. Webb's agitation is therefore doubly welcome both by those who agree with him and those who differ from him.

In his *Britain's Dilemma* * M. Webb re-states his conclusions with old arguments, but it is not apparent why he calls the dilemma as entirely Britain's. It would have been more true to say that it is exclusively Indian. M. Webb's argu-

* *Britain's Dilemma*. By M. de P. Webb. G. A. Natesan and Co, Ra. 5-14-0.

ment seems to be this. The yearly output of gold from the mines of the world has now reached such a fabulous figure that the value or purchasing power of the metal is steadily diminishing. Prices are everywhere rising and those who have fixed incomes and whose resources are slender are placed in a position of increasing difficulty. The loss due to the recent coal strike in England is estimated to be ten millions and yet there must be many more strikes in England unless the present extraordinary production of gold can in any way be checked or its effects neutralised. If India could be encouraged to consume the yellow metal, it would steady European prices. But if she did so, the City of London raises a hue and cry. Discount rates rise to protect and maintain the modest reserve of the yellow metal, which means loss and inconvenience to the merchants and financiers of England. Thus Great Britain is on the horns of a dilemma. Shall she encourage the consumption of the yellow metal by India, which would prevent high prices and strikes or shall she discourage it which would help the City?

M. Webb apparently believes, like myself, in the quantitative theory of money. Other things remaining the same, an increase in the volume of currency will cause an increase of prices. But have other things remained the same? Is the inflation of gold prices due exclusively to an increase in the volume of the production of gold and have no other causes been at operation to affect prices? Here is a table of the production of gold during the last half a century.

GOLD PRODUCTION OF THE WORLD.

	£		£
1860 ..	28,000,000	1890 ..	25,000,000
1865 ..	25,000,000	1895 ..	41,000,000
1870 ..	27,000,000	1900 ..	52,000,000
1875 ..	20,000,000	1905 ..	78,000,000
1880 ..	22,000,000	1910 ..	96,000,000
1885 ..	23,000,000	1911 ..	97,000,000

It will be apparent from the table that the production of gold was steady between 1860 and 1890, for a period of thirty years, the production averaging about 25 millions, which doubled in 1900 or in the course of a decade, which again doubled last year, in the course of another decade. What about prices?

Here is a table which shows how the wholesale prices of various important commodities have varied in the last 40 years.

Prices 1871—1911.

	1871,	1880,	1895,	1900,	1911.
Coal	58	53	56	100	68
Pig Iron	72	76	57	100	75
Tin	96	67	48	100	145
Cotton	135	113	74	100	138

ing the above named 136 130 91 100 109
Production of Gold in

Millions of £ . 27 22 41 52 97

Even a superficial study of these figures discloses the fact that the price level has not corresponded with the production of gold. It is not stated that the production of gold has had no effect whatever on prices, but what may safely be stated is that other causes have been at work which neutralise the effect of that one factor. Gold prices have fallen while the production of

gold has remained steady and the proportion of their increase has been smaller compared with the production of gold, when its output began to expand. With a hundred million standard of gold output, gold prices have not reached the level of forty years ago. Nor have all articles responded to the increased production of gold even in recent years. In the first place, there has been the demonetisation of silver in Europe. Simultaneously with it, as Mr. Chiozza Money has well pointed out, in the early period of falling prices the virgin resources of the world in fertility, in forests and in mines, proceeded so rapidly that although the world-demand also increased, it did not increase rapidly enough to keep pace with the opening up of new countries. Therefore prices fell. The process could not proceed very far without bringing the world to a point where this creaming of world's most plentiful materials slackened, not actually, but relatively to the world's demand. How unnecessary, as Mr. Money says, to attribute the rise in tin to over-production of gold when we know quite well that it has risen because the best tin of the Malayan mines has been used up, or how idle to talk of gold as a main factor in connection with cotton prices when we know that cotton ran short because here there was only one big supplier in the world and that supplier was not big enough to meet the world-demand. In the case of petroleum there has been no shortage and there has been no increment of price.

If so, M. Webb's argument loses all force. On the other hand M. Webb does not require for his purposes the line of attack which he has chosen, to condemn the currency policy of the Government of India. His thesis is that the time has come for India to adopt a gold standard based upon a gold currency. It is on his part a tactical mistake to urge the adoption of the gold currency in India on the ground that it would release Europe of a considerable mass of gold which at present inflates

prices; for the connection between the increased output of gold and the rise of prices is not established with certainty, the probabilities going to establish rather that the shrinkage of world's production relating to the demand, is responsible for inflated prices in certain commodities. Even if the production of gold has been responsible for the inflation of prices, its effect cannot be too perceptible, at least for some more years, when regard is had to the fact that the estimated stock of gold in the principal countries is 3,500 millions sterling, the annual addition to which being only 98 millions, while the work that the volume of currency has to do today must have multiplied many times over what the volume of currency of thirty or forty years ago had to do.

The chief charges that M. Webb specifically makes against the Government may be stated thus: (1) the transfer of about 8 millions of the Indian Paper Currency Reserve from India to London; (2) the transfer of about 17 millions of the Indian Gold Standard Reserve from India to London in face of the protests by both the Press in this country and the Chambers of Commerce; and (3) the removal to England of about 10 millions of the floating cash balances of India to be lodged in the Home Treasury at the Bank of England and subsequently lent out—millions at a time—with and without security, to certain Joint Stock Banks and other "approved borrowers" at rates of interest far below what could be obtained in India itself. The question was definitely raised by Mr. Thackersay in the Imperial Legislative Council in March last and the charges against the Government and their reply are worth investigating.

So far as the Gold Standard Reserve is concerned, its object was to accumulate a reserve of gold so that it may be availed of when exchange fell below 164. It was intended to maintain the exchange and keep it steady. At the time of its constitution the Government of

India did not want it to be kept out of India. "The public," wrote Sir James Westland, "will regard with distrust arrangements for the establishment of a gold standard in India which carefully involve the location of the gold reserve in London and its use therefore by trade. A gold reserve intended to support the introduction and maintenance of a gold standard in any country ought to be kept in the country if it is to produce its full effect in the way of establishing the confidence which is almost indispensable to the success of the measure. If the Indian gold reserve is located in London and the public believe that it may at any time vanish in supplying the requirements of trade or of the Secretary of State, confidence will hardly be established, and in any case it seems certain that a reserve of any named amount will produce a greater effect if it is located in India than if it is 6000 miles away." But the Government of India at present are entirely of a different opinion.

It is not necessary to repeat here the reasons why the Gold Standard Reserve should be kept in India; Sir James Westland has stated them and they have been enlarged by Mr. Thackersey in the Imperial Council. But I cannot help saying that so far as the Gold Standard Reserve is concerned, the view of the Government of India is more acceptable than that of their critics. I am not arguing the point that if a gold currency is to be introduced it would be absurd to keep our gold in England. I am convinced they are not going to try it and they will fail ignominiously if they do. The purpose of the Reserve is not to introduce a gold currency, but it is only to steady exchange and if so, that purpose is better served by keeping our gold in England than in India. If kept in India, it will of course help trade here, Indian and Anglo Indian, as it is helping trade in England now. Doubt may naturally and legitimately be raised if the Secretary of State will be

able to release gold when required to do so. The Secretary of State believes he can and the Finance Member said, "I can only repeat what I have said before in another connection, that the Secretary of State has deliberately accepted full responsibility for making the reserve available when required for the purpose for which it was created." I wonder if Sir Fleetwood Wilson shares in the confidence of the Secretary of State. If the Secretary of State held it in solid gold that would be a different matter, and so long as he has lent it, the very difficulties that may call for the conversion of the securities may make them unsaleable or saleable at ruinous loss to us. So far as the locality of the Reserve is concerned, it would therefore seem it is better kept in England than in India, that is to say, if gold is not to be our currency.

No such defence however can be made as regards the Paper Currency Reserve or the cash balances. The cash balances run up to seventeen millions, while only four years ago the normal balance maintained was four millions. Why this enormous withdrawal of India's money to England and why are they lent out to British traders? When the question was directly put to the Finance Member in March last, he attempted one of the most strange and feeble replies ever given by a responsible official. He said: "High balances in ordinary circumstances are an indication that we have borrowed more than is actually necessary. But it would require a somewhat detailed analysis to place the Council in a position to judge whether the recent history of our Treasury balance justifies this condemnation. I should have to point out to what extent money has been accumulated in London to meet large payments for the redemption of railway debenture which are shortly due. I should have to connect our opium windfall with the India Bills which, I hope, we are now on the eve of withdrawing and I should, no doubt, have

to add a number of other qualifications before I could answer with confidence the point which my Hon'ble friend has taken." And none of these he did. Two reasons he hinted at for this strange action, payments for the redemption of railway debenture in 1912 and opium windfall. But why was the cash balance increased to £ 7,983,898 in 1908 from £ 4,607,266 in 1907, to £ 12,799,090 in 1909, £ 16,697,245 in 1910, £ 15,292,638 in 1911 and £ 17,953,995 in March 8, 1912? Not prudence, we suppose!

That these surus are being withdrawn not with the view of meeting financial obligations in England, but because the Secretary of State for India is playing into the hands of a powerful body of greedy financiers in England, gains point from the fact that even with these heavy sums on hand he has declined to make use of them when the necessity for it was obvious felt. Replying to a question of the hon'ble Mr Armstrong about the floating debt issued and repaid during the financial year ending March last, the Finance Member said: "No new floating debt was issued during the current year, although £ 4,500,000 of bills were renewed, the amount repaid was half-a-million, the average rate of interest on the India bills renewed during the current year was 2.97 per cent." With several millions on hand, why should the Secretary of State renew bills at 2.97 per cent, while he lends at 2.50 per cent? More mischievous and disastrous was the recent attempt to raise a loan of three millions. Surely it seems madness to lend to the City over fifteen millions at $2\frac{1}{2}$ percent and go in for a loan of three millions which is quoted at 87. It speaks volumes to the selfishness of the City, but it reflects no small discredit upon the financial acumen of the India Office that they should lend freely on the one hand and struggle hard for a small loan on the other. When in ordinary circumstances it is not possible to raise a three million loan, for which the Secretary of State had

in his own hands ample funds, how can he hope to realise the securities at their face value, when the exchange falls?

Inexplicable though the action of the Secretary of State is in misapplying public funds—we cannot call it in a less strong language—the question may be raised whether it is not the inevitable result of the ill-advised agitation of the Anglo-Indian merchants to close the mints, for the private coinage of silver and adopt a goldless gold standard. There are some critics who still believe in the "Exchange Standard" or the goldless gold standard. Reviewing my book, *Indian Monetary Problems*, a writer in the *Manchester Guardian* wrote: "Certainly the gold exchange system has succeeded beyond the expectations of its supporters; and if success follows success in India and other places where it is being given a trial, it may culminate eventually in the realisation of Professor Irving Fisher's dream of a money which is approximately stable in purchasing power and may be depended upon to remain so—who shall say as yet; Mr. Sarma wants primarily the 'honest rupee,' as the demand is popularly put in a question-begging way. Is Mr. Sarma quite sure in his own mind, after studying the matter as he has done, that he is not unwittingly playing the part of Dean Swift with Wood's halfpence and under the like inducements?" Really! We in India know how the success of the scheme is all a myth and that it is the source of endless troubles. A committee has been sitting to enquire whether the Exchange Standard is not after all the cause of high prices in India.

Let me sum up briefly the consequences of the fatal step taken in 1893. They managed till 1901 without putting the mint to work, but suddenly in that year they were compelled to coin rupees. In 1899 sovereigns and half sovereigns were made legal tender and the Government were felt compelled to give rupees in exchange. The operation was carried on through the Paper Currency

Reserve. In 1900 the gold held in the Paper Currency Reserve was 11 25 crores, in 1902 it was 10 54 crores, in 1903 it was 14 79 crores, in 1904 it was 16 18 crores and in 1905, 16 11 crores. In the following year it was resolved to establish a branch in England and 6 millions were withdrawn. Gold is received both in England and India and notes are issued against the same, but the notes are redeemable by rupees alone. At the present moment over 60 crores of currency notes are in circulation and surely the Paper Currency Reserve must have enough silver to pay for the notes when demanded. Already the silver in the Reserve in India has touched the danger point and the belief is generally entertained that the Government will have to coin rupees shortly. If the notes are redeemable by gold, we will have, of course, an effective gold currency. But the Government dare not do so. They cannot undertake the responsibility of finding gold for all the notes in circulation, and when the notes are paid for in gold, they must be equally prepared to pay gold for rupees. That is an obligation they dare not enter

The real dilemma is therefore this. The Government is forcing up note circulation and they dare not say no when gold is tendered before them. The notes are redeemable only in silver. The silver currency must therefore increase. It is immaterial whether it is silver notes or silver rupees that are forced up into circulation. It is undoubted the currency is being allowed to swell. They might have gone in for an automatic gold currency, but they dare not, for they might have suddenly to face a demand for gold which they are not prepared to meet. The consequence is our currency is allowed to be diluted. And may I venture a suggestion, that not only the Government is afraid of a gold currency as they cannot meet the demand, but they have their doubts if the Exchange Standard can stand? May it not be that the accumulation of gold in England is

born of the fear that exchange may fall at any time and that instead of twenty or twenty-five millions they really want forty or fifty millions in England to maintain the bogus rupee at 16 d?

That would seem to be really at the bottom of the whole thing. M. Webb maintains in his book that the country is fit for a gold currency, but he has nowhere attempted to show what the cost of it will be and what the amount of gold the Government will have to keep on hand before introducing the gold currency. That issue is shirked. He waxes eloquent about the gold that is imported every year and condemns strongly the prevention of further importation by the Secretary of State selling Council Bills in excess of his demands. The Secretary of State need not do so if the people would circulate sovereigns and half sovereigns as the trade would bring gold in and put it into circulation. The fact that trade does not bring in gold is proof positive that there is no effective demand for sovereigns. M. Webb says that "it could hardly be expected that foreign gold coins with which the bulk of the population in India were quite unfamiliar would instantly spring into popularity." Does he mean that Swadeshi gold coins would be preferred to British sovereigns? There is no evidence that there will be an effective demand for gold for currency purposes, however much we may consume the yellow metal for other purposes and the Government apparently believe that the Exchange Standard is the best, at all events under present conditions, and their efforts are directed towards maintaining the exchange steady, by increasing the gold reserve in England. That it can only be done by diluting the silver currency here and that every attempt to increase the gold reserve by adding to the rupee currency can only expose the Exchange Standard to even greater risks and dangers, the Government cannot be convinced, till some financial cataclysm overwhelms them and upsets all their fine conclusions.

FIRST TRADING RIGHTS OF THE EAST INDIA COMPANY.

BY THE REV. ARTHUR R. SLATER.

It is three hundred years since that intrepid sailor, Captain Best, landed in India and began that strenuous contest with the Portuguese power which was to deprive them of their supremacy in Indian waters and to establish the English as traders on the mainland of India. The little fleet which, after a journey of eight months, reached the small town of Surat, in September 1612, was the instrument by which the first steps were made possible toward a regularly recognised system of trade between the people of India and England, and it may not be without interest to recall to mind the events which led up to this new venture of the East India Company, the later activities of which were fraught with so great changes to this country. Before describing the great struggle which took place at Swally it will be necessary to briefly look at the relations which previously existed between the English and Portuguese traders in Eastern waters. There were difficulties with the Dutch as well, but the real opponents of those other European nations which desired to obtain a footing in India for the purposes of trade were the Portuguese, and against these for many years the diplomatic efforts of the English were to prove fruitless. But 1612 was to prove fatal to all Portuguese monopolies and to entirely change the opinion of the Muhammadan rulers with respect to the fighting qualities of the British, and the foundation of the British Empire in India must be directly traced to that first firm granted by the Emperor after Best's notable victory.

The Portuguese had been in the country for over a century and in that time they appear to have gained a very strong hold in certain parts where their sovereignty was recognised by the

ruling Indian princes. Trade was the chief object of their visits to India but they also had visions of conquest, and one of the greatest difficulties the English East India Company had when it came to try to found factories and establish trading rights, was the claim of the Portuguese that the princes of the Indian coast and the Spice Archipelago were, under the treaties which the Portuguese had insisted on, subjects to the Portuguese Crown, and therefore their dominions were a part of the Portuguese kingdom. It was early reckoned that if they wished to retain their supremacy against other traders it would be necessary to have a strong sea fleet, and with this object in view all seaports on the Western side were prohibited from making vessels. It is certain that this attention to its fleet gave the Portuguese the supremacy in the Asiatic trade for many years until the Indian people had begun to look upon the Portuguese as invincible on the water. "Their fleet enabled them to choose any point along the 15,000 miles for attack, and to concentrate on it their whole force. They could deliver their blow at their own time; if successful they left a garrison; if unsuccessful they disappeared below the horizon; having struck terror, or sometimes compelled submission, by the atrocities inflicted for resistance. The whole coast of Asia from the Red Sea to the Eastern Archipelago was thus menaced by an invisible foe from the ocean, whose movements defied calculation, whose attack was often irresistible, and whose vengeance always cruel." The Portuguese were determined that no such fleets as they possessed should grow up in India and they were equally prepared to question the right of European countries trespassing on land they had claimed as their own. Having secured this supremacy by means of a strong fleet, treaties with native rulers, often obtained by taking part in their quarrels and intrigues, they now determined to gain a monopoly over certain

goods, an object in which they were partially successful. There is scarcely one who would uphold the methods employed by the Portuguese in their attempts to exploit this country, and it can but be looked upon as a good fortune that their power was broken ere they were able to obtain a firm hold on the land. These then were the people who held the monopoly of commerce and were determined at all costs to keep out other nations.

Inspired by commerce other nations turned their eyes towards this land, but this brief sketch does not purport to give a history of the various attempts made to enter into relations with the native princes, but it is chiefly concerned in showing how the power was wrested from the Portuguese by the English Trading Company three hundred years ago. Many famous names are associated with the brave efforts made by the English sailors to reach the lands of the East, India, Java, Spice Islands, etc., in order to satisfy their trading instincts, but it was not till 1600 that a number of men were bold enough to approach the ruling Queen Elizabeth, for permission to send several vessels to the East for the purposes of trade. A Company was formed and the newly formed band of merchants made their first systematic ventures in search of Eastern wealth. The story of these early voyages is full of interest but the detailed records are too often to be found in old and expensive books, hardly accessible to the ordinary reader. Capital was found for each voyage by separate groups of speculators, all, however, under the control of the parent syndicate. Most of the expeditions were successful and in some cases the profits exceeded two hundred per cent., but others were failures. It must be remembered that the English trade was practically confined to the Indian Archipelago, and even here they had been preceded by the Dutch and the Portuguese, and their plans were often thwarted by these foes who hesitated at no measures to prevent the English gaining a trade port. Soon they began to be

attracted by India and reports of early travellers related the "wordrous high civilization and boundless resources of the Indian Court." In 1607 Captain Hawkins by permission of James I visited the Emperor Jehangir and obtained permission to trade and to establish a factory at Surat, Hawkins pledging his loyalty by marrying 'a white maiden out of his palace.' But the Portuguese power was still paramount and the grant made to Hawkins after nearly three years' negotiation was fruitless. A certain amount of trade was carried on in Surat but the footing was not sure and any day they expected to find the Portuguese using force to drive them out. Attempts made by Sir Henry Middleton in 1611 were frustrated and he was perforce made to return to the old trade markets of the Eastern Archipelago. But the struggle between these two nations, was at last to be settled and Captain Best was the man who seemed most fitted for the task. The story of his brave fights may now be briefly recorded, for they were the direct means by which the British gained the first firman by which they were granted full liberty of trade with Indian subjects of the Mughal Emperor.

The authorities on which a history of the early settlements in India of the English must be based are the *Letters sent home to the East India Company* by their servants, many of which form most interesting reading. We are also indebted to the records of Purchas, a famous sailor, who gives in his "Pilgrimes" three separate accounts of the last phases of the great struggle with the Portuguese. There are several dates which are confused, but those accepted by Sir W. W. Hunter may be taken as perhaps the most correct. The India Office Records, edited by Bruce also supply a great deal of interesting information about this period. "In its attitude to its servants, the East India Company assumed the domestic responsibility of the medieval master craftsman to his apprentices and men under his roof. At each

factory the staff lived in one house, ate at the same table, met together for daily prayers, and had to be in by a certain hour at night. The early records are full of pious maxims and instructions as to brotherly conduct, 'no brabbles,' cleanliness of person, respect to superior officers and 'the preacher,' the care of health, and penalties for blasphemy or breaches of family morals. Gaming and dicing are strictly forbidden; excessive drinking and banquetting are denounced." It will thus be seen that in one respect the Company which was to make a bid for the Asiatic trade was similar to the mediæval trade guilds and that all its servants were supposed to be under the guidance and direction of a company of men who realised the need for great care with respect to the morals of its servants.

In February, 1612, four ships, the 'Dragon,' 'Oslander' 'Solomon' and 'James' left England under the command of Captain Best, with the intention of reaching Surat and there inaugurating a regular system of trade under the authority of the Mughal Emperor. These vessels were fully armed so that in case of war with the Portuguese, which was not unexpected, they would be ready to give a good account of themselves. The 'Dragon' had been purchased six years previously from the Earl of Cumberland after a good deal of haggling for the sum of three thousand seven hundred pounds. It was then known as the 'Mare Scourge,' and was a warship built by its owner for the purpose of attacking the Spanish vessels engaged in trade between their country and the Indies. It was a strongly armed cruiser of six hundred tons and under the new name 'Dragon' or 'Red Dragon' became the flagship of the Company. It would appear that only two of the four vessels came to Surat, namely, the 'Red Dragon' and the 'Oslander.' Captain Best had received orders from the Company that he was to use all means in his power to conciliate the goodwill of the Indian Emperor for trade on the

West Coast. But they had scarcely succeeded in obtaining permission from the local authorities when four Portuguese vessels, carrying 120 guns appeared off Swally with the intention of capturing the British vessels. Seeing the Portuguese Admiral and Vice-Admiral were separated by the tide and shoals from the rest of the fleet he determined on a bold attack. Owing to the 'Oslander' not being able to get free of its anchors the fight had to be waged by the one warship under the dauntless Captain Best. "He steered straight at the enemy, calmly reserving his fire till he got between the Admiral and the Vice admiral, and then delivered such a cannonade on either side that 'by an hour we had well peppered' them with some 56 great shots." The 'Red Dragon' suffered a little damage but anchored that night within sight of the Portuguese fleet. The next day, November 30th the battle was continued, this time the second English vessel joining in the fray. The silt of the Tapti river, together with the deposits formed by the sea currents had formed a long shoal which was dry at high tide. Inside this shoal lay the Swally anchorage, seven miles long and one and a half miles broad. In this narrow sea the English ships had the advantage over the heavy Portuguese in spite of their greater number of vessels. Purchas tells us in his account that the ships kept up a heavy fire 'and danced the hay about them so that they durst not show a man upon the hatchee.' The fight was renewed in the afternoon and kept up till the night when the enemy sent a fireship down upon the 'Oslander' but she was sunk by a severe cannonade. In this fight the loss of the Portuguese was probably three hundred while the English lost only three men, his only losses during the several battles; he fought from November to December 24th. The Portuguese hesitated to renew the attack and despite all the efforts of Best to engage them it was not till December 22nd that the squadron, reinforced by great galleons, appeared to do battle off

the coast. Robert Orme in his "Historical Fragments of the Moghal Empire, of the Morattoes, and the English Concerns in Indostan, from the year 1559," tells us that "Early in the morning Captain Best stood towards them, who weighed and put before the wind, cannonaded until out of reach, for they sailed better. The next morning at sunrise, he stood to them again, and maintained the fight till noon, when both sides weary parted." The Indian soldiers were all gathered on the beach to watch the fight, and when after four hours, they saw Best chasing the Portuguese fleet, they changed their opinion of the English whom they had considered only as fit for trading, and not to be compared with the other Europeans for fighting. But they thought the Portuguese would still defeat the small English force, but after the final battle of December 24th there was no further doubt as to the defeat of the pretensions of the enemy. The two ships returned, and "they resumed the intercourse with their factors at Surat, where the event of their fights raised the English reputation even in the opinion of all-will. "Thus the first official agreement with the Indian powers was made possible. The local authorities concluded a treaty which had to be confirmed by Imperial decree or Firman. It is interesting to note, as an instance of the type of man Best was, that when the Governor of Surat presented the trading agreement as a common letter of business, Best refused to take it, demanding that it be delivered with the usual solemnities. "This spirit brought the Governor and his son-in-law, the custom master, to Swally, who presented it in State and congratulated, but were very curious to know whether the English ships had not suffered more than was said, in the late engagement." It is from this Firman that the foundation of the British power in India may be said to date. According to the Firman the English traders at Surat were to be protected from all harm, and given every facility for the

lawful trade. The Emperor Jehangir agreed to welcome an Ambassador at his court; the customs dues on imports were not to exceed three and a half per cent. Other minor stipulations were made whereby the grievances arising out of the reprisals of Sir Henry Middleton were buried in oblivion, and promise of protection to all the property of the Company in the event of the death of the factors. In addition to the rights of Surat permission to build factories at three other places was given. "From this Imperial decree our legal settlement," says Hunter, "on the Indian continent dates. It makes a new departure in the history of the English Company, a new departure which was to end in our withdrawal from the Archipelago and our establishment in India." The achievements of the Portuguese on the seas for a hundred years had gained them great honour but the month of running fighting at the mouth of the Tapti shattered their power and opened India to other nations who sought to establish trade relations with her.

"THE SOCIAL EVIL."*

BY

THE REV. NORMAN BENNETT.

THE author has gathered together in this work a large amount of information in the form of statistics dealing with prostitution in its various forms as it affects national interests. Beginning with the difficulty of the discussion he shows how during the last half century public opinion has been roused in such a way that it is being increasingly recognised that the great Social Evils that exist must be resisted not only judicially but educationally, and that it is essential for the well being and development of the future race that old and young alike should be instructed in such a way as to make them face these problems practically and effectually. In order to emphasise this need Mr. Seligman makes a strong but none the less true statement. He says: "The great cities of the world vie with one another in the vast numbers of those who gain their living by immorality", and that "vice is the inevitable result of causes which Society has never yet been able to control". But in India and in the East generally these statements can be appreciated to the full, when the state of cities like Calcutta, Bombay, Colombo, and Madras is considered in regard to prostitution. In all large shipping centres here as at home, the demand for the prostitute is continuous—owing to the thousands of seamen who come and go and the fact that at these centres there are also numbers of young business men, who are free from the restraints of home, and are to a large extent limited for their Society to those of their own sex, gives a further *raison d'être* for the existence of the prostitute. As the author well expresses it: "In a great city one has no

neighbours. The main external check upon a man's conduct tends to disappear. No man knows the doings of even his close friends, few men care what the secret life of their friends may be. Thus with his moral sensibilities blunted, the youngman is left free to follow his own inclinations." Having said this much the author proceeds to outline the various ways in which the evils have been dealt with. He points out rightly that "experience has shown the futility of measures that aim to abolish the evil." The evil will exist as long as man exists. There is, however, every *a priori* reason to believe that its extent may be limited by a judicious policy of the prevention of the degradation of those who are not yet depraved and the rescue and restoration of fallen women who are still susceptible to moral influences. Among other methods for the preservation of public decency the author cites, strict regulations "prohibiting solicitation in the public places as well as indecent proposals from windows or doors of brothels." Here in Madras the existing law seems to allow prostitutes not only to occupy houses in the public thoroughfares but at any hour to be able to stand in indecent attire at the door, with impunity. Chapter V of Dr. Seligman's book is given up to the consideration of the vice in its relation to disease, and it is pointed out that not only venereal disease is contracted but many constitutional maladies as well, impairing the industrial efficiency of the individual and increasing his chance of becoming a burden on society. The transmission of the disease too is strongly dealt with as it concerns husband and wife, nurse and child or even by accidental contact. It is the usual precaution out in Morocco for travellers never to drink out of a glass without covering it first with a handkerchief from fear of syphilis. But not only is the matter dealt with strongly from the aspect of infection, but also from the moral standpoint. "To limit," says the author, "the num-

* "The Social Evil." Edwin R. A. Seligman. (G. B. Putnam's Sons, New York.)

ber of those who seek vicious pleasures and to prevent the furnishing of such pleasures to those who are inclined to seek them is one of the first duties of good government." And this limitation can be attained, he argues, from a more rational system of education, better housing conditions, the suppression of flagrant incitement to vice and the dissociating of vice from legitimate amusement. The pressure of poverty also has a powerful influence in compelling women to live a vicious life. In Madras, it cannot be doubted that poverty is in this way the background of many a young woman's downfall. With regard to moral and sanitary control, the whole book refuses such an argument absolutely on the grounds (a) that the creation of the impression that prostitution is safe is sure to increase the patronage of the prostitute. Strohmerg is quoted as citing that travellers are less restrained in cities which have the reputation of possessing a good system of regulation than they are elsewhere. (b) That by legitimatizing vice the state identifies itself with immorality. (c) That by creating a class of administrative chattels for the use and enjoyment of the vicious the state outrages the deepest sentiments of humanity. One of the saddest passages of the work is that dealing with the length of a prostitute's life. "The average length of time in which a prostitute exercises her trade is not more than half a dozen years, and this means that minors make up a considerable proportion of the total number of those engaged in prostitution. This in itself is a scathing criticism on the degradation of those who support houses of ill-fame. In the appendix, the Raines Law Hotel is shown to be the source of much professional vice by increasing the possibility of the prostitute meeting greater numbers of men. In New York City these hotels have been the centre of profligacy. The writer then devotes a chapter to the recommendations of an American Committee among which are the following most practical suggestions:

(1) To prevent in the tenement houses the overcrowding which is the prolific source of sexual immorality. (This might equally well be applied to the congested areas of Madras where the overcrowding is in like manner such an incentive to vice) (2) To sternly repress all public obtrusive manifestations of prostitution (3) To have pure amusements (4) To raise the conditions of labour, especially of female labour. (5) To give a better moral education (6) To reform minors who have fallen by means of reformatories. (7) More adequate hospital accommodations; and lastly to rouse public opinion so that the evil will be unceasingly condemned as a sin against morality. The last part of this most interesting and helpful work is devoted to the advance of the European movement showing how the public opinion has been roused, how particularly medical opinion has changed from the toleration of systems of regulation to a complete condemnation of it. This has evidently been the result of the various Congresses in Paris, Brussels and other great Continental centres. Among many pronouncements at these Congresses was the one "that it is especially necessary to teach young men not only that chastity and continence are not injurious but that these practices are wholly recommended from the medical point of view". This pronouncement is one of extraordinary significance. Passing to the White Slave Traffic Mrs Josephine Butler's efforts to arouse the public to a realization of a terrible evil are dwelt upon culminating as they did in the first International Congress in June 1899 in London when 120 delegates from various nations attended. Mr. W. A. Coote, of the National Vigilance Association was one of the leading movers in the Congress. This Congress brought into the light of day the close relation between the White Slave Traffic and the Special Morals Police, who while existing for the purpose of controlling vice, had actually become a part of the White Slave system. In New York a special

grand Jury was sworn in in 1910 to enquire into the Traffic and they made the following recommendations (which might well be introduced as part of the Madras Police scheme) (1) That no effort be spared in bringing to justice the so-called "pimp". When the character and prevalence of these creatures are more fully realised and public sentiment aroused in regard to them, every legitimate means should be used to exterminate them. (2) That the existing laws in regard to moving picture shows should be more rigidly enforced, and parents and guardians warned. Other equally sound and practical recommendations follow. The book sums up the position in these weighty words:—

It is entirely possible for public opinion to demand and secure the appointment of officials who shall be free from political and financial influence, and who shall administer the laws with intelligence and even-handed justice. It is entirely possible directly to rid our streets and tenements of the Social evil; possible to force its withdrawal from the conspicuous place which it occupies in the community to day, possible to surround with wholesome influences the places to which young people go for innocent amusements and to separate them from association with the liquor traffic and the Social Evil; possible to protect our children by enforcement of the child labour, education, and similar laws, from daily exposure to the moral contamination to which many of them are subjected; possible to hunt to their undoing the unscrupulous or indifferent business interests which profit from the exploitation of vice, unwitting that their cupidity is a baser sin than the lust on which it profits."

To students of life the book is a real incentive to further effort, shewing as it does the increased sense of responsibility which is now characterizing individuals and nations, while to scientific minds it is a valuable evidence of the gradual advance of medical and scientific opinion in the condemnation of all measures which condone vice or seek to regulate it other than by moral means.

THE LIFE AND TEACHINGS OF BUDDHA.—

By the Anagarika Dharmapala. This is a clear and concise account of the Life and Teachings of Lord Buddha. Written by a well-known Buddhist authority and in a style specially intended for non-Buddhists, the book is bound to be widely circulated and appreciated. With an appendix Price As. 12. To subscribers of the "Indian Review" As. 8

DADABHAI NAOROJI'S BIRTH-DAY MESSAGE.

Vesava, 6th September 1912.

I OFFER my most heartfelt thanks to all friends in India, England and South Africa, who have sent me their kind congratulations and good wishes on my 88th birthday on 4th instant.

I am deeply grieved at the death of Mr. A. O. Hume. He was a true and whole heartedly devoted friend and benefactor of India. Indians can and will never forget the deep debt of gratitude which they owe to him.

The great and glorious event in Indian History, the Announcement in India in person by His Majesty the King-Emperor, of the Coronation of His Majesty has taken place with entire satisfaction to all and great helpfulness to the Indian people.

Let us now calmly consider what this most auspicious event leads us to expect for the future for the Indian people.

His Majesty has most graciously and feelingly expressed many times the most earnest desire for the prosperity of the Indian people. I give here only a few extracts.

We earnestly pray that God's Blessing may rest upon our Indian Empire, and that peace and prosperity may be ever vouchsafed to its people.

Six years ago I sent from England to India a message of sympathy. To-day in India I give to India the watchword of hope. On every side I trace the signs and stirrings of new life.

Their interests and well-being will always be as near and as dear to me as those of the millions of my subjects in other quarters of the Globe * * * May the Almighty ever assist me and my successors in the earnest endeavour to promote the welfare and to secure to it the blessings of prosperity and peace.

These gracious words show clearly that there is an intensely earnest and sincere desire in the hearts of Their Majesties to secure and promote the prosperity of the Indian people and to hold their interests and well-being as near and as dear to them as those of the millions of their subjects

in other quarters of the Globe. And that reading between the lines of all the incidents, despatches, and events of this ever-memorable visit of Their Majesties, it seems that there is also thought out and determined upon a new evolution to secure the prosperity of the Indian people.

Be my thought about the evolution as it may, there can be no question about the earnest desire of Their Majesties to hold the Indian people as near and as dear to them as the Colonies and to secure to them the blessings of prosperity and peace.

The question then arises how to secure this benign and glorious result.

It is our great good fortune that the true reply to this question is given to us practically by the British Government itself in the notable instance of the Restoration of Mysore to the glory of the British name, and to the credit of Lord Salisbury and Lord Idlesleigh with the benign approval and influence of the great good Queen.

I give below some extracts from my letter of 21st March 1896 to the Lord Welby Royal Commission which will show that the Restoration of Self government to the people themselves restored prosperity to Mysore and similarly will prosperity be restored to all other parts of British India as Their Majesties so earnestly desire.

Letter of 21st March 1896 to the Welby Royal Commission:

I am glad to put before the Commission that the problem has been not merely enunciated, but that, with the courage of their convictions, two eminent statesmen have actually carried it out practically, and have done that with remarkable success. * * * The result was, the memorable and ever to be remembered with gratitude despatch of 16th April 1867 of Lord Idlesleigh for the Restoration of Mysore to the Natives notwithstanding thirty-six years of determined opposition of the authorities to that step. * * * This being once settled, though against all previous opposition and necessitating the withdrawal of Europeans from the services, all the authorities and officials concerned, to their honour and praise, instead of putting any obstacles in the way or trying to frustrate the above intentions, discharge their trust most loyally and with every earnestness, and care, and solicitude to carry the work to success. The Blue Books on Mysore from the despatch of 16th April 1867 to the installation of the late Maharaja in 1881 is a

bright chapter in the History of British India. * * * I think I need not enter here into any details of this good work from 1867 to 1881 of the British officials. The Blue Books tell all that. Of the work of the late Maharaja from 1881 till his death at the end of 1894, it would be enough for me to give a very brief statement from the last address of the Dewan to the Representative Assembly held at Mysore on 1st October, 1895, on the results of the late Maharaja's Administration during nearly fourteen years of his reign, as nearly as possible in the Dewan's words. The Maharaja was invested with power on 25th March 1881. Just previous to it, the State had encountered a most disastrous famine by which a fifth of the population had been swept away, and the State had run into a debt of 80 lakhs of rupees to the British Government. The cash balance had become reduced to a figure insufficient for the ordinary requirements of the Administration. Every source of revenue was at its lowest, and the severe retrenchments which followed had left every department of State in an enfeebled condition. Such was the beginning. It began with liabilities exceeding the assets by 30½ lakhs, and with an annual income less than the annual expenditure by 1½ lakhs. Comparing 1880-1 with 1894-5, the annual revenue rose from 163 to 180½ lakhs, or 75.24 per cent, and after spending on a large and liberal scale on all works and purposes of public utility, the nett assets amounted to over 170 lakhs in 1894-5 in lieu of the nett liability of 30½ lakhs with which His Highness's reign began in 1881.

	Rs.
In 1881 the balance of State funds was ...	24,07,433
Capital outlay on State Railways ..	25,19,198
Against a liability to the British Government of	80,00,000
Leaving a balance of liability of Rs 30½ lakhs	
On 30th June 1895	
Assets	
(1) Balance of State Funds	1,27,23,615
(2) Investment on account of Railway Loan Repayment Fund .	27,81,500
(3) Capital outlay on Mysore Harhar Railway ..	1,48,03,306
(4) Capital outlay on other Railways	41,33,790
(5) Unexpended portion of capital borrowed for Mysore Harhar Railway (with British Government) ...	13,79,495
	<hr/> 3,60,21,306
Liabilities—	
(1) Local Railway Loan Rs.	20,00,000
(2) English	1,63,82,801
	<hr/> 1,83,82,801
Nett assets	
Add other assets—	1,76,38,503
Capital Outlay on original irrigation works	99,08,935

Besides the above expenditure from current revenue there is the subsidy to the British Government of about Rs 25,00,000 a year, or a total of about Rs. 3,70,00,000 in the fifteen years from 1880-1 to 1894-5, and the Maharaja's civil list of about Rs. 1,60,00,000 during the fifteen years also paid from the current revenue. And all this together with increase in expenditure in every department. Under the circumstances above described, the

administration at the start of His Highness's reign was necessarily very highly centralized. The Dewan, or the Executive Administrative Head, had the direct control, without the intervention of departmental heads of all the principal departments, such as the Land Revenue, Forests, Excise, Mining, Police, Education, Majrohi, Legislative. As the finances improved, and as department after department was put into good working order and showed signs of expansion, separate heads of departments were appointed, for forests and police in 1883, for Excise in 1889, for Majrohi in 1891, and for mining in 1896. His Highness was able to resolve upon the appointment of a separate Land Revenue Commissioner only in the latter part of 1891. Improvements were made in other departments—Local and Municipal Funds, Legislation, Education, etc. * * *

And all the above good results are side by side with an increase of population of 18.34 per cent in the ten years from 1881 to 1891, and there is reason to believe that during the last four years the ratio of increase was even higher. During the fourteen years the rate of mortality is estimated to have declined 6.7 per millenium.

But there is still the most important and satisfactory feature to come, viz., that all this financial prosperity was secured not by resort to new taxation in any form or shape * * *

Such is the result of good administration in a Native State at the very beginning. What splendid prospect is in store for the future, if, as heretofore, it is allowed to develop itself to the level of the British system with its own native services * * *

I stop my extracts here as the point I desire to make in this letter is to show how by self-government may be attained the most earnest desire of Their Majesties, viz., securing to the Indian people the blessings of prosperity and peace.

I may however just remark here that the same remedy of self-government applies to all other questions—Political, Agricultural, Social, Commercial, Industrial, Educational, &c, as everything depends upon prosperity.

A great responsibility rests on Mysore to turn to the best account its good fortune, not only for its own sake but for the sake of all India.

Having said so much as above, and without entering into the consideration of the events and incidents of the past sixteen years, since my letter to the Royal Commission was written in 1896, which have so happily ended in the auspicious Announcement of the Coronation in India, by Their Majesties themselves, may I not indulge in the "Hope" that before long St. George of Eng-

land will bear aloft the glorious Standard of the mighty British Empire including India with her many self-governing, free and prosperous peoples enjoying rights and responsibilities akin to those of the Colonies. That indeed would be a proud day for the country under the all-spreading "Chhatra" of benign Britain.

THE LATE GENERAL BOOTH.

BY MR. B. NATESAN.

It is not a mere conventional phrase of extravagant adulation that the most remarkable and enduring of the benefactors of the nineteenth century was General Booth. The Victorian age was essentially prolific of great personalities but as King George observed in his sympathetic message to the new General "only in the future shall we realize the good he has wrought for his fellow creatures." There have been great names in England in every field of human endeavour but there is scarcely a parallel in contemporary history that demonstrates the eternal truth of the saying that character is superior to the intellect. Mr. Booth belongs to a class of men that is day by day decaying in the world and which the English soil is particularly barren of production. Indeed the ecstasy of divine madness which is rather the attribute of the oriental genius as of the middle ages of Europe is peculiarly odious to the placid common sense of the suburban Englishmen. It is the tendency of our civilization to label enthusiasm as lunacy and prayer as a frivolity. Such men and women of yore as St. Francis and St. Teresa are a rarity in these days. To find a parallel to the character of the late General we have to go back to the names of George Fox and John Wesley. Like them his strength lay not in his understanding but in the primary affections and sympathies. Like them he felt the awful realization of the first 'conviction of sin.' Like them too

he laid his hand upon the sword of the spirit and called on all man-kind to follow him and dethrone the Devil.

William Booth was born in the Church of England at Nottingham on April 10, 1829. His father belonged to the English Church much as he belonged to the parish and to the county. Himself the heir of unenviable illiteracy, he

THE LATE GENERAL BOOTH.

shared with his neighbours something of the stern practical sense of the work-a-day world. There was nothing extra-ordinary about him except that he was gifted with super abundant energy and uncommon powers of acquisition. His wife seems to have been a woman of marvellous spiritual fervour coupled with the spirit of practical benevolence and passionate affection. The son inherited these valuable traits of character from the parents and turned them to such good account in the foundation and maintenance of the Salvation Army which was at once the main purpose of his life and the inspiration of his earthly labours.

In early years William grew up in an atmosphere of unrest in a hot bed of quasi revolutionary discontent. The poverty which he

witnessed around him filled him with a spirit of revolt against constitutional authority. He became a physical force chartist at the age of thirteen, joined the Wesleyans and preached in the congregations of the "New Connexion." About the middle of the sixties again he quitted his special missionary functions and founded the "Christian Mission" in London at which he laboured in conjunction with his astute wife. In 1877 the idea of the Salvation Army was first formed and thereafter the story of his life is the history of this organization. One of the cardinal principles of this institution was that no retaliation was allowed to the most violent persecution. Indeed the General appealed to the ancient and simple faith of Jesus but regulated his campaigns by pointing to the inherently militant spirit in man which was at once the secret of his magnetic influence and the army's rapid extension. Trusting as he did in the crude and orthodox evangelism of popular Christianity and implicitly relying upon the authority of the divine revelations he shared with the common people their simple beliefs and hopes and fears. But the fervour of his spiritual devotion did not end in those moments when "God in man is one with man in God." He felt the pangs of poverty as if he were the one living conscience of an ever-suffering humanity. And the following account from a contemporary gives the gigantic scale of his enterprise in affording relief to the afflicted part of the English race —

No mention of the work of General Booth can be made without reference to the great "Darkest England" scheme, which was the outcome of the publication in 1890 of General Booth's *In Darkest England, and the Way Out*. The scheme there outlined evoked widespread interest, and subscriptions amounting to £20,00,000 came pouring in. From the very start the work among the poor and homeless was carried on with tireless energy, and branch after branch was opened for the amelioration of the lot of the poor. In the year 1901, £18,433 was received for the provision of cheap food and lodging, and in that year the "elevators" or factories carried on by the Army received 8,426 persons, besides 2,559 women and girls received into rescue homes. Under the scheme's large farm colony is carried on at Hatfield, in Essex, and the emigration department is one of the most important parts of the work, the passage money received in

1907, the highest year, being £85,014. Another farm colony has recently been started at Boxted, near Colchester, a scheme which was unfortunately brought into unfavourable notice recently through the refusal of some of the colonists to work and their subsequent eviction. Some idea of the magnitude the work carried on under the Darkest England scheme may be gathered from the fact that the income for the year 1909 was £30,591, and the value of the property held £229,645.

But behind all this work stands the figure of a venerable personality. The earlier attempts of the General in gathering the strayed and the forlorn to the flock were such as would have driven a less indomitable will to despair. The novel yet barbaric methods of the Army awakened universal antagonism. Least of all could an age of science and rationalism tolerate the absurdities of what it thought to be a revival of antiquated mummeries. It laughed at the band of singers and preachers, their poke bonnets and red Jerseys, their timbrels and their drums. Huxley in one of his happy and memorable phrases sneered at "the Gospel of Corybantic Christianity" and even Spurgeon feared that Booth was bringing religion into contempt. "It rolled Jack Cade and George Fox into one, and the result was General Booth. Half-fanatic, half-fool, half-impostor and half-mad—such was the world's verdict" on the great apostle of the poor.

The brilliant Mr. G. K. Chesterton has somewhere observed in one of his characteristic and paradoxical epigrams that the dances and the drums were the only sensible part of the army's programme. We need not take him quite at his word. But the fact remains that the mass of mankind were more and more drawn to these popular demonstrations. Doubtless the simple faith of the great commander and his unflinching solicitude for the wretched and the cast-aways of society have made him the unexpected providence of an enormous multitude of helpless mortals. From the time of the Army's operations in America in 1880 there has grown a network of salvation institutions in the remotest corners of the world. It is a miracle of Military genius to have

occupied within three decades 59 countries with the salvation literature in 31 languages.

In all his work India was not forgotten. Booth became one of the apostles of the distressed classes in our country. It is an interesting account of the Army's work in India from the pen of Mr. Booth Tucker, the head of the campaign in this country.

"Already a devoted band of more than 2,500 officers, and tens of thousands of converts and adherents are engaged in carrying on the Salvation Army work in India and Ceylon. Our operations include the Marathi, Gujarati, Bengali, Punjabi, Himalayan, Telugu, Tamil, Malayali and Singhalese nations. In our primary village day schools there are more than 10,000 children, while in our industrial homes for boys and girls more than 800 children are being trained to lives of usefulness, loyalty and devotion. Our village banks with a capital of about one lakh, founded some 14 years ago, have led the way in the great co-operative credit movement, which is now covering the country with its beneficent agencies. A number of our officers, who are skilled in accounts have been appointed as Benevolent Baniyas."

In the great industrial awakening of India, we may also claim to have played a leading part. Nearly 1,000 rapid handlooms have been supplied to the weavers of India from Camorin to Kashmir, from Sind to Assam. Weaving schools have been established, and expert weavers supplied to teach the new and improved methods, and a great impetus afforded to what has been regarded in the past as a decadent industry.

Towards the criminals and criminal tribes of India our special attention has been turned. The prison population numbers about one lakh of souls, while the criminal tribes, who constitute so great a problem by their wandering and predatory habits, probably number at least three or four times as many more. Our efforts to reach and regenerate these different classes have already met with remarkable success and are capable of great expansion.

During the recent famine our organisation has also taken a leading part by the introduction of *cassava* as a famine fighter. More than 2,000 maunds of this new food have been sold at cheap rates, and the plant itself introduced in many new localities. When grown locally, as it can be in almost every part of India, the flour can be supplied at the rate of about one maund per rupee. A vigorous campaign has been carried on, and in view of the prevailing high prices of ordinary food grains, the work should be followed up.

Finally our adoption of Indian dress and customs has enabled us to inaugurate and carry on a loyal Swadeshi patriotic movement, the value of which can hardly be exaggerated to both governed and governing classes. We have shown that a hearty and unswerving loyalty to the British Government, from which such immense benefits have been derived by India, is not inconsistent with an enthusiastic love for India and a boundless devotion to her welfare and interests. In the parts of India where our work has been longest established, and is best known we have gained the utmost confidence and affection of the people of India, who look upon the *Mukhtians* as part and parcel of the life of the country, and as one of their national religions."

It is sad to think that such a benefactor is now no more. But there is no doubt that Mr. Bramwell Booth will walk in the footsteps of his lamented chief and father. As he says in his epistle to his comrades:

MR. BRAMWELL BOOTH THE NEW GENERAL OF THE SALVATION ARMY.

"It remains to us to prove true to our love for him by fulfilling his hopes and his predictions that we should not allow his departure to damp our zeal for God or slacken our fight for the blessing of our fellows."

"The world is poorer to-day, how much poorer we cannot yet realize, by the loss of one who has loved with his whole heart its poorest and its worst, loved them so truly, so wisely, so practically. Let us still show that we are, by God's grace, doing all that in us lies to supply that great world's needs as our dear General would have wished."

"God bless you, He will help us."

Mr. Bramwell has had for long the exceptional benefit of his illustrious father's guidance and the new leader brings with him the inheritance of those marvellous qualities of head and heart that assured the success of this remarkable Christian movement. Indeed he is the only Salvationist that occurs to the ordinary mind as the legitimate successor of the founder. It will be an injustice to him to attribute the honour solely to the accident of birth. "He arrives there after years of strenuous activities, of over-mastering zeal for the kingdom of God, of love for man, of true hearted devotion to the service of the Army." Through every grade of the Army's work he has passed his life. In many a slum and corner of the world he too has carried the light of love and charity, he too has carried the voice of God to console the afflicted. Even like his father he has lived the life of a latter day Saint. "As was said of the Apostolic workers one planted and the other watered, so it might be truly remarked that the father won the multitudes and the son organised their spiritual home." He has won the heart of the people and the people will never forget him. Both father and son alike have exemplified the observation of the poet who sang:

Give love and love to your heart will flow
A strength in your inmost need.
Have faith and a score of hearts will show
Their faith in your word and deed.

We cannot conclude the work of the Salvation Army and this brief sketch of its great founder in more fitting terms than by quoting the exquisite stanzas he would have wished for his epitaph. General Booth died on August 20 and his favourite refrain was sung while the earthly remains of this great Soldier of Christ were lying-in state:

When the trumpet of the Lord shall sound and time shall be no more

And the morning breaks eternal, bright and fair,

When the saved of earth shall gather over on the other shore,

And the roll is called up yonder, I'll be there.

SILK-WORM REARING IN INDIA.

BY

MR. M. D' KATH.

A perusal of the article on 'the Art of Silk-worm Rearing in India' in the June number of the *Indian Review* by Mr. H. Subba Rao compels me to send you the following note with some observations on the paper and I hope you will not grudge the same some place in your widely circulated periodical.

It is unfortunate that the heading Mr. Subba Rao has chosen for the article does not suit the latter. The title is 'Art of Silkworm rearing in India.' I do not know what hereally means by this title and I am open to correction. By the heading one would expect to find in the paper among other things relating to Sericulture, the methods of rearing silkworms in India—how the worms are bred, what are the materials required in rearing, the difficulties experienced, diseases, cost, outturn estimate and so on. I for one think that these are the main points which should be included in an article with the above heading. He dwells on the history of sericulture in India, on the different kinds of domesticated and wild silkworms, on the results of his experiments re. colour of cocoons, quality of silk &c; but he has said hardly anything about the art itself, as to the methods and ways of rearing the different kinds of silkworms—information which is most necessary for laymen who might wish to profit by the article.

Speaking of silk rearing centres at the beginning of the article he has forgotten to mention anything of such an important silk rearing province as Bengal. In South India itself besides Mysore Mr. Rao does not speak of any other silk centre. Perhaps he is not aware there are two other places where silk-worms have been reared for the past many decades and that they also con-

tribute a good share of the supply of silk for the whole presidency viz., Kollegal in the Coimbatore district and Berigai in the Salem district.

It is stated that the quality of silk exported from India is pronounced by experts to be as fine as that produced by France, Italy, Spain, Greece and Japan. I shall thank him to let me know who the experts are and where they have said so, since I have my own doubts about this statement. It is more so since I find in some important books that Indian silk is far inferior to European silk either as cocoons or as reeled silk. The following references among others show that European silk is far superior to Indian silk —

(1) Mukerjee's Handbook of Sericulture pp 287
(2) Mukerjee's Handbook of Agriculture, latest Edition pp. 420-422 (3) Watt's Dictionary of Economic Products. Article on Silk separately printed, Page 56. In the latter reference the opinion about Indian silk runs thus — "Taking it (Indian silk) all in all, it is the worst silk in the market, inferior to European, China and Japan Silk &c." These references make me doubt the statement and as such I shall be obliged if he will kindly tell me who the experts referred to are.

Mr. Rao appears to have made some researches in the Ramakrishna Silk Farm and found out that there are nearly 10 kinds of silk worms that spin cocoons of commercial importance. The tabular statement given also shows that he must have made some experiments if I am not a quinsive I should like to know with how many kinds he experimented before the revelation came that there are 10 kinds of commercial silkworms. One Mr. Hailey is found fault with for saying that there are seventeen varieties of Bombycidae. I for one think Mr. Rao is mistaken in so doing. In the family Bombycidae (it is a pity the term Bombycidae varieties, species &c., are used in a loose manner) there are not less than seventeen kinds. This can be found out easily if only one refers to Watt's article on Silk where he enumera-

tes the chief Indian Bombycidae (Pages 2-5). They are briefly as below:—

Genus <i>Bombyx</i>	6 or 7 kinds.
" <i>Ocinara</i>	3 kinds.
" <i>Theophila</i>	5 "
" <i>Trilocha</i>	3 "

And yet Mr. Rao says his theory (Mr. Hailey's statement) is unsubstantiated! By the bye I may also tell him if he is not already aware that there are wild silkworms even among Bombycidae feeding on other plants than mulberry and that the group Saturniidae does not exclusively include all wild silkworms although in popular usage 'wild silkworms' means members of the Saturniidae. For examples of Bombycidae wild silkworms see Wardle's 'Wild Silks of India' page 4. Talking of the reeling of Bombyrid silk it is said that the cocoons must be boiled in hot water and *strong solvents* I have not known any solvents being used for Bombyrid cocoons. I should like to know whether any are really used and if so where. The information regarding the fibre length of Bombyx cocoons appears very phenomenal to me, especially the record length of 4000 yards in the Punjab!!! Has he information as to which particular kind of cocoon it was that showed this record length of fibre? I am very anxious to know this since I only remember the following fibre lengths generally found among mulberry feeding silkworms:—

<i>Bombyx</i> species of Bengal	200-250 yards.
" species of S. India	300 "
" more	800-900 "

He seems to have devoted some time in verifying the different kinds of mulberry eaten by the different kinds of worms and to have succeeded in tracing out 4 of the species. As there is some confusion among Botanists regarding the different varieties of mulberry found in India both introduced and indigenous he will be rendering a great service if he will kindly state what are the four species he has traced out and where these are

now found in India giving their local names, and later the results of his investigations into the rest. Now to his tabular statement, which he says shows the result of his experiment with different worms. He must have taken a lot of trouble in rearing these different worms, noting their characteristics and recording his observations. I am anxious to see the different kinds of worms he has experimented with. Will he kindly spare me a cocoon or a mature worm of each of the kinds he experimented with either gratis or for price? I know I am giving him some trouble but I hope my anxiety to learn is sufficient excuse.

Speaking of the tabular statement itself - I am shocked to find some glaring errors. Two entries re *Bombyx mori* are huge blunders viz., *2 crops in a year and reared throughout sericultural centres*. That this worm *B. mori* is one which produces but a *single crop* in the year and is never cultivated anywhere in India except Kashmir and a few places in Punjab if at all. *B. mori* is the univoltine worm, the silk worm *par excellence*. This is the true European silkworm now generally reared in India. See Watt P. 15, Wurdle P. 3 Another glaring example of his ignorance of sericulture in S. India is the *nil entry* regarding *B. meridionalis* in the tabular statement though he says he carried on experiments. Mr. Rao has apparently nothing more to say about this silkworm as he puts against this insect "not known"! *This insect is the silkworm that is reared all over Mysore and other parts of Southern India*. From the tabular statement one is led to believe that the silk produced in Mysore, Kollegal etc, is the product of *Bombyx mori* which however is not really the case. In the statement the Tassar worm is said to be reared in Mysore among other places. I am anxious to know from Mr. Subba Row where this worm is reared in Mysore, who rears it and what are the local methods adopted. The bulk of the Tassar cocoons brought to the market is the result

of collection of cocoons in the forests by these jungle tribes and not rearing the worm.

Mr. Subba Rao appears to know of a thousand families living a decent life by silkworm rearing. May I know where these families are and which kind of silkworm they are rearing. Information on this matter giving details as to the methods, outlay and net profit which enables them to lead a decent life will be very valuable to and thankfully received by many other families in other parts of the country anxious if possible to live decent lives by taking to this industry.

THE NIZAM'S NEW MINISTERS.

BY

MR. N. RAJARAM.

— — —
NAWAB SALAR JUNG III.,

THE Nizam's new Prime Minister, Nawab Salar Jung III, comes from a noble family which traces its descent from Shaik Owais of Karini who lived in the time of the Prophet. The first of the line, to wield great power and influence in Hyderabad, was Mir Alum who was Prime Minister to H. H. The Nizam Sikander Jali (1803-1829). His son-in-law and grandson were also Prime Ministers at Hyderabad; and Sir Salar Jung I was his great grandson. Under him the state progressed rapidly; and none of his ancestors outshone him in statesmanship or loyalty to their sovereign. His son, Sir Salar Jung II succeeded him, and continued in office for four years. When he died in 1889 the present Prime Minister was barely a month old. It is a striking coincidence that the grandfather was Prime Minister at the age of 24, the father at 21, and the grandson at 23. In Hyderabad the appointment of a minister goes by a certain well-understood tradition, and the present incumbent had stepped in as a matter of right to the highest post in the Dominions,

Nawab Mir Yousuf Ali Khan Bahadur Salar Jung III—to give his full name and titles—was born on the 14th June 1889. The late Nizam showed much interest in the training of the young Nawab, and honoured him with the titles of Khan Bahadur and Salar Jung III in 1898.

He entered the Madrasah Aliza (an institution founded by his late grandfather, Sir Salar Jung I for educating the sons of the noblemen of the state) worked up from the lower standards, passed the Middle School examination with credit. After this he went through a special course of studies in English and science. He has acquired a sound knowledge of Urdu, Persian and Arabic. The young Nawab has a taste for fine arts, painting being his favourite hobby. He is a good athlete and takes part in Tennis and Cricket. Though of a retiring disposition, and simple and direct in his manners, he takes a far deeper interest in the larger problems of life than any of the young nobleman of Hyderabad to day. How well impressed was the Nizam with the Nawab's qualifications for administrative work is evident from the fact that soon after His Highness's accession to the throne he restored to him the Nawab's vast estates which for a long time had been managed by a Committee of Revenue officials. The estate is much larger than Pudukota or Cochin in Southern India. It comprises six taluka situated in the various districts of the state, and covers an area of 1468 square miles with an annual revenue of ten lacs. There are situated within the Nawab's Jaghir many places of historic and archeological interest such as the hill forts of Kopal and Korgi, and the world-renowned cave temples of Ajanta.

MR SYED HUSSAIN BILGRAMI, C.S.I.

Mr Syed Hussain Bilgrami, who has been appointed assistant to the Prime Minister, was born at Gya in 1844. He was educated at Bhagalpur and Patna whence he was sent to the Hare Academy Calcutta where he graduated in 1866

taking a high place in the First class. He then entered the Educational department of the United Provinces, and was appointed Professor of Arabic at the Canning College, Lucknow. In 1872 when Sir Salar Jung I was on a visit to Lucknow, Mr. Bilgrami was introduced to him, and being struck with the young man's gifts, Sir Salar Jung offered him an appointment in Hyderabad. In June 1873 Mr. Bilgrami entered the Hyderabad service as one of the private Secretaries to the great Minister. In 1876, he followed Sir Salar Jung to Europe, and on his return Mr. Bilgrami was made the Secretary to the Miscellaneous department which, besides some minor branches of the administration, had control over the education of the State. He served in this capacity till the accession of the late Nizam to the throne, when he was appointed His Highness's Private Secretary receiving the title of Ali Yar Khan Bahadur Motamam Jung. Some years later the title of *Imad ul mulk* (Pillar of the State) was added to him in appreciation of his valuable services to the state. From 1887 till his retirement in 1907 he was the Director of Public Instruction in the state and in spite of many difficulties he developed with brilliant success the department committed to his care. The spare time, which Mr. Bilgrami could afford amidst his multifarious duties at Hyderabad, was spent mostly in furthering the cause of education among the Indian Musalmans. He has been for many years a trustee of the Mohamedan Anglo Oriental College at Aligarh and those connected with that institution know what a heavy debt of gratitude it owes him, for his valuable, and unostentatious work in its behalf. He presided over the Mohamedan Educational Conference held at Rampur in 1900, and delivered a sober and thoughtful address full of practical suggestions to his co-religionists. Lord Curzon appointed him a member of the University Commission, and latterly he was a nominated Member

of the Imperial Legislative Council for two years. His speech in the debate of the Council in 1903 for a larger grant to primary and secondary education created a great stir in the country. In 1906 he took a leading part in guiding the All-India Moslem deputation which waited on Lord Minto; and the original draft of the memorable address was drawn up by Mr. Bilgrami. Soon after the passing of the Council of India Act of 1907, he was appointed a member of the Council of the Secretary of State for India, and as such he served on three of the committees between which the work of the Council is distributed, viz., the Revenue, the Judicial and Public and the Stores committees. His services were much appreciated by Lord Morley and his colleagues, but unfortunately the vigour of the English winter told upon his health, and he had to resign his place in the Council in November 1909. Since then he had made Hyderabad his home and was engaged in some literary work. Bilgrami has been a student all his life, and the rare command he has succeeded in gaining over the English language places him in the first rank of Indian scholars. Besides being well versed in Arabic and Persian, he has a sound knowledge of some of the modern languages of Europe. He is the author of several works, the most important of them being a life of Sir Salar Jung I, and a historical and descriptive sketch of H. H. The Nizam's Dominions.

The association of such a man of varied experience and fine scholarship with the young Salar Jung who has everything in his favour to start with, forebodes much good to the Nizam's State and one will only wish God-speed to the two new Ministers of Hyderabad in their new spheres of life.

THE CRIMINAL AND THE COMMUNITY.*

It has been said by some one that the only difference between the judge on the Bench and the criminal in the dock is a difference of a few yards or of opportunity and temptation. The idea was enlarged upon, not long ago, in a small book entitled "Our Criminal Fellow-Citizens," from which it is clear that modern criminologists and social reformers are coming to realise the great Hindu truth—"Thou art That." "There, but for the Grace of God, go I" they say—and they are right. Dr. James Devon, medical officer of His Majesty's Prison at Glasgow, and the author of the latest contribution to this somewhat neglected aspect of sociology, enlarges upon this theme through 340 pages of extraordinarily interesting matter. His style is terse, pointed, and critical, and his thought is brilliantly illuminating. Professor Murison, who contributes a valuable introduction, says of him: "His position is perfectly clear; he sees precisely, and he states directly, simply, and definitely what he sees and what he thinks about it, very frequently driving home a point with epigrammatic force. If he throws overboard unceremoniously what he regards as mere lumber accumulated by the industry of speculation divorced from experience; if he betrays some impatience with existing theories and systems; if he advances his own views with confidence—the handling is at any rate piquant, and brings the matter promptly to ahead." And those views are crisp and definite. First, Dr. Devon urges that there is no such person as a criminal isolated from all social surroundings, but that, like all other members of the community, he is a product of his environment. Ergo, in order to understand the criminal, we must seek, by all the means in our power, to study and comprehend that environ-

* By Dr. J. Devon, John Lane, London,

ment, not only with a view to apportion the blame for his actions, but in order to prevent its repetition by securing a reformation of this social derelict. Secondly, that our present penal systems are designed for the punishment of the criminal and not for his reformation; the obvious corollary being that he is punished and not reformed. Thirdly, that the criminal can be not only improved by rational treatment, but that criminality itself, as we know it, can be largely prevented. Fourthly he shows how, in his opinion, it can all be done. His book is divided into three distinct parts, the first treating of "The criminal," the second, of "common factors in the causation of crime," and the third, of "The Treatment of Criminal." Dr Devon persists in regarding the criminal as "one of us," and in Part I, after a somewhat contemptuous reference to the scientific criminologist who, like the scientist greatly attempts to obtain the "pure culture," untainted by its surroundings, he deals with the relations of heredity, insanity, and physical defects to crime, concluding with a study of the criminal. In Part II, he treats of the influence of drink, poverty, destitution, overcrowding, immigration, social conditions, age, and sex, upon the individual, and then discusses the subject of punishment. Perhaps Part III, the constructive portion of the book, is the most interesting and useful. Here Dr Devon sets forth the machinery of the law, discusses the prison system, the prison, and its routine, describes the position of the prisoner on liberation, condemns the Inebriate home and similar institutions, and analyses the Prevention of Crimes Act (1903). The final chapters deal with the family as the model and social unit, alternatives to imprisonment and suggestions for the improvement of the treatment of offenders. The following statement gives the keynote to the author's views: "One great mistake made by those who consider social problems is that they either regard man apart from his surroundings or as one of a mass, instead of as

a member of a family or group. Family life is the common form of social life, and whatever its defects, it is the form that is likely to persist without very great modification." This is a book that should be in the library of every student of sociology, of every social reformer, and of every statesman. It is packed with valuable thoughts.

Current Events.

BY RAJDUARI.

THE NEO-COVENANTERS AT ULSTER.

THE outstanding feature of British politics during the last four weeks is the dust-storm which Messrs Bonar Law, Carson, Smith and company have raised. Their consciences having upbraided them of the heinous crime of seditious language which was recklessly used against the King's Government, let alone the showers of pelting abuse thrown at the Ministers, and the Press, even their own friendly Unionist organs, having condemned the loose and vulgar tongue they had given rein to, other tactics had to be employed. Lord Cecil was for bluff also, but differed from his hysterical and irresponsible colleagues in the method of carrying their wrathful resistance to the Home Rule Bill. He was all for attack but with stately dignity. Born and bred an aristocrat of aristocrats, there was nothing in his horror for him as far as the vulgar methods his confreres in the impotent Ulster campaign had employed. He desired to dish the Ministers but in the most "majestic" way possible. So that when all things were considered, the ultra resisters to the Home Rule Bill had no recourse left but to devise the parody of the old puritanical Solemn League of Scotch Covenanters who avowed that they would lay down their lives for the great cause for which they were prepared to fight. That stern but

brave and uncompromising band were pure and undefiled in their motives. They were in no way misguided. They firmly and conscientiously believed what they said and prepared to carry out what they had solemnly sworn to. Those Covenanters were indeed a righteous body, fully prepared and doomed to die. However we may differ from them as to the solemn steps they took, we can have nothing but the highest respect for them. The times and conditions under which they covenanted to fight were entirely different from those now in vogue. Indeed, speaking plainly, these Ulster men who are breathing fire and fury, and talking brimstone and dynamite are making themselves so many misguided fools while serving under the standard raised by Mr. Bonar Law, Sir Edward Carson and Mr. Smith. In these times of free and plain speaking there is no scope to follow the example of the Covenanters. Neither the conditions are at all identical. At the best there is no element of altruism, no element of stern spirituality about the leaders of these Neo-covenanters who differ from the old as widely as the Arctic pole is asunder from the Antarctic. What is at the bottom of all this hollowsounding agitation? Absolutely nothing save that cursed *party spite* to drive away the existing Government from power, because the Unionists want to get in. You may have your organisations; and your brass bands, like those of the Pope; you may have your banners and bannerets; you may have all the most up-to-date trappings of a loud demonstration; and you may have parchment paper by the yards on which the misguided might be asked to sign their names under solemn oath. But to what avail? It is all hollow. It is to be presumed the sober majority of the United Kingdom know its hollowness and refuse to be carried away by these fantastic modes of overawing the Government which is laughing in its sleeves. At the best they are "anarchists in kid gloves" as the *Manchester Guardian* calls them. That valiant

but most sober protagonist of Liberalism indicted a scathing leader on these kidgloved secessionists in its issue of the 2nd Instant, from which it may not be uninteresting to reproduce the following extract: "The only serious force behind the rebel leaders is the anti-human force of the few thousands of unhappy roughs who are kept so drunk with the party spite and "religious" hatred that they break out on the least encouragements, in attempts at faction murder. Apart from this force the Ulster army of resistance to Home Rule is a bluff on a poor hand. There is no such force in Ireland as the rebels boast of having enlisted." None whatever, albeit the flaming telegrams which Reuter has been flashing all over the world. There may be a mile long of desks where 500 people and more can simultaneously sign the parchment of this pseudo-covenant of the opening century and there may be 500,000 to sign them, if ever so much. What then? "If they do," says the *Guardian*, "they will be like Falstaff's men in buckram, for there possibly cannot be more than 150,000 adult male Unionists in Ulster. Even of these a great many would not think of signing. Outside the ranks of the wild shouters, Unionism in Ulster is fast losing ground to Protestant Liberalism or Nationalism." More. An Ulster Presbyterian writing to the *Times* observes that "Protestant Ulster does not stand behind the movement led by Sir Edward Carson. There is a considerable proportion of her citizens who will decline to follow his leadership and will not sign his 'covenant.' Not half of our Ministers or people approve of the movement." Of course not. But we shall soon hear of many "stirring" events during the next few days. When, however, the momentary sensation has subsided it will be seen clear as the noon day sun that there is nothing more substantial than the thrice blessed bluff of the kidgloved anarchists at the bottom. It remains to be seen how the "sober and God-fearing" of the Carson

legion are forthcoming prepared to lay down their lives in the 'holy' cause of resistance to Home Rule. So also "the army of merchants, deacons and pillars of rural society with Bible in one hand and German rifles in the other" Scathingly and scornfully does our Manchester contemporary conclude its observations:—"Any physical force exerted on Ulster against Home Rule will be exerted by the familiar Belfast Hoehgan, and the stimulants offered to savagery by the trained forensic talents of the Carsons, Smiths, and Campbells will mainly go to produce cowardly assaults on isolated Home Rulers in quiet corners." Exactly. The Neo-covenanters have now established their camp. It will soon be in full swing. And no doubt the world of wisdom and sobriety will have some amusement as soon as the drama opens and develops itself. What a commentary, however, is this all on the boasted civilisation of our Twentieth Century! And what the cold verdict of the unbiased historian will be a hundred years hence. So much for party strife and cursed party spite. Great Britain needs to be ashamed of these false "patriots" and pseudo-religious politicians of the hour.

CONTINENTAL POLITICS

Politics in the Continent were a little more lively than the month before. The Kaiser, of course, is always in evidence. He cannot move, live, and have his being, wherever he be, without his customary, if not "blazing," indiscretion. There is invariably something dramatic, something sensational about his ways of doing and speaking. Aye, even he goes out of his way to perform some stagery things which may remotely bear on foreign politics, the under current of which is too palpable not to be easily discerned. It is the Germanic boast of superiority. The German is attitudinising the Roman. Roman valour may be there but not the Roman dignity, Roman stateliness and Roman statesmanship. So, Emperor William may pose as much as he likes

as Caesar. He can never be the great Dictator that Cæsar was, the *facile princeps* of all the Cæsars put together. Who does not recollect the attitudinisation of the Emperor Napoleon III, he of Brummagem notoriety and tinsel fame? Who does not recall to memory his annual New Year's-day speech at the Tuilleries and the deliberately mysterious tone he adopted while giving what he presumed to fancy were great utterances beyond all compare with those of the sterling Cæsar himself! How all Continent breathlessly awaited on the utterances falling from his lips breathing peace or war! And how utterly vacuous were they generally proved by the irony of facts. So it is with William II, Emperor of Germany, by the Grace of God. God save the German people!

The next august personage who made some noise on the continental stage was Mon. Berchtold, the Austrian Premier. He sent round a kind of nebulous circular to the Great Powers to confer on something connected with Italy and Turkey. What was in his inner mind is not yet divulged. But the Great Powers viewed askance at the circular of the Minister who aped the diplomacy of his astute predecessor in the Austrian Foreign Office. So that, Mon. Berchtold's circular has proved abortive. It is buried.

Meanwhile it was announced in authority that the plenipotentiaries on behalf of the Italian and Turkish Governments had met in Switzerland—a neutral and disinterested country—to thresh out the preliminaries of peace for which both Powers yearn but which both from false sentiments cannot patch up. Without in any manner accepting the apocryphal statement about an indemnification by Italy to Turkey, for the acquisition of Tripoli, by the large *batzash* of 20 millions sterling, a sum very difficult for a poor country like Italy to borrow or raise, it may be observed that the tired belligerents must sooner or later sign a truce, each swallowing its own bitter pill of prestige however sugar coated. Italy is fed on flashing reports of

victorious troops here and there, in front and in hinterland, while her treasury has a leaking bottom which will need all the retrenchment and economy possible in administration to repair, besides imposition of heavy taxation. Only the Minister in charge of the War Office is hoping against hope for a "dashing" victory which might prove a real golden bridge whereon to retire "with honour."

If Turkey gets out from this lamentable mess of Italian aggression, she would do wisely and well with the Ministry now in power to systematically overhaul the entire system of administration. The Turk is a personage with certain high virtues. At the same time internal dissensions and corruptions so long have greatly enfeebled his morale. But in an administration purporting to be fairly efficient, unless there is a certain element of morale there never can be any hope of firmly grasping the helm of the State bark. But we read already that the present Ministry is determined to do important things; to quell internal dissensions and allay all inter-provincial animosities and jealousies; and, secondly, to re-construct on a solid basis the entire administration, specially finance which in any country must be its backbone of power and progress. The Turkish Premier has already invited capable organisers from England to administer the departments of finance and justice, education and police. That is certainly a wise step in the right direction. And if he can allay all irritation and bad blood in Albania and Macedonia and adopt, as he is determined to adopt, a generous policy of conciliation, co-operation and partial autonomy in the hot-headed Balkans, Turkey bids fair to be on the highway to reform. It is to be devoutly wished that the present Ministry may have a long spell of power so as to be able to achieve the progress now so badly wanted.

Affairs in the Finland province of Russia needs to be closely watched. Russia, as is known, is

gradually depriving the brave and independent Finns of their former freedom so as eventually to reduce them to the same kind of servitude as the other provinces. A serious danger is apprehended by some farsighted European politicians that in the new policy adopted towards Finland by Russia during the last few years, there is the subterranean move to eventually absorb Sweden, the acquisition of which will give her that outlet to the sea for which she has been yearning for a century and more. The menace remains concealed but there may be fat any day in the fire of Continental politics. That will be Russia's golden opportunity to absorb Sweden. But the presence in the Baltic of two navies of two of the greatest military powers would be a distinct signal of alarm to Great Britain in the North Sea. There are dire potentialities and contingencies in this direction too awful to contemplate. On the other hand the Mongolian problem of the near future should not be lost sight of. It is evidently dependent on England's immediate behaviour in Persia and Tibet. Altogether when we come seriously to take survey of the Central Asian question of the future we feel staggered at what the consequences may be of a certain line of policy which England may adopt. God save England!

UNHAPPY PERSIA.

Affairs in Persia could not have been worse. Judging from the latest accounts in Tabriz and from the remarkable letters of Mr. Mason, which have appeared in the *Manchester Guardian*, it is evident that Russia has got Sir Edward Grey completely in her iron grip and that short-sighted and feeble Foreign Minister yet seems incapable of discovering how fast he is plunging his country in the direst of dire dilemmas. He is really a captive in the hand of Russia which overtly and covertly flouts at England's Persian policy as defined in that worthless Anglo-Russian Convention and every day makes her grip tighter and tighter on poor and unhappy Persia who is never allowed

a single chance to regenerate herself. In every direction she thwarts that unhappy country. She has successfully barred Persia by her underground intrigues from obtaining any big loans whatever. The Gendarmerie is yet far from strong. No wonder it cannot be strengthened without the necessary resources. So anarchy has grown chronic. But Russia wants anarchy and is doing her best in order to partition Persia with England. Indeed if the *Manchester Guardian's* authority is to be accepted, and there is no reason why it should not be, as we write intrigues are going forward which would soon culminate into that unhappy condition for poor Persia. The world will look with horror at this unholy partition, if it becomes a reality, but it will be powerless to annul it. And there is no doubt that with that partition England will be a negligible power, for her old enemy will have completely hypnotised and subjugated her to her own strong will. It is to be fervently wished such a disastrous denouement may remain unaccomplished and that England might be spared the humiliation of being completely a tool in the hands of that calculating Power. For with the partition of Persia England's prestige as a first class power will be at an end and the decline and fall of the British Empire will begin. Heaven save England from this disaster!

Initials Only. By Anna Katherine Green
(George Bell & Sons)

This is a detective story in which the criminal is represented, contrary to the usual practice, as cleverer than the detective. The story is of some interest but the plot is unnecessarily drawn out and the interest is not kept up throughout. An additional element of interest is added to the story by making the Hero an aviator. On the whole the novel comes up more or less to the average of detective novels and the author has not flinched from a tragic ending of the story.

THE WORLD OF BOOKS.

[Short Notices only appear in this section.]

A First Book of English Literature. By Henry S. Pancoast and Percy Van Dyle Shelly.
(G. Bell and Sons)

In spite of the numerous available manuals on the History of English Literature, it has always been a somewhat difficult task to get a readable and comprehensive text-book for class use. Messrs. Bell and Sons have supplied a real want by this volume. There is an effective blending of the biographical and literary interest and the authors have also freed the volume of the heavy appendages so usual in such manuals. We desire to notice for special appreciation the lucid analysis of the genius and achievement of individual writers. Attention has also been paid to the inter-dependence of their lives on social and political conditions, and the historical aspect is brought out at the commencement of each great literary epoch. The excellent illustrations enhance the value of the book.

Speeches and Writings of V. R. Gandhi,
B.A., M.R.A.S. By Bhagubhai F. Karbhari, Editor,
the Jain, and the Patriot, Bombay, published
by Tripathy & Co., Bombay. Price Rs 1-8.

Mr. Gandhi was the delegate to the Chicago Parliament of Religions, representing the Jain Community and Philosophy, and the present work is the first volume of the speeches and essays by him published in a collected form. Jainism is strongly allied to Buddhism and is as old as the latter in India. It survives in India mostly on the Bombay side, and its votaries are healthy, pious, and charitable. A study of the papers collected herein conveys the impression that the Jain Philosophy is not quite correctly understood by even the best philosophers of the other better-known schools. Mr. Karbhari has done well in placing before the public the views of so able an exponent as the late Mr. Gandhi.

Essentials of Psychology. By S. Radhakrishnan, M.A., Assistant Professor of Philosophy, Presidency College, Madras. (Oxford University Press).

This little book is, as the author says in his preface, "an attempt to present in a simple and clear way the essential principles of psychology", and is the outcome of a course of lectures delivered to university students. In so small a compass it is obviously impossible for a book to deal with all the questions that a large manual of psychology might be expected to treat, nor is anything very original to be looked for; within its self-imposed limits the book succeeds as well as any of the smaller handbooks we have seen, and it should prove valuable as an introduction for those who are thinking of making a serious study of the subject. The ground is well traversed, and leading psychological theories are passed in review and subjected to appropriate and up-to-date criticism, while at the same time the book does not fall under the curse of some larger treatises in merely criticising and giving no clear guidance of its own. Especially admirable is the emphasis on the fact that the various elements which are looked at in comparative isolation for purposes of abstract discussion are linked indissolubly together in the living man. Even so short a book would have been the better if, in addition to its excellent table of contents, it had had an index, and, even more important for a book that professes to be an introduction to its subject, a bibliography.

The Foundations of Science. By W. C. D. Whetham, F. R. S., T. C. & E. C. Jack, London.

This gives a brief sketch of the development of various sciences without going into the details of any one of them. This must form a good introduction to those special books on the history of the development of the sciences. The author's allegory on the classification of the sciences is very apt.

Diary of the Month, Aug—September 1912.

—:—

August 23. It has been decided to present a public address to Mr. K. B. Dutt, Counsel for plaintiff in the Midnapur case in recognition of his self-sacrificing services.

August 24. A prolonged earthquake of some severity is reported to have occurred early this morning at various places in the North-West Frontier Provinces, the shock being particularly severe at Peshawar.

August 25. At a meeting of Mahomedans held this evening in Calcutta under the auspices of the Bengal Provincial Mahomedan Educational Conference, a resolution was adopted protesting against the decision of the Government of India as regarding the Muslim University.

August 26. H. R. H. Prince Arthur of Connaught and Mission left London for Tokio to-day to represent King George at the funeral of the late Emperor of Japan.

August 27. A hundred Mahomedan Zemindars of the Larkhana District at a meeting in Karachi to-day declared themselves in favour of the Education Cess Bill.

August 28. A public meeting was held in Calcutta to express regret at the death of Mr. A. O. Hume, with Dr. Rash Behari Ghose in the chair.

August 29. H. E. Sir George Clarke in opening the Bombay Provincial Co-operative Conference to-day delivered an important speech in the Poona Council Hall.

August 30. Sir James and Lady Meston have left for India via Brindisi.

August 31. A Public Meeting will be held at the Town Hall, Calcutta to consider what steps should be taken in connection with the decision of the Appellate Court in the Midnapore Jamage suit, and to emphasise the necessity for the separation of Executive and Judicial functions.

September 1. Information has been received at Poona that Mr. Gokhale's appointment to the Public Service Commission is not to be allowed to interfere with the carrying out of his intention to stand for re election to the Imperial Legislative Council

September 2 The name of Sir Richard Lamb is mentioned in connection with the acting appointment of Governor of Bombay during the interval between the departure of Sir George Clarke and the arrival of his successor

September 3 The Hindu University Deputation arrived at Kotah and waited on H. H. Maharao Umedsinghji Bahadur when His Highness paid a handsome donation of one lakh of rupees

September 4 H. M. the King received Lord Pentland in audience and conferred on him the Insignia of the Grand Commandership of the Order of the Indian Empire.

September 5 H. E. Sir George Clarke this evening opened the N. M. Wadia Amphitheatre as part of the Ferguson College, Poona.

September 6 The death is announced of General Sir Charles Gough, the Mutiny Veteran.

September 7. The programme for the meeting of the Imperial Legislative Council fixed for the 10th inst., was formally settled this evening.

September 8 It is reported that a widespread Military revolt has broken in Yunnan and that a general panic and lawlessness are threatening the district

September 9. The Chief Commissioner of Gauhati held an Educational Conference to day, in which it was settled to build a Mahomedan hostel and hospital attached to the Cotton College.

September 10 The first meeting of the autumn Session of the Imperial Legislative Council was held this morning at the Viceregal Lodge, H. E. the Viceroy presided Messrs Howard, Nethersole, Michael, Maxwell, Halley and Colonel Holloway were sworn in as Members

September 11. In the general meeting of the Poona Municipality to-day it was resolved to give a fitting farewell address to the Governor. A committee was formed and Rs. 500 voted for the purpose.

September 12 The Parsee New Year's day is being celebrated with much eclat in Bombay. This is the 1250th year of their settlement in India.

September 13. Dr. Sarvadhikary has been appointed a member of the permanent Executive of the International Moral Education Congress at The Hague

September 14 Mr K. B. Dutt replying to the letter of the president of the recent Town Hall Meeting at Calcutta has declined to accept the public address.

September 15. This afternoon Hon. Sir James Meston, K. O. S. I. received charge of the Office of the Lieut. Governor, United Provinces of Agra and Oudh, from Hon. Sir John Hewett.

September 16 H. H. the Nizam and staff arrived to day at the Viceregal Lodge as the guests of their Excellencies the Viceroy and Lady Hardinge.

September 17 H. E. the Governor of Bombay visited the School of Arts to-day when the elaborate and beautiful models of the Arch to commemorate the landing of Their Majesties was exhibited.

September 18. There was a lively debate in the Bombay Municipal Meeting to-day when Dr. Master moved that the principle of bringing out European officers without openly inviting applications is dangerous.

September 19. The Standing Committee of the Bengal Provincial Conference has submitted a lengthy representation to H. E. the Governor suggesting alterations in the regulations affecting representation in the Councils.

September 20 Mr. C. H. Bompas, President of the Calcutta Improvement Trust, read a paper on "City Improvement" to the members of the Social Study Society this evening.

TOPICS FROM PERIODICALS.

Aesthetic side of School Life.

Civilization in the Mahabharata Period.

"Historicus" writing in a recent number of *The Vedic Magazine* compares and contrasts, with ample texts from the original authorities, the civilizations of the Ramayana and the Mahabharata periods in the history of India. He says that in the Ramayana period, the Brahmanic element was predominant in national life and consequently the pursuit of luxuries and sensuous delights was looked down upon. In the Ramayana itself we read that Vashishta and Vishwamitra had the supreme, and almost determining share in the direction of public affairs. Their towering personalities always loomed large on the public mind. Even the King had to obey their behests or at any rate to show marked deference to their sentiments. This is illustrated by several citations from Valmiki. The whole atmosphere in every aspect of the national life was spiritualized. And the word of the Brahmin sage was the law of the age. The result of this spiritualization of all national activities was that even after conquering Ceylon Rama refused to add it to his dominions but left it entirely in charge of Ravana's brother.

But the case is different in the Mahabharata period. Military conquest and Military pride were the ruling passion of the age.

In the Mahabharata period, on the contrary, the Aryas had departed from their lofty ideals and as a result of the lust of conquest and pride of territorial aggrandisement wallowed in sensual luxury. The result was that the life of luxury bred vices, vices led to the deterioration of national character, the deterioration of national character resulted in the establishment of the dominion of selfishness, selfishness gave rise to internecine warfare, and internecine warfare caused a catastrophe from the effects of which India has not yet recovered even after the lapse of five thousand years.

It was but natural that in a society interpenetrated with materialism and dominated by materialistic tendencies the Brahmins, the representatives of asceticism, self-abnegation, self denial and honourable poverty, should have been looked down upon with scorn and contempt.

Mr. P. C. Bannerji's short and interesting article in the latest number of the *Indian Education* is a plea for aesthetic training for school boys. There is indeed no denying, that there is very little done in our schools to cultivate the aesthetic side of the school going boys.

I am not talking here of the want of training in our schools of the feelings of sympathy, self-sacrifice, charity, &c., which are included in moral training and which also receive very little attention, but only of the pleasure felt from a certain combination which is designated beauty in objects, and harmony in sounds, and which is a powerful means of raising our natures. In other words, I am talking of the utility of having not only the grammarian, the mathematician, the historian, the geographer, the scientist as the teachers of our boys, but also of the painter, the sculptor, the carver, the photographer, the poet and the musician being given a due place in the school pantheon of teachers.

It is understood that music is taught in English schools and that it forms a part of the curriculum in the continental universities. It is a sad want in Indian Schools. The writer urges that though it could be found impracticable to teach Indian music to school children, the occasion of a marriage in the headmaster's family, the inspector's visit or some grand festival like the coronation day should be availed of for making the boys sing their odes to the tune of Indian music. Perhaps this is done in some village schools in these days. The writer also suggests another method of aesthetic training. He writes:—

There may be some flower pots in the school verandah, surely at least in the school Boarding House, and these may be put in the charge of boys who will take care of these, and who will like this occupation, and will be greatly pleased when the plants they have tended begin to flower. They will also lay by a stock of useful information about these plants.

He then insists on the necessity of the habit of cleanliness both in the attire of the children and in their books and note books. Above all the teacher must set the example.

Teachers are generally capable of forgetting to shave their beards regularly for want of time and this, as somebody humorously said gives them the appearance of a criminal. Why should not they sometimes please themselves and the class by having
vers ?

The Futility of Parliamentary Oratory.

In an article in the latest number of *The Chamber's Journal* Mr. Michael MacDonagh discusses whether votes in Parliament are swayed and determined by oratory and argument. He concedes that the intellectual charm of an eloquent speech makes a universal appeal. He is not, however, disposed to believe that the weight of debate decides the issue of political controversies. Especially in the House of Commons in which the members have definite and fixed opinions and are rigidly divided into highly organised parties, speeches however fine, in truth seldom, if ever, turn a single vote on political issues.

The writer illustrates the effect produced by great oratorical performances in the House. Macaulay's celebrated speech on the Copyright Act was productive of immediate success. Lord Palmerston's wonderful feat in the House with his electrifying peroration was a first rate performance and averted the verdict of his worst enemies. Gladstone was often enwrapped in a tragic splendour as he spoke and for a time stood the veritable oratorical embodiment of Ireland's anguish and aspiration. And who does not know Sir Henry Fowler's moving eloquence to the patriotism of the Home.

'Every member of this House is a member for India,' said he. All the interests of India, personal, political, commercial, financial and social, are committed to the individual and collective responsibility of the House of Commons. 'Ask the House to discharge that gigantic trust unimpaired by any selfish or party feeling, but with wisdom and justice and generosity.' So powerful was the speech that Mr. Goschen, who was on that occasion leading the Opposition, proclaimed himself on the side of the Minister, and the day was won for the Government.

Indeed under a democratic form of Government eloquence must always be a power. On occasions of great controversy the orator wields exceptional influence. The writer concludes.—

But we get in the parliamentary debates the ablest exposition of the merits and defects of the current political questions of the hour in the light of Liberal, Conservative, Nationalist and Labour principles. If these discussions have little or no effect in the division-lobbies, they compel thought, and that is greatly to the good.

Material and Intellectual Development.

Fred Longfien, a Socialist writer contributes to the current number of *The Socialist Review* a short paper on the above subject. It must be accepted as an axiomatic truth that the intellectual and moral state of a people is the surest index to a people's greatness. The realization of such a mental condition depends almost wholly on material progress in one form or another. The writer illustrates how far this observation is true.

Anybody with the least pretensions to a knowledge of ancient history will readily concede that wealth was the cause of the fall of Rome.

Rome fell, then, through the minds of its governors being adversely affected by the monopoly of the fruits of material progress.

The writer shows that if wealth was not monopolised by the few but more evenly spread the situation would have been different. He deplors that a similar condition prevails in modern Europe.

Again there is another evil arising from the material progress as obtained under the abnormal conditions of modern civilization. Owing to greater intensity of competition manufacturers are stooping to unfair methods of industry. The diabolical uses to which the "principle of substitution" is applied have made many necessities of life perfectly unwholesome and harmful to consumers.

Material progress among the very poor classes, the writer believes, would ensure greater moral and intellectual development. Healthier workshop conditions must lead to intellectual and moral betterment. In brief the grades of human culture seem to point to the theory that moral and intellectual development largely depends on material opportunities.

But I do not, of course, mean to say that all persons who have the higher incomes must possess greater mental and moral qualifications than those who receive lower incomes. What I do suggest is that one who has a fair amount of buying power can afford to purchase the means by which one's mind may be developed. One may buy books, facilities for travel, wider chances for study and observation, home comforts, and so on, all of which tend to broaden one's mental outlook to the extent of one's capacity to receive knowledge.

Primary Education.

The current number of the *Dawn Magazine* contains an important paper on "The Problem of Primary Education in India: Its two-fold character." The writer begins with a quotation from Mr. Philip H. Wicksteed's recently published paper on Education in the Village. Mr. Wicksteed says in his pamphlet that the general outcome of the hours spent in the village school is, in a lamentable number of cases to detach the children from the healthy love of country-life, from its educational influences, to give them a distaste for country industries and to direct their ambitions and aspirations into wholly other channels. This being so, the one thing, continues the writer, is to bring the instruction in the school into relation with the actual and practical life.

Again, it appears that the question of primary education in the village has to be viewed also from the purely educational standpoint. At the present day the distaste for rural life and rural occupations is absolutely detrimental to the character of the children. Apart from the mere development of the intelligence and ability of the boys, the character side of the student population is at stake. Mr. Wicksteed describes the situation in the following words:—

The village boys and girls no longer carve bowls and weave good cloth in winter nights made happy with folk-songs and ballads. Their music comes from a gramophone; their songs are imported from the nearest town; their dancing and football they pay for and lazily watch.

In India the conditions have not as yet come to that state. Rather do the villages need a little more of educational institutions. But then we ought not to forget the dangers of the system that forgets the character aspect of culture. The two things necessary for Indian life are therefore:—

(1) To develop intelligence in village population to enable them to cope with the conditions of modern life; and (2) not to undermine, but to strengthen the forces that have gone to build up and develop the character-side of the village populations of India.

Education in India.

In a recent number of the *Westminster Gazette* appeared an article on the above subject which has attracted considerable attention in England. The writer begins by saying that the problem of education in this country is not quite as smooth a thing as it is elsewhere in the world. He says that the task of educating all India is too immense and too impossible even with the entire resources of England and India combined. It is therefore necessary to supplement the finances of the Indian bureaucracy with some private funds, for which the aid of private charity and philanthropy must be had recourse to. The despatch of 1854, he says, laid down three main principles for future guidance. They are:—

First, education should be practical, to "make those who possess it more useful members of society;" second, to encourage the grant-in-aid and liberality from every quarter, third, whilst recognising that Government schools should be secular, it desires, through grant-in-aid, to encourage religious instruction wherever possible.

The writer complains that had these principles been carried out, Indian education would have been a much brighter chapter in the history of British rule in Hindustan than has unfortunately been the case. But the officials of the Education Department in India have thwarted the policy of the Government. They have made the blunder of regarding the enterprises of private institutions as rivals to those of the state. "And thus education has rarely been practical but usually clerical and literary only." The Commission of 1882-3. recorded:—

We recommend that while existing State institutions of the higher order should be maintained in complete efficiency wherever they are necessary, the improvement and extension of privately managed institutions be the principal care of the Department.

The writer concludes:—

To-day a meagre grant, liable to erratic reductions, a fluctuating policy at the mercy of each new departmental director, and a weak inspectorate have tended to reduce Government control over the grant-in-aid, have discouraged Indian and missionary liberality and initiative, and retarded the spread of education.

The Mughal Administration.

The August number of the *Hindustan Review* contains a learned and illuminating review of the Civil Administration of the Mughal Empire by Mr. S. V. Venkateswaran, M. A. The writer begins by saying that the sixteenth century saw the golden age of Mussalman rule in India. Partly owing to the sage counsel of the ministers and partly owing to the loyal devotion of the subjects a sort of homogeneous confederacy and religious coalition were wrought by Akbar amidst all the clashing elements and diverse classes of the population. Still, however, the working of the administration during the reign of Akbar is far from clear. As pointed out by Talboys Wheeler it is hid behind a veil of fulsome flattery. The influence of Luis Boswelliana is rather rampant on the minds of the admirers of Akbar. From a historic survey of the period it is clear that the Emperor was the very centre of the administrative machine. In him, as the writer points out, were combined the supreme conduct of the general administration as well as the supreme legislative and judicial powers. Indeed all the land in the state was the property of the Emperor. "In this way the Empire of Akbar was a despotism; though a despotism tempered by a polite recognition of the rights and prejudices of the subject peoples."

Though virtually the supreme master of the Kingdom the machinery of his Government ought not to be neglected. He had a splendid equipment of officials fitted in an efficient bureaucracy.

The most important officer of the state was the Wazir or Principal Minister. He had charge of the Crown lands and dispensed official patronage. There were four chief officials at the head of the Central Government. 'The four elements of monarchy,' says Abul Fazl are the Dewan or financier, the Commander-in-Chief, the Qazi or Chief Justice and the Intelligencer. There were a number of other officers, in charge of revenue, judicial or administrative work. The Dewan of the salaries was the medieval counterpart of the modern Chancellor of the Exchequer.

So far for the general conduct of the Imperial Government. But it is doubtful whether the local

Government was always efficient enough to suppress the private feuds of clans and Villages. All the same Village administration seems to have been satisfactory in character. The writer proceeds.—

The common affairs of the village were ordered by a council of Elders, five in number known as the Panchayet. 'The municipal and village institutions of India,' says Malcolm, 'were competent, from the power given them by the common consent of all ranks to maintain order and peace within their respective circles. In Central India, their rights and privileges never were contested even by tyrants, while all just princes founded their chief reputation and claim to popularity on attention to them'. The panchayets not only taught the people the benefits of collective action and of subordination to just authority, but they also maintained local order, secured safety of life, ensured the fair dealings of villages with each other and vindicated private character, under the single sanction of social ex-communication or public obloquy. There was a nice division of functions among these executive officers, both in Northern and in Southern India. But it is not necessary to go into the details of the village administration, it remained much the same as in the old Hindu times. In fact, 'the Muhammadan conquerors never succeeded in really forcing their system on the races of India.'

Even the methods of civil and criminal procedure seems to have been the same as in previous times. When a civil claim was proved, the person who gained the suit got hold of the property in dispute. If the plaintiff lost his cause he had to pay double the sum he had sued for. As in older times, resort was had to the ordeal whenever the judge could not give a decision even after examining witnesses. And the punishments varied according to the distinctions of caste and creed quite as in Ancient India. In most cases the penalty was indeed severe but we must remember the crudeness of the age and the normal standard of contemporary civilization. But one thing is clear beyond doubt. The people obtained speedy justice and the tedium and expense of modern legal machinery with scarcely any greater advantages in the discovery of justice was entirely absent. And it is satisfactory to note that so few were the cases brought for decision that only one day in the week set apart for the administration of justice sufficed the Kingdom. It speaks volumes of the law-abiding character of the people.

Social Reform in India.

The *New Monthly* for the current month contains an article on the much debated question of the two methods of Social reform in India. Mr. S. P. Vijayaraghava Chari, the writer of the article, says that the question of Social reform has been in existence for the last quarter of a century in India and yet no tangible result has as yet accrued from it. There has been a quarrel as to the best mode of effecting it. Now its necessity has been fully accepted and enforced by some who have been trained and educated on Western lines of thought. But even among them there is no harmony or uniformity; difference of opinion has arisen from the very first beginning as to the methods. Here are the two methods of carrying out reform.

One school argues that reform should be carried out on rationalistic principles. It wants to obey the dictates of the Science of Sociology. Every society makes laws and enactments according to the stage of evolution and the phase of environment in which it has been driven to maintain itself. As evolution advances, new and different phases of environment present themselves and it is the duty of every society to adapt itself to the new requirements but should not cling itself to the old methods and observances. Otherwise its progress will be impeded and its vitality will dwindle into insignificance. This school might be called the rationalistic or the scientific. The other school might be called the orthodox or the Shastric school. It contends that many loose signs of the unique and fundamental characteristics of Hindu society, its evolution has not been on the general principles of evolution, struggle for existence and struggle for the life of others. Its whole tendency has been in its course of evolution towards a struggle to preserve and a stubborn adherence to Shastras, which it considers as a sort of revelation. Shastras are a set of maxims for social guidance which have been arrived at when a remote ancestor of it was in its glory and refinement and environment was most favourable to a practical realisation of those maxims. Hence, when any reform is to be carried out, the method chosen should be such as to fully accord with its natural tendency from which so much ignorant and obstinate opposition arises as soon as we talk of reform. The method to be pursued should also be Shastric.

It is contended that the various laws and rules of conduct as observed to-day in the different walks of life have a Shastric basis; but it is faint and illogical. And the true spirit of the Shastras

and the goal which they aimed at have been entirely lost sight of by narrow-minded interpretations, prejudice, misguided energy and foreign contact. The writer exemplifies this statement with a reference to the custom of consulting the horoscopes of bachelors and maids.

I do not like to go so far as some do by hinting that Astrology is a myth, but I shall grant it as an empirical science with generally some workable hypotheses and data. Its warning note is attended to most carefully, though in some cases sentiment or some other motive, or worldly consideration tries its best to pay less heed to the warning note of science. Some of the boys' horoscopes are credited with single wife or two or three wives, while in the cases of girls the so-called expounders of the science never mention any such facts but maintain a golden silence. Now the suspicion naturally arises whether a science can be so partial or whether it is the mischief of the so-called expounders of the science. Whether the science is applicable to the Brahmin community alone by dictating a marriageable age limit to girls alone, or whether it is not applicable to other communities where there is no dictum of age-limit, whether it is applicable to the widower alone by giving him full freedom to marry again and again or is it not applicable to widows because there is restriction imposed on them? I am led to believe from reliable sources that it is an empirical science and Hindus folly believe it as a science. And as a science it should be impartial and universal. Hence I should think that the social customs now in practice are quite antagonistic to the teachings of a science which is completely believed to be a science and a Shastra by the whole country.

The writer then questions the legitimacy of the age limit in the matter of marriage of girls and attacks the meaningless and insincere advocacy of orthodoxy by those who have abandoned every form of Shastric conduct in daily life. He concludes —

The policy of the Rationalistic school will arouse the greatest opposition and if it seeks the help of Government, of course there would arise chances for a revolution, as the *Madras Mail* recently observed. Reform should come from within; and the policy of the Shastric school can move smoothly and in course of time greater probabilities may arise for reform to come from within. The policy of the organisers of the *Conjagaram Parishad of Pundits* was a move in the right direction. A greater frequency of meeting of such Parishads will conduce to greater enlightenment and study of the problems. The suggestions recently made by the Hon'ble Mr. Justice Sadasiva Iyer as President of the Social Conference deserve our best attention. And I pray for the success of the Shastric school of reformers and I hope that ere long we may have tangible results achieved in our society.

Spiritual Mysticism.

In the current issue of *The Modern Review* there is an entertaining article on "The Permanent Value of Spiritual Mysticism." Mr. Ajit Kumar Chackravarty begins by saying that there is to day in Europe a growing tendency to mysticism and to the interpretation of mystical experiences. Mysticism claims the possibility of a direct communion with the ultimate Being and it is thought that the processes of that supersensuous achievement throw a new light on the problems of psychology and religion. Mysticism again is generally supposed to be illogical but for that reason it ought not to be condemned as absolutely irrational since it is founded on the deepest psychical experiences of man which cannot be easily dismissed as unreal and fantastic. Nor is it a vague emotionalism. For we see that philosophers and scientists alike are tending to it even as the artists and poets to get beyond an intellectual idealism. Both Prof. Eucken and Prof. Bergson who may be said to lead the philosophical thought of Europe to-day believe that psychical experiences lead as a stepping stone to spiritual realization.

It would not be true to say that mysticism is of purely Eastern origin and that the West is utterly incapable of it. But the heart of mysticism is in the East.

I have said that mysticism is the dominant note in European thought to-day, but I have not said that it has its hidden source in the perennial fountains of Indian religions and thought-systems. I do not take the burden of proof on me, but my conviction is that the new Theology movement, the Pragmatic and Humanist movement, and the new movement of Bergsonian Intuitionism, all of them, though not originating from the East, are being secretly and unconsciously fed and nourished by Hindu spiritual culture. And I believe that the day is not very far, when the meeting points of the two streams of thought, one running in the West, and the other in the East, will loom above mankind's thought-horizon. To the Hindu people, mysticism is the timeless temple wherein one may receive direct evidence of inexpressibly sacred import. And it is sought also than that internal evidence which exists only in the rapt union of subject and object.

The writer demonstrates that Mysticism is the dominant note in the thought alike of the East and the West. Mysticism, he says, is nothing but the making of the conditions of God-realization, and that the art, poetry, philosophy and science of this age are all working to build up this new faith on earth.

Hinduism and Material Progress.

Dr. Sir S. Subrahmanya Aiyar, LL. D., Kt., C. I. E., in his excellent summary of the causes that contribute to the backward state of material progress in India observes in the latest issue of the *Wealth of India* :—

There is, first, a certain want of enterprise in the people, which is due, not to any intrinsic defects of theirs but to their isolation and political conditions in the past. There is unfortunately also great lack of habits necessary for successful enterprise such as accuracy, punctuality, persistent pursuit of the object in view, ascribable, I believe, to the easy life, attended by few wants, hitherto led by the people and, in a way, tolerated, if not favoured, by the climate. Even a greater cause is the entire absence, till now, of facilities for instruction and training, indispensable to the acquirement of the requisite capacity for carrying on commercial or industrial undertakings on any extensive scale. It is clear, however, that the existing state of things cannot last long. The most hopeful sign of this is the success which has, within so short a time attended the co-operative movement and that, with reference to the strata of society, practically untouched by education. Doubtless, with the spread of the potent force of education, which may now be taken as assured, having regard to the recent Imperial pronouncements on the subject and to the policy adopted by the Government in consequence as well as with the growth, of the new spirit which is manifesting itself everywhere, material progress in the future is bound to be far quicker than hitherto.

The learned writer concludes that the day of individualism and socialism are closing and that it is time for collectivism to triumph. But the success of collectivism depends on the amount of self sacrifice and renunciation which the higher ranks of society will bring to bear on the carrying out of the experiment.

That alone will constitute the genuine socialism, the one contemplated by the Varnasrama Dharma or the social polity of the Manu of our race. This, the future Manu, is also expected to carry out with modifications and improvements. May the success hoped for with reference to such an experiment attend humanity as a whole, must be the earnest wish of all who are watching the progress of events in the West even at the present time.

The Education of a Businessman.

A writer in the July number of the *Journal of the Maha Bodhi Society* insists upon the necessity of imparting Higher Commercial Education in the Universities of India. After adequately imparting general education which must be the basis for all special scientific instructions the Eastern Universities must also undertake to give the students the advantages of business-training which are invariably obtained in the celebrated academies of Europe and America. In these days when so much is made of the need for religious and moral instruction the writer puts in a plea for imparting commercial methods.

When it is said that liberal education must be supplemented by religious and moral instruction, why should there be a void of a business training in the curriculum of our colleges? He instances the case of the London School of Economics. Of course the writer does not say that we require the same courses that are prescribed in the West. There the operations of commerce and instructions are extremely varied and complex. But for us, he says, a modest scheme of commerce study will do.

He says.

Opinions will most probably differ as to the minimum training which it is desirable that Indians should undergo preparatory to going into business. But it would not be difficult to lay down a satisfactory course of studies spread over a period of four years, the time it takes now for a matriculated student to attain the Bachelor's degree in either Arts, Science, Law or Civil Engineering. The subjects would be (1) A modern European language besides English (preferably German), (2) the Principles of Economics, (3) Commercial Mathematics, Accounting and Auditing, (4) Banking, the Money Market and Foreign Exchanges, (5) Outlines of the General History, and a more detailed History of the growth of commerce and industry in the principal countries of the world, (6) the Geography of the world with a knowledge of the areas of production, trade-routes, etc. (7) Statistics, trade returns and reports, (8) Mercantile Law and Practice. A few of these would be optional in the case of students who looked forward to occupying themselves with local industries, these would take as alternative subjects Physics and Chemistry, Industrial Law, and the like.

Emigration from India.

This is the subject of an article in the August number of *The Modern World*, by Mr. Sridhar V. Ketkar. The writer has freely made use of the papers on "The History of the East Indian Immigrants" contributed by Mr. Allynne Ireland under the signature of Langton to *Argosy*, a journal published in Georgetown, British Guiana. Mr. Langton devoted his papers to the inquiry whether the coolies received any ill-treatment at all. But Mr. Ketkar gives in his article a more detailed account on the various aspects of the question of Emigration based on several other sources besides the contributions of Langton. On the origin of Indian labour in Guiana the writer says —

When the apprenticeship law reduced the hours of labour from nine to seven and a half per diem they began to look about the world for people willing to perform the remaining sixth part of work. As early as February 1831 an attempt was made to import German coolies. The first Portuguese immigrants from Madiera were introduced during the same year. The first vessel loaded with Indian coolies from Calcutta was the *Hesperus* which brought over 156 coolies on May 5th, 1838. Still, the planters in the colonies during this period did not feel so greatly anxious to induce foreign immigration as they did after the slavery was abolished and the effects of the abolition began to be felt in the labour market of the colony.

It may be asked why the planters in British Guiana should take it into their heads to bring the labourers from so distant a country as India and under great responsibilities. The principal cause of it is that labour is so cheap in India. But it has been found that of late the task of bringing the workmen from India, and other extra expenses rise to a high level. And yet Indian Emigration is so common. The reason that all those parts which had been supplying the country with cheap labour have now discontinued the emigration of workmen by levying a heavy tax on them. So much so that in spite of the heavy expense and responsibilities, the planters look to Madras and Calcutta to recruit the labour which they require.

QUESTIONS OF IMPORTANCE

Proposed Universities of Aligarh and Benares.

Sir Harcourt Butler has issued the following letter on the subject of the proposed Universities of Aligarh and Benares:

To the Hon'ble Raja Sir Mahammad Ali Mahammad Khan, Khan Bahadur, of Mahmoodabad, K. C. I. E.

Dated the 10th August, 1912.

Dear Raja Sahib,

I am in a position to communicate to you the decisions of His Majesty's Secretary of State, in regard to the proposed University of Aligarh. You will remember that the movement was started without any reference to the Government. Not until May 1911 did a committee consisting of Nawab Mastaj Hussain, Mr. Aflak Ahmad Khan, Dr. Ziauddin and yourself approach me informally. We had some discussion and I said that before going any further the Government of India must obtain the sanction of the Secretary of State in regard to the principle of establishing a University. On the 31st July 1911, I communicated to you the readiness of the Secretary of State to sanction the establishment of a University provided (1) that your committee could show that you have adequate funds in hand for the purpose, and (2) that the constitution of the proposed University was acceptable in all details to the Government of India and himself, added at the end of my letter that the Secretary of State had reserved full discretion in regard to every detail of any scheme which may eventually be laid before him. At that stage no details could be placed before the Secretary of State. The discussions which have taken place between us were conducted on this clear understanding which I more than once repeated. As regards what I may call the external relations of the University His Majesty's Secretary of State has decided, after mature consideration, that the proposed University should not have the powers of affiliation outside the locality in which it may be established. The hope of Sir Syed Ahmed Khan was to convert Aligarh into a teaching and residential University and this hope has repeatedly been expressed since by leading Mahomedans and others connected with the College. In the preamble of the draft constitution prepared by the constitution of the committee it is stated that from the beginning the object of the founder and the Moslem community was to raise such a college to the status of a University.

The practical objection on the educational grounds to affiliation are many. I need only instance the following:—

(1) A University with branches all over India would lead to competition and probable conflict with the other territorial Universities.

(2) Such a University would inevitably keep down the standard of Aligarh degrees and would destroy the hope that the teaching University would become a genuine seat of learning at which examinations would be

subordinate to teaching and teachers would be free to develop the intelligence of the students and not merely exercise their memories.

(3) The value of the residential system depends upon the tone or spirit which pervades the college and handed on from one generation of students to another constituting its tradition and the traditions of Aligarh are quite local and peculiar depending largely on personal association.

(4) The University at Aligarh would be quite unable to control colleges situated in different parts of India. Experience is already demonstrating the inconvenience of existing Universities.

Apart from these practical objections on the general principles of high educational policy it is desirable that the University of Aligarh should be founded in harmony with the best modern opinion of the high road to educational efficiency, that is as a teaching and residential university. The decision of His Majesty's Secretary of State is final and must be accepted as such. The Secretary of State and Government of India recognised that it might be a cause of disappointment to the community, but they trust that it will bring their best interests in the long run. As regards what I may call the internal relation of the proposed University, considerable modification of the proposed constitution will be necessary. The Secretary of State has decided that the Viceroy should not be Chancellor, that the University should elect its own Chancellor and that the powers which it has proposed to vest in the Chancellor should be exercised by the Governor-General in Council, with one exception, namely that the professors should be appointed without the previous approval of the Governor-General in Council. The distribution of powers between the various bodies of the Universities must be subject to future decision. I can only say at present that it is essential that matters relating to curriculum, discipline and examination should be in the hands of educational experts. This is the practice in the English Universities on which the constitution of the proposed University of Aligarh has been based. It has been suggested that some seats in the Council should be reserved for the representatives of the senate. I suggest that with a view to expedition of business and avoidance of misunderstanding the constitution committee should consider the constitution 'de novo' with reference to the main heads of discussion and not with reference to the drafts already prepared. It is desirable to obtain a clear and complete statement of the points in which the conference agree after which the Bill can be remodelled. His Majesty's Secretary of State will reserve his discretion as to the constitution in all details not specifically mentioned in this letter as decided and particularly in regard to the distribution of powers among the component bodies of the University. I am authorized to announce that should the specific sum of thirty lakhs be collected and invested and a constitution be framed satisfactory to the Government of India and the Secretary of State the Government of India will be prepared, in view of their deep interest in the movement, to make liberal annual grant to the University contingent as in the case of grants to Universities in England on the satisfactory results of inspection and audit. In conclusion I must tell you that the Secretary of State has decided that the proposed University should in future be styled the University of Aligarh.

Yours sincerely,
(Sd), Harcourt Butler.

To the Hon. Maharaja Sir Ramenwar Singh Bahadur
of Darbhanga, K. C. I. E.

Dated the 19th August, 1912.

Dear Maharaja Sahib,

The Secretary of State has decided that the proposed Universities of Aligarh and Benares should be called hereafter the University of Aligarh and of Benares respectively and that they should have no powers of affiliation outside those localities in which they may be established. As I informed the committee at Delhi this decision follows the decision in regard to the University of Aligarh. The reasons for it are being published in regard to the Aligarh University and apply "mutatis mutandis" to the Benares University. The decision is final and must be accepted as such. The Secretary of State and the Government of India recognise that it may be a cause of disappointment to the community but they trust that it will be in their best interests in the long run. The committee over which you preside has formulated no definite proposals and it is therefore unnecessary for me to offer any further remarks at present.

Yours sincerely
(Sd) Harcourt Butler

MUSLIM SUB COMMITTEE'S REPLY

The following letter, drafted by a Sub Committee comprising Nawab Mahomed Ishak Khan, the Hon'ble Mr. Shafie, the Hon'ble Nawab Abdul Majid, the Hon'ble Mr. Mozhar ul Haque, Syed Wazir Hussain and Mr. Mahomed Ali, and afterwards adopted by the Aligarh University Constitution Committee in Session at Lucknow, has been sent to Sir Harcourt Butler in reply to the above communication on the subject of the Secretary of State's decision regarding the proposed Aligarh University —

Dear Sir Harcourt Butler — I am thankful to you for the long and detailed letter which you have been good enough to address to me on the subject of the decision of His Majesty's Secretary of State, in regard to the proposed Muslim University. I had your letter before the Muslim University Constitution Committee which met here on the 11th and 12th instant, and the matter dealt with in the letter were most carefully considered by the members who attended in large numbers practically from every part of the country.

Before stating the conclusions at which the Constitution Committee arrived, I consider it necessary to invite your attention to the fact that the scope of my Committee is limited and that it was constituted merely to frame a Constitution for the proposed University, and when considering the letter under reply the Committee was conscious of the fact that it had no authority to go beyond a consideration of the decisions contained in the letter as suggestions for altering the Constitution which it had framed for the University. The decisions of the Secretary of State are entirely opposed to the basic principles on which the promoters of the proposed Muslim University have all along been working, that, apart from the personal inclinations of its members, the

Constitution Committee felt that it had no authority to accept a decision which runs counter to the very principles on which it was asked to frame a Constitution for the University. In view of the extreme seriousness of some of these decisions, the Constitution Committee, considers it necessary to refer them to the Muslim University Foundation Committee, together with its own view on the matters concerned. Moreover, so far as can be judged from the present indications, the Muslim community at large has shown a deep and intelligent interest in the decisions announced in the recent Press communications and has even formed definite views of its own. It therefore, appears far more desirable to the Constitution Committee to ascertain these views through the Muslim University Foundation Committee than to rely on its own unaided judgment. I am, therefore, communicating the Resolutions passed by the Constitution Committee to the Muslim University Foundation Committee for its consideration and necessary action. Copies of these Resolutions are also sent herewith. I hope to address you again on the subject on learning the views of the Muslim University Foundation Committee and through it of the Muslim community. As regards the conclusion at which the Constitution Committee has arrived, I may mention that the deliberations of the members attending the meeting were aided and influenced by the communication received from some of the absent leaders of the community, including H. H. the Aga Khan, Nawab Mushtaf Hussain and Mr. Syed Karamat Hussain and various Muslim Associations and Committees which have been taking an active interest in promoting the proposed University.

With reference to what you call the external relation of the University, the decision of His Majesty's Secretary of State that "the proposed University should have no powers of affiliation outside the locality in which it may be established" caused the members of the Committee the deepest disappointment, and apart from other indications, if the sense of such a representative body can be as I believe it is, a true index of the public opinion of the Mussalmans, the decision of the Secretary of State in this matter seems clearly to have been a cause of great disappointment to the community, as you rightly apprehended in your letter. After very careful and prolonged deliberation the Constitution Committee unanimously resolved with regret that it is unable to modify the Constitution as framed by confining the scope of the proposed Muslim University to the locality in which it is to be established without the power of affiliating institutions outside the locality. The Committee is, therefore, of opinion that further representation should be made to the Government to reconsider its decision.

With reference to the other decisions of the Secretary of State, that the Viceroy should not be the Chancellor, that the University should elect its own Chancellor and that the powers which it was proposed to vest in the Chancellor should be exercised by the Governor General in Council with one exception, namely, that the Professors should be appointed without the previous approval of the Governor General in Council, the Committee has received the decision with extreme disappointment, but it regrets that it is unable to agree to the decision that all the powers which it was proposed to vest in the Chancellor should be exercised by the Governor General in Council.

In the concluding paragraph of your letter you tell me the Secretary of State has decided that the proposed University should in future be styled the University of Aligarh. This decision has caused the Committee much pain, and in view of the fact that it goes against the long cherished and deeply felt sentiment of the entire Muslim community, the Committee trusts that it will also be reconsidered.

I may be permitted to refer to certain statements contained in paragraphs 9 and 10 of your letter which require further elucidation. In paragraph 9 you state that "as regards what I may call the internal relations of the proposed University, considerable modifications of the proposed Constitution will be necessary," and again in the same paragraph you mention that the distribution of powers between the various bodies of the University must be the subject of future discussions. In paragraph 10 you state that "His Majesty's Secretary of State still reserves his discretion as to the Constitution in all details not specifically mentioned in this letter as decided, and particularly in regard to the distribution of powers among the component bodies of the University with a view to the avoidance of likely misunderstanding." The Committee deems it absolutely essential to ascertain definitely from the Government to what portions of the Constitution drafted by the Committee objection is taken, so that on those particulars the Committee may reconsider the draft of the Constitution prepared by it and arrive at final conclusions. I trust you will kindly ascertain the views of His Majesty's Secretary of State indicating any further objections that he may have to communicate, while also mentioning if there is any detail of the draft Constitution to which the Government of India themselves have an objection. On learning these I shall be glad to lay them before the Constitution Committee for further consideration.

UTTERANCES OF THE DAY.

The Mahomedans of India

THEIR PLACE IN THE EMPIRE.

In the course of a lecture on the above subject at the Cambridge Summer Meeting, The Rt. Hon'ble Mr. Ameer Ali said:—

It can hardly be disputed that the real history of India commences with the entry of the Mussulmans. The Macedonian invasion and the friendly intercourse which some of the Hindu monarchs maintained with the Seleucids were episodes. Beyond the legacy of a word now commonly applied to foreigners, Mussulmans as well as Christians, and of perhaps a few interesting relics, they made no permanent impression on the great Continent of India. The attempts to glean a connected narrative of facts from disintegrated inscriptions on rocks and pillars, and coins and copper plates, generally end in disappointment. The Mussulmans lifted the veil that had till then enshrouded the romantic land of Hind from the outside world and brought her into the county of nations. From very nearly the end of the eighth century to the final collapse of the Moghul Empire in the middle of the

eighteenth century—for a period extending over a thousand years, the stream of immigration was continuous. They came from different countries and belonged to different stocks, and they each brought their culture and institutions to the house of their adoption.

When it is remembered that from the middle of the eighth century of the Christian era up to the destruction of Baghdad by the Mongols, Western Asia stood in the vanguard of what is usually understood by the world civilisation in its truest sense, it will be conceded that India gained by joining hands, albeit against her will, with the vigorous races of the countries beyond her borders. The common notion that the Mussulman conquerors destroyed the indigenous civilisation and superimposed on its remains a rough system is found on examination to be untrue in fact. As a writer in one of the early numbers of the *Calcutta Review* remarks, they preserved the old institutions to a far greater extent than is commonly supposed, they were largely conservators rather than destroyers. They destroyed very little compared with other races, nations and creeds of the same or even of later age. When the history of Mussulman India and Mussulman civilisation in India comes to be written in a dispassionate spirit and uncoloured by prejudice, it will be found that mediæval Hindustan and modern India owe much more to the Mussulmans than it is the practice to acknowledge. Like history, architecture was at a discount in Northern India. The Dravidians of the South were great builders. But I trust I shall not be accused of ignorance in saying that the real architecture of India came into existence with the Mussulmans. Architecture and the fine arts were in the hands of the Persians. But the representatives of this versatile nation who settled in India did not devote themselves exclusively to these two pursuits. They shared with the Aïa immigrants the commerce of the country; whilst by their superior training and literary culture, even under the Afghan kings, they held in great part the administrative posts in the Empire of Hindustan. The Afghans and Turks were mostly military men. The natives of the country, both those who adopted Islam and those who adhered to their own indigenous faith, soon came however, to the front, and at a very early time received recognition and equitable treatment.

Occasional outbreaks of bigotry were not unknown, but if truth were told, to a far less degree than in Europe of the same age.

It is a matter for regret that European scholars and students do not study with the same degree of sympathy and interest the history of Islam as they do that of the Greeks or Romans. One would have thought that considering the close affinity which exists between Christianity and Islam, the proximity in time of Islamic civilisation to the progress of the modern world, and the influence Islamic culture and Islamic institutions have exercised in the development of Europe, some more attention would be devoted to Saracenic annals in a broader and more enlightened spirit than is common now.

THE REVENUE SYSTEM.

The Pathan and Mogul sovereigns of India did not adopt the highly organised system of administration which the Abbaasides had introduced into the more progressed conditions of Western Asia and which the Spanish Moors borrowed for their country. But Hassan Masoodi, the Vizier of Mahmud of Ghazni

one of the greatest administrators the East has produced, introduced with mild fluctuations their revenue and land system into his master's empire, and the principles laid down by him were afterwards adapted to Indian conditions first by the famous Akbar Shah and afterwards by Akbar's Hindu Revenue Minister, Raja Jodai Mal, whose land settlement was a monument of industry and has always remained a model for succeeding governments. Draper in his "History of the Intellectual Development of Europe" says in one place, (I am quoting from memory) — "The heavens testify to the Sarracens' work." The agricultural and revenue vocabularies of India bear testimony to the debt that that country owes to her Mussulman conquerors. The cultivator is still the ryot, it will take long years of proscription to drive that word out of use, the advances to the peasantry are still and will always remain the *tasbees*, the autumn and spring crops are still *ra* and *khari*; the village papers are still *Tasneebandis* and *Tasneeb-namatis*, the village administration registers of Northern India are still the *Wajih ul Arz* the rates of rent are still the *shahi*. One of the most noteworthy facts connected with Mussulman influence in India is that even in remote parts of the country far away from the seat of Government, Arabic and Persian expressions relating to rural economy have become incorporated with the language of the people.

Fathian sovereigns ruled over Northern India until the advent of Babur, the grand father of Akbar. The record of his impressions of India is to me a work of enthralling interest, for it is not merely a self-portrait of a great king and warrior, but a description of the country and of the people whom he and his descendants were destined to rule over for two hundred years. But although he had come to live in India, he could not altogether give up the prejudices with which every inhabitant of a temperate climate regards tropical regions.

Akbar came to the throne when he was a lad of fourteen. His grand father and even his father had all the instincts and prejudices of foreigners. Once he took the reins into his own hands he worked after one ideal—to be a national sovereign of an Indian nation, the different elements being bound together by common loyalty to the throne. This was the ideal he left to his successors, who failed to realise it. And this is the ideal he has left to those who have obtained their heritage by devolution. He failed to accomplish the task he had undertaken because he was far before his time. It is doubtful if even now under other conditions and under other inspiration, India is ripe for the consummation that he desired and so conscientiously worked for. That consummation can only be reached when the different communities who inhabit the vast continent have thoroughly realised the value of toleration and good will, of compromise and co-operation, of mutual confidence and mutual respect.

THE BRITON AND THE MOSLEM.

Between the English and the Mussulmans there are special reasons for sympathy and friendship. Christianity and Islam spring from a common stock, their ideals and standards are the same, the early tradition of the two faiths have a common origin. They are not divided by the great gulf which separates the non-Semitic from the Semitic systems. Whatever difference of opinion there may exist between my hearers and myself on this point, there will be none, I believe, when I come to my next ground which is essentially historical. The

English obtained their *de jure* dominancy not by force of arms or by conquest. On the 12th of August 1763 the East India Company obtained from Shah Alam II, the stewardship of the three richest and largest provinces of the Empire, the right of collecting on behalf of the Emperor the revenues of Bengal, Bihar and Orissa—names which must have become familiar to everyone in England in connection with the momentous announcement made by His Majesty King George at the recent Durbar. By the royal firman of 1765, the office of Dewan which until then was vested in the Viceroy of Bengal was entrusted to the East India Company, and with the Dewany they obtained the virtual government of the three provinces. It was, in my judgment, a wise dispensation of Providence that led to the grant of the Dewany to the British. The meaning of this will be clear to those who know something of French administration in Algeria, even at this day how the people are exploited by French and Jewish colonists, how they are gradually being driven out of their homes, how heavily and oppressively they are taxed whilst the foreign immigrants bear little or no share of the taxation, how they are kept out of all share of administration. It is, no doubt, true that the English did not live for many years to the responsibilities of the task entrusted to them. But since those days the progress has been continuous and although much remains to be done, it must be universally admitted that the fate of the country would not have been better in any other hands certainly any other hands. To come back to the Mussulmans of India. The treaty of 1763 after Lord Lake had driven the Mahrattas from Delhi, put the seal on the *de jure* title to the sovereignty of India. It was then that the devolution of authority became finally complete. And when the direct government of the country with all its rights and responsibilities was assumed by the British Crown, the Mussulmans transferred their loyalty, without reservation or a thought of the past, to the Throne of England and that loyalty has been proved not merely on many a field of battle, but under more difficult and insidious circumstances in recent years.

THE INDIAN MOSLEMS TO DAY.

What I have said may, perhaps, induce a conviction in a few minds that the Mussulmans of India are not unjustified in thinking they are entitled to some degree of consideration from the British Government if not more than any other community, certainly not less. Have they recovered it? In the early part of the nineteenth century the heavy hand of the Inam Commission fell most heavily on them in Bengal, Bihar and Orissa, most of their principal families and their lands were passed to other people. (The Inam Commission was a Commission appointed for the investigation of title and if you ever take an interest in the subject—and on the subject of the Mussulmans who were consigned to the trusteeship of British rule, please read my article in the *Nineteenth Century* of 1884, called a "Cry from the Indian Mahomedans." It will, unless I am very much mistaken, wring your heart to know how recklessly, thoughtlessly they were treated in the first half of the nineteenth century.) Since then new factors have sprung up, new conceptions govern administrative actions and the Mussulmans are endeavouring to recover the ground they lost partly from their own fault and partly from the narrowness of vision on the part of the administrators.

MUSSALMAN REPRESENTATION.

Most of us know of the great reforms recently introduced in India which will always remain associated with the name of Lord Morley. Some no doubt think that economic and educational reforms should have preceded political reforms or at any rate should have proceeded simultaneously on parallel lines. It would have been of some advantage to the country to teach the zealous politicians of India the value of uncontaminated water and fairly clean habitations before investing them with the power of interpellation as to the misdeeds of the officers of Government anxious in their efforts to stamp out plague and malaria. Under these reforms the Mussalmans have obtained certain concessions, they have obtained the right to elect their own representatives on the various Councils; and they are seeking for the application of the same principle to the lower representative bodies—municipal corporations, district and local boards. Attempts, however, are frequent to induce Government to withdraw the concessions already made and to refuse those for which the Mussalmans are moving the authorities. Now, I am not a "Separatist." I believe that the development of India on modern lines of progress depends on the cordial co-operation of the two great Indian communities, Hindu and Mussalman, in the work of national welfare. At the same time, I am firmly convinced that the development of each community must proceed on its own ideals and standards of thought and training that any attempt at amalgamation at the present stage would mean the submergence of an ill organised, badly equipped and badly trained minority under a majority vastly superior in numbers and immensely better organised. No one acquainted with the social, religious and moral conditions of the Mussalmans can view such a contingency without the gravest misgivings.

MOSELM BROTHERHOOD.

The Mussalmans' outlook is not confined to India. As in Christianity so in Islam, community of faith, of religious and historical traditions and of identity of institutions draw together into one brotherhood, so to speak, Moslems all over the world. This fact will explain the outburst of sympathy which the tribulations of Persia and the wrongs of Turkey have evoked throughout the Mahomedan world. And I sincerely trust this bond of sympathy will never slacken. How deeply the Mussalmans of India have been moved by recent events is shown not merely by the meetings they have held all over the country and the resolution of protest and sympathy they have adopted, but also by the help they have sent for the relief of suffering among the Turks and Arabs who are making such a gallant fight for freedom against alien subjugation.

England occupies an unique position in the world; with all her mistakes or policy she is recognised to possess a standard of justice which places her above the level of most of her competitors; that standard may often be departed from in practice, but the conscience of the nation does not usually slumber over it and one section or another raises its voice in protest. It is this reliance on the ultimate sense of justice of the British nation which gives England such a hold on the sentiment of the Islamic nations. At this moment the name of England, chiefly through the efforts of her Indian Moslem subjects, stands high in the Moslem world, for it is they who have organised the Missions of Mercy which have gone out from this country as British organisations of the relief of distress and suffering in Tripoli: it is they who are

working to draw the East and West together and to bridge the gulf which still divides the two Faiths that are destined in their respective spheres to regenerate the human race.

MUSSALMAN SAILORS.

England unquestionably is the greatest Mussalman Power of the world. Out of the four hundred millions of people who inhabit the British Empire fully one fourth are followers of Islam. Just consider what this means. Just consider also the identity of ideals which unites by a common bond of sympathy the various Islamic communities. And now think of the immense power for the good of the world, the undoubted, unquestioned and unquestionable loyalty of the Mussalmans of India to the British Throne places in the hands of England. She could, and she can still, secure to the Mussalman nations who are striving for reform and regeneration, that peace, that immunity from harrying which seems to have become a part of modern civilisation, and thus form for herself a bulwark based on the hearts not merely of her Mussalman subjects. In her Mussalman subjects she possesses both naval and military material of no mean value. Mussalman soldiers have proved their prowess on many a field of battle: Mussalman sailors mostly belonging to the same stock as the soldiers, fought in the Company's ships not so very long ago, and they still man the mercantile navy of England. With the ever-increasing number of ships of war for the defence of the Empire, a time must come when immense difficulty would be experienced in manning the vessels. In the hardy seafaring Mussalman population of Western India and the Chittagong Coasts she has materials ready to hand which I hope it is only necessary to mention to attract attention. And if the services of the fighting Mussalman races of India and the borders are utilised as they should be, there would arise no need for introducing conscription in England. The people whose instincts have been suppressed and whose attitude has been allowed to run to seed, would supply a million of the staunchest fighters for England's dominancy in the world, for they believe that she is still, with all her mistakes, in sympathy with their most cherished traditions. It is only to be hoped that no false racial pride or unworthy colour-prejudice would be allowed to stand in the way of utilising the loyalty to the King of the Mussalmans of India.

INDIANS OUTSIDE INDIA.

Tuberculosis and Indians in S Africa.

Dr. Hill, of Verulam giving evidence before the Tuberculosis Commission, said that in his experience tuberculosis was steadily on the increase among the Indians, both the indentured and free classes—more so, he found among indentured Indians. This was owing, he was of opinion, to the poor housing of these Indians and he remarked that it was hardly credible that it took the greater part of a year to get an employer, in many instances, to put up decent buildings in which to house the employees. They provided better accommodation for their animals than for the Indians. These Indians also worked very long hours, indeed, though of course there were exceptions. The nature of the work was, he considered a factor in regard to Indians catching the disease. Those Indians working in the open fields were less prone to the disease than those who were employed in doors, or in the mills. There was a great difficulty in getting the proper sanitary regulations carried out in the way of disinfection of houses where cases of tuberculosis had been notified. Indians were a great deal less cleanly in their habits than natives, and the witness was of opinion that a great deal of the disease was spread owing to Indians expectorating about their houses and buildings. Indian children were fairly free from tuberculosis. The disease had a very quick course among Indians, though he had seen a few recoveries.—*Natal Advertiser*

Mr. Gokhale and the Colour Bar

The London correspondent of the *Times of India* wrote in one of his last letters "Mr. Gokhale has quietly fought out a victory against racial prejudice during his present visit to this country. He booked his passage to South Africa for a berth in a first class cabin on one of the Union Castle liners through Messrs. T. Cook and Son. When the order was telephoned to the Union

Castle offices the question "What nationality?" was asked, and when it was stated that the customer was an Indian gentleman it was intimated that he must pay for the whole cabin (a full fare and a half) since there might be no European passenger willing to share the apartment with him. When Mr. Gokhale was informed of this demand, he refused on grounds of principle to meet it, claiming the right to pay only for the accommodation he required and not for a berth he would not be occupying. The demand of the Company was firmly adhered to for some days, but after Mr. Gokhale had talked the matter over with the Chairman, Sir Owen Phillips, he gained his point. I am told that this is not the first time this awkward question has arisen, and that in one or two cases Parsis crossing the Atlantic, after ineffectual protest, have given way and paid the extra fare for the empty berth. Mr. Gokhale has succeeded in breaking down an unfair racial differentiation, and the precedent of his case will render it difficult for shipping Companies to claim such exactions in the future."

Indians in Fiji.

Indians in Fiji have been repeatedly praying Mr. Gandhi to send some one to study their grievances on the spot. Their grievances as to accommodation on steamers and steam launches—in Fiji—there are small islands about a hundred and fifty—and professional help in law suits have already been published by *The Modern Review*, and elsewhere. Recently it seems arrangement have been made to prevent Indians from holding more than five acres of land. Then there is the new hut tax which presses heavily on Indians and Fijians who are poor.

In answer to their importunities Mr. Gandhi has deputed, Mr. Manilal M. Doctor M.A., LL.B. Barrister at law, who has for four years been in Mauritius, to go to Fiji and help our countrymen there as best he can.

Indian Rupee in East Africa.

In the House of Commons on July 30, Sir John Rolleston asked the Secretary of State for the Colonies: If he will state why the Indian rupee with its artificial value of 1s. 4d. is imposed upon East Africa; and whether he will consider the possibility of applying the profit accruing from the coinage of rupees to the benefit of the Colony of East Africa instead of, as now, being paid as a tribute from that colony to the Indian Government. Mr. Harecourt: The adoption of the rupee as the standard coin in East Africa was the result of the employment of Indian labour in the early stages of the development of the country. The question whether any change in the currency arrangements is now desirable is already under my consideration.

Immigration Department Circular.

A circular letter, addressed to applicants for the admission of their wives, reads as follows:—

"The information in the affidavits in this case has been noted.

"It is clear that, if the applicant is lawfully resident here, a fact upon which he will be called upon to satisfy me, he is entitled to have his lawful wife with him, but he will require to furnish me with unmistakable proof that she is, in fact, his wife and that he has no other. Failing a properly certified marriage certificate, which would be accepted when accompanied by proper proof of identity, I shall not be satisfied to accept such evidence as that now put before me, but would suggest that a certificate of a Superior European Magistrate should be obtained either (1) That, in his personal knowledge, the woman whom he names, and whose left and right thumb marks are certified by him to have been impressed on the document in the officer's presence, is in fact the wife of the applicant, whose identity with the man referred to must be also established by unmistakable means, that he is personally

aware that the parties referred to were duly married on a date specified, or (2) (a) That he has personally held an inquiry upon oath as to the date of the marriage, the ages of the parties, the issue of the marriage, and such other particulars as may be pertinent to such an inquiry; (b) That he forwards the original statements declared before him accompanied by means of identification of both the husband and the wife certified by the Magistrate; and (c) That, in view of the Magistrate, the facts declared to be true and correct, that he has caused police inquiry to be made, attaching a copy of the report, and that he is satisfied as to the relationship alleged, and such inquiry should embrace various independent parties.

"Upon the woman bringing documents in this form, a *prima facie* claim to land will be made out; and under ordinary circumstances I should not place restriction upon her landing. C. W. Cousins, Atg. Immigration Restriction Officer.—
Indian Opinion.

Indians in South Africa.

A Blue book, issued by the Union Government, gives the details of the Census taken in British South Africa on the 7th May 1911. In the whole of the Union there are 60 lakhs of persons of all races. Out of this total, 1,276,242 are Europeans, 149,791 Indians, and 1,905 Chinese. The Europeans form 21·37 per cent. of the total population, Indians 2·51 per cent. and Chinese 0·03 per cent. In the Cape Province 22·71 per cent. of the total population are Europeans, 0·26 Indians and 0·03 Chinese. In Natal 8·22 per cent. are Europeans, 11·14 Indians, and 0·02 Chinese. The European population of the Transvaal stands at 24·94 per cent. whilst the Indian population is only 0·60 and the Chinese 0·06. In the Orange Free State 33·17 per cent. are Europeans and 0·02 per cent. Indians.

Grievances of the Hindus in Canada

Miss Elizabeth Ross Grease, of Strassburg, Saskatchewan, writes to the *Westminster Gazette*—The question of Imperial citizenship surely includes the treatment of such British citizens as the Sikhs of India by the British Colonies. Complaints are heard from Australia, South Africa, and Canada.

It is surely important to have the rights of the Hindus more clearly defined, and some more strenuous efforts made to remove the just complaints of these sons of the Empire.

The Viceroy of India may tour amongst the Sikh States. He may refer to past friendships and loyalty, to heroic deeds for the Empire in former years. But out here in Canada we are cutting away the support of the Sikhs as fast as we can.

Further Hindu immigration was practically stopped about two years ago by the continuous passage clause. This has been interpreted to forbid transshipment. But there is a Hindu community of about 4,000 already in Canada. They have bought land, and wish to settle their families. Two Sikhs brought in their wives and children last December. But they were only admitted under bond.

A deputation of Sikhs waited upon the Government at Ottawa and begged permission to bring in their wives and families to settle upon the land already purchased. They were favourably received. The Hon. R. Rogers promised them that this would be speedily arranged. But a British Columbian member of Parliament protested, and convinced the heads of Government that this act would cause offence to the people of British Columbia, and so the Sikhs were informed that their petition was rejected.

More than this. An order in Council was passed for the deportation of the two Sikh wives, and the women were actually placed under arrest by the immigration officials in April.

They were prevented from deporting them, and on May 24 the Hon. R. Rogers announced as an act of grace, not to create a precedent, that the

wives should be allowed to remain with their husbands and children."

This is the way we foster loyalty to the Empire amongst the Sikhs in Canada.

I have been greatly disturbed to watch the deepening sense of injustice that is growing up amongst these men. It is very difficult for the more ignorant men to understand that it is all done by Canada, and that Great Britain has no part in it. One day in California I met a Hindu. When he learned that I had come from Canada he exclaimed in Hindustani, "my Raja is in Canada." If injustice is done them in Canada, of necessity they associate it with the British Raj.

But the action of the Canadian Government does not express the feelings of the people. It is the result of some vigorous objections raised by a few people in British Columbia. I have been deeply impressed with the quick response Canadians make in this matter to an appeal for fair play and justice. The people are ignorant as to the facts and issues involved.

When the case is fairly set before them they will not support such legislation.

Surely it is not a small matter that this wrong should be righted. The just grievances of 4,000 Hindus, mostly Sikhs, in Canada, affect the welfare of the Empire.

A few people full of prejudices have been poisoning public opinion through the newspapers. The Canadian people only need to be properly informed to win their sympathy and support for the Sikhs. We need a few men who are in sympathy with the Indian problems, and at the same time can enter into the spirit of this great Dominion. They could do much to bridge over the chasm. Tact, sympathy, and a presentation of facts and of the Imperial scope of the problems would win the vast majority of the Canadian people to a sympathetic attitude toward our Sikh brothers.

I commend this Imperial task to the earnest consideration of the British Government.

FEUDATORY INDIA.

Education In Mysore.

The Report on Education in Mysore during 1910-11, records a good deal of progress in circumstances in some respects very unfavourable. The attendance at schools in the State was adversely affected by the severity of the plague. In the previous year 65 schools had to be closed on account of plague, but in the year under review the number of schools closed for that reason rose to no less than 207. Of course even where schools were not closed they suffered in attendance. In spite of all this the increase in attendance, evident for the two previous years, continued to some extent during the year under notice. The percentage of pupils to population of school-going age was 16.9 as compared with 16.8 in 1909-10. These figures include pupils of both sexes; those for boys only show a slight decline. As regards Primary education, we notice an increase both in the number of schools and in the number of boys attending them. The proportion of these pupils to the population of school-going age was 23.5, a trifling decline from the previous year's figure. We observe, however, that of the direct expenditure on education only a trifle over 15 per cent. was on Primary education. Of course Secondary education is a much more expensive process, but it seems to us that the distribution of expenditure between the several main heads deserves some reconsideration. As regards Secondary education, there was a small increase in the number of pupils. The Matriculation results were so far creditable to Mysore that the percentage of success was rather higher than that for the whole University, 21.9 as against 21, but several institutions show very poor results. Turning to College education, we find a substantial increase in the number of students in the Arts classes of the three English Colleges. The University results were on the whole satisfactory, but it is curious that Tamil should

be a weakness. During the year progress was made with the reorganisation of the Colleges in accordance with the new University Regulations.

Passing over much interesting information in the Report, we may draw attention to certain special features in Mysore education. One is religious and moral instruction, which was during this year systematically imparted in the schools and Colleges. "Some of the High school masters and inspecting officers are sanguine about the beneficial results of religious and moral instruction." On the other hand, we read that little or no interest appeared to be taken in it by the students at the Central College. There is an interesting paragraph about the holders of Scholarships in Europe and America. One of these has taken the degree of Ph. D. at Berne, others have secured scientific distinctions, and one has filled in the intervals of a successful scholastic course with lessons on his own account in aviation. One scholarship holder is at Oxford studying forestry, and another is devoting himself to architecture in London. Female education made good progress during the year, with increases in both the number of schools and of peoples. The percentage of girls at school to those of school-going age is given as 5.6. The education of the afflicted is not neglected in Mysore. The State has unfortunately lost an enthusiastic worker for the education of the blind and of deafmutes by the death of Mr. Sankaranappa, but his good work will doubtless be continued with success. A heavy loss to education in Mysore during the year was the death of Mr. J. Weir, Inspector-General of Education, whose services the Government of Mysore have fully acknowledged.—*Madras Mail*.

Rajkumar College, Rajkote.

The annual prize-distribution gathering of the Rajkumar College was held on the 29th ultimo, in the Bhavsinhji Hall, under the presidentship of Mr. J. Sladen, I.C.S., Agent to the Governor in Kathiawar.

Mr. French and Kapurthala.

Mr. MacCallum Scott asked the Under Secretary of State for India: If he will explain under what circumstances the services of Mr. French, of the Indian Civil Service, were lent to the Indian Native State of Kapurthala, and what position Mr. French now occupies in the State, whether he is aware that exception is taken by natives of the State to the levying of a tax last year on the peasantry and tradesmen, contrary to the native custom, to meet the expenses of the marriage of the eldest son of the Maharaja, the sum raised being chiefly spent on the entertainment of foreign guests, and that exception is further taken to the recent increase in the scale of court fees, far above the scale prevailing in British courts in India, whether these measures have the approval of the Indian Government, as represented by the Political Agent; and whether any complaints of harsh treatment of natives of the State by Mr. French have been brought to the notice of the Indian Government.

Mr. Montagu. The services of Mr. L. French were lent to the Kapurthala State in January 1910 for a period of two years to assist in re-organising the administration, and their retention for a further three years has been sanctioned. Mr. French is for the time being a servant of the State, and the matters with which this question deals relate to the internal administration of the State, in which it is not the policy of Government to interfere.

Mr. Alfred Chatterton in Mysore

The appointment of Mr. Alfred Chatterton, C.I.E., of Madras, as Director of Industries of Mysore, is an indication that the recommendations of the Economic Conference are not to pass unheeded. That Conference, it will be remembered, brought forward a whole sheaf of proposals, all of which seemed desirable, provided the people told off to carry them out understood their business. The selection of Mr. Chatterton to lead the way seems to me to have a peculiarly happy decision,

for there are few men locally available who possess the same experience, and none more ready to employ that experience in stimulating the industries run by the natives of this country. In Madras, Mr. Chatterton's experiments were circumscribed by the necessity of not discouraging private enterprise. In Mysore he will no doubt have a freer hand; for industrial development there is still very much in its infancy, and there is not the same risk of colliding either with private interests or with the fiscal prejudices of the Secretary of State. It seems probable that, in these conditions, Mr. Chatterton will feel very much happier than he was in Madras; he has good prospects of success in his new labour. The appointment is nominally for six months only, but it is difficult to conceive that it will not be extended. Mr. Chatterton is already at work. An industrial survey of the State has been ordered, and meanwhile orders have been published sanctioning the opening of an Agricultural School. This determination to start new industries, and at the same time not to neglect the old ones, is a welcome indication of the way in which the Native States are now trying to make the most of their resources.—*Capital*.

Excise Revenue in Mysore.

The Mysore Excise Commissioner's report for the past official year shows that the total excise revenue was Rs. 43,73,580, against Rs. 45,15,445, the percentage of collection being 96.3 against 95.6. The total current demand for the year amounted to Rs. 44,55,423 against Rs. 44,99,279, showing a decrease of Rs. 1,43,856. The fall in consumption of arrack and in the number of toddy trees tapped account partly for the decrease. The shop rent obtained at the auctions under the two main heads of arrack and date toddy also showed a decrease, due to the reaction following on the exceptional conditions that prevailed in the previous year of drought.

INDUSTRIAL AND COMMERCIAL SECTION.

 Synthetic Rubber.

No one fifty years ago, could have imagined the enormous increase that would arise at the present time in the applications of caoutchouc or india-rubber. For many years the demand has far exceeded the supply, and now every drop in the price, even if it be but temporary, gives rise to new applications of the material. One of its most remarkable properties is that of deadening vibrations, peculiarly familiar to all owners of rubber tyred vehicles, including the 'air cushion in the inflated tyre. The use of solid rubber tyres, even of much adulterated material, has such an influence on the vibration of wheeled vehicles as to reduce the cost of repairs to a degree that came as an unwelcome surprise to the coach-builders. So much has the demand for rubber tyres increased that were it not for wholesale excessive adulteration the trade would be starved for lack of raw material.

It was therefore only natural that the recent announcement of Professor W. H. Perkin of the Manchester University that he had prepared rubber synthetically from isoprene made from starch, should have excited the most lively interest not only in the world of science but in every market and every factory where rubber has a place. The account of the discovery is so circumstantial as to leave no room for doubt. It also included a new method of producing fusel oil, which of late has gone up greatly in price on account of its extensive use in the manufacture of celluloid, pegamoid and explosives. Professor Fernbach of the Pasteur Institute, by means of a new fermentative process, has succeeded in obtaining fusel oil at about one-fifth of the recent price. It is from fusel oil that isoprene is obtained and isoprene, under the sodium

treatment gives the new synthetic rubber. An official test of the new rubber was made in Germany, on a motor car which was fitted with two tyres of synthetic rubber and two of the best Para material. After a long test race it was found that the synthetic rubber tyres showed no signs of wear while the Para-tyres were distinctly the worse. This is a good beginning—indeed—it could not be better, but success cannot be really assured until the new rubber, has passed the ordeal of a year at least in a tropical climate. We know how the best quality of rubber inner tyres have only a certain life in India whether they are used or not and the combined effects of sun, air, heat, and moisture must be observed and recorded in order to complete and fix the reputation of the new rubber. The question of price can scarcely be considered seriously until it is manufactured on a commercial scale and its endurance has been well tested. Estimates as low as one shilling per pound are mentioned as the possible cost of manufacture—a figure some growers claim as the cost of production from the tree. The *Times* of June 20th announced that "a company was being formed in connection with the scheme for the artificial production of rubber now being so widely discussed." One thing is certain, that this special research work has already resulted in one valuable discovery already mentioned, which will have an important influence on many industries. Our best wishes will follow the company in its efforts to increase the rubber supply.—*Indian Textile Journal*.

 The Indian Tea Industry.

From *Capital* we learn that the total number of labourers permanently employed on the whole Indian tea industry in 1911 was 526,460 persons, or 6,597 more than in the previous year. Twelve new plantations came into existence. The number of plantations was 4,414 representing an acreage of 574,575.

Education of Factory Boys.

Mr. S. K. Bole, Honorary Secretary, Mill hands and Workmen's Association, writes on behalf of the mill-hands of Bombay: I take the liberty of expressing their gratitude to the Bombay Government for the step they have taken with regard to the education of factory boys. The Government have asked the Bombay Municipality to undertake the work of establishing schools for these boys, and the question is still under consideration. There are two batches of these boys in every mill and during the recess (which is six hours in all, as the boys are half times) they should be made to attend these schools. Some of the mills in Bombay have established such schools in spite of the articles of association, but owing to lack of supervision they are not well conducted. If they are properly supervised by the educational inspectors and are well conducted, they will be very useful. These schools will be regularly attended by the boys, owing to the moral influence which will be exercised over them by their superiors in the mills.

As to the question of the maintenance charges of these schools, it will be seen that each school will have to bear an expense of Rs. 50 or so per month, which the mill owners can very well afford to pay, the reason being that the forfeited amount of wages, etc., accumulated at the end of every month amounts to a good round sum, and a small portion of this cannot be better utilized than towards this laudable object.

In Ceylon it is obligatory on the part of the owners of factories to impart education to the children of workmen employed in their factories. Why should not Bombay, the first city in India, try to follow the example of Ceylon?

Without compulsion, it will be impossible for the Municipality to attract these boys to schools, and so the mill owners should exert themselves in this direction.—*The Indian Textile Journal*,

Paper Towels

It has been recently remarked that paper towels are of great hygienic value. In many schools, clubs and hotels in America these towels have been introduced. After being used once they are thrown away. Germany has also taken up the subject. Three prizes were recently offered at a recent congress of the German Public Baths Association for a good paper towel, and the winning specimens will be introduced into schools, railway stations, restaurants, and into all places where people congregate and require something for drying freshly washed hands. Great Britain has not lagged behind other countries in the application of paper for practical purposes, and the import of paper into England is steadily increasing. In 1906, 831, 136 tons of paper making materials were imported and in 1910, 1,085, 542 tons. The import of rags is thus falling away, and that of wood pulp is increasing.

Dry Dyeing.

In a number of instances it is desirable for many reasons, in the dyeing of certain classes of fabrics, to avoid the use of water as the vehicle for bringing the colouring matter into intimate contact with the fibre. Generally, benzine is used for the purpose, but it has the disadvantage of being dangerous in use and does not admit of the production of very even dyeing, nor of colours. As a means of getting over these drawbacks, a method has been devised of which two examples are given—(1) 10 parts of roccelino are dissolved under the application of slight heat in 890 parts of alcohol, to which is then added 100 parts of 100 per cent formic acid; the resulting clear liquor is added to 2,000 parts of carbon tetrachloride. (2) 10 parts of formyl violet S₄B are dissolved in 890 of alcohol; 100 of 100 per cent. formic acid are added, and the whole mixed with 1,950 parts of carbon tetrachloride and 50 of saponine. These, and similarly prepared solutions, are applied by the customary methods.

Sewing on Buttons by Machine.

The old method of sewing on buttons by hand on underwear is now entirely superseded by machine sewing, machines having been developed to that point when labour cost is not only greatly reduced but the character of the work is much more reliable, so that, at least on knitted underwear, hand sewing is entirely done away with. The Union Button Sewing Co., of Boston, Mass., who have made button sewing machines for twenty years, have now a machine which sews shank buttons, i.e., covered buttons, of all kinds, and sizes, on sweater coats, and other fabrics, either ivory buttons with holes through the shank under the button, or brass with metal shank, etc., as securely and rapidly, and with the same ease, as four holed buttons are now sewn by machine. The machine may also be easily and readily adapted to sewing on the hooks and eyes used on so many sweater coats, and jackets. It has no bobbins to wind, and it makes an elastic yet firm stitch, automatically trims the thread on every button, and leaves a uniform and neat finish on the back, with no threads tangling and ensnared.

—*Science Siftings.*

Railway Extension in India.

Sir J. D. Rees asked the Under-Secretary of State for India: Whether the Government of India proposes to construct a branch line from Salur, in the Vizagapatam District, up the Eastern Ghats to the plateau of Jeypore, Vizagapatam; whether he is aware that the proposed extension of the Bengal Nagpore-railway from Dumberi to Jagdalpore and Kotpad will not benefit the extensive upland region of Jeypore. now bereft of railway communication, the produce of which cannot stand the long lead by rail to Bombay and Calcutta by way of Dumberi and Raipore, but will continue to use the cart-road down the Ghats to Salur and on to the port of Bimlibatam or Vizagapatam; whether he

is aware that the traffic of this branch has been estimated by local authorities to be more than sufficient to justify the construction of the proposed branch and of a harbour at Vizagapatam; whether he is aware that such harbour would serve as a port of refuge for vessels of the Royal Navy as well as for those of the mercantile marine, no such harbour now existing north of Colombo; and whether the Government, in consideration of these circumstances, will move the Governments of India and Madras to construct the branch from Salur to Jeypore with the aid of the chief zemindars and others concerned.

Mr. Montagu: I understand that representations have been made to the Government of India as to the desirability of the provision of a light railway from Salur to the Bastar country, but the Secretary of State has received no communication from the Government of India on the subject. The question of the construction of a harbour at Vizagapatam is under consideration.

Japan's Foreign Trade.

Reviewing Japan's foreign trade for the year ending June 30th the *Tokyo Asahi* regrets to observe that the imports exceeded the exports by 120,243,000 Yens. With the exception of 1905, when for the first six months the excess of imports over exports amounted to 143,694,000 yens the figures for the current year are unparalleled in the annals of the country. Such a discouraging state of affairs, the paper points out, is mainly due to the introduction of foreign funds in connection with the municipalization of the Tokyo Electric Car Company, thereby increasing the volume of currency and causing the prices of various articles to advance. The unprecedented excess of imports over exports during 1905 was due to the introduction of funds necessary to carry on the struggle with Russia. The paper therefore expresses the hope that the introduction of foreign funds will be suspended as far as circumstances permit — *The Times of India.*

State and Industries.

At the last National Industrial Conference the Hon. Mr. Dadabhai suggested that the industries at present conducted with the help of foreign capital in India might be bought over by local capitalists, and that the Government, in granting concessions to foreign capitalists, might make a provision for the compulsory transfer of such industries to Indian capitalists after some years. The *Tribune* of Lahore writes—"This latter suggestion was most unwelcome to the Anglo-Indian press and they poured contempt and ridicule on Mr. Dadabhai's head for the extravagance and impracticability of the demand. We now have a case of a self governing colony of the British Empire compulsorily acquiring for the nation an industry started by private capitalists and worked with success by them for a number of years. This is, of course, the nationalizing of the iron and steel industry of New South Wales. The Minister of Public Works in that Colony has declared that he could establish works and turn out all the steel and iron required for the whole Commonwealth for an expenditure of £2,000,000, or about ten thousand tons a week. A bill has been introduced to authorise the establishment or purchase of such works by the State. The Victorian Government has already wrested the brickmaking and coalmining industries from private capitalists. Thus in the Commonwealth private capitalists, most of whom must be English, are being gradually ousted from the colonies. Of course the organs of the capitalists try to make out that the State-owned industries have not been successful. But these croakers will be silenced when the State concerned issues their reports. What we desire to call attention to at present is the soundness and feasibility of the proposal which when applied to India is described as wrong-headed and impractical."

A New Cottage Industry.

We published recently in our columns a very interesting letter from Mr. Edward Jackson, Superintendent of the Tata Silk Farm, Bangalore, on the progress of sericulture in Mysore. The industry appears to have great possibilities in the State, and its encouragement, it will be remembered, was the subject of some of the recommendations of the recent Economic Conference. What, however, appears to us to be of the greatest importance is the suitability of sericulture as a cottage industry. There can be little doubt that in the present stage of industrial development in India cottage industries are of far more benefit to the people than factory industries, and for this reason we consider that Mr. Jackson's work at the silk farm is of the greatest importance. The advantages of a second industry for the peasantry, which may be pursued along with their normal calling of agriculture, need not be dilated on, and it is satisfactory to learn that sericulture is likely to prove exceedingly remunerative. Apparently it is also being taken up to some extent by the Anglo-Indian colonists at Whitesfield, and should this experiment prove a success, a new field of employment is opened up for the dominated community. The investigation of the possibilities of sericulture as a cottage industry is already proceeding in Mysore, and we are inclined to think that the question might profitably occupy the attention of the Madras Government, and particularly of the Agricultural Department. If the industry is possible in Mysore, there must also be districts, in the Madras Presidency where it might be followed with profit, and the Government would do well to take up the matter.—*Madras Times*.

AGRICULTURAL SECTION.

Improvements in Indian Agriculture.

Mr. Hiralal H. Pandya sends us the following suggestions for the Improvement of Indian Agriculture :—

A FARMER CANNOT BE SUCCESSFUL UNLESS HIS WANTS ARE FULFILLED.

I. To study the condition of the farmers and to supply their wants. They should be turned from other industries or labour on the working of the land. Their land should be in proportion to their capital, labour capacity, and resources at command.

II. Breeding and improvement of cattle by selection from the village herd and the cultivation of the pasture land should be considered. Provision should be made for the sufficient food supply of the cattle. Village pasture should be in proportion to the number of cattle, ought to be cultivated and properly fenced. One bull of pure blood should be kept for breeding the cattle of each village. The bull should be fed commonly and the Patil of the village should be held responsible for the care and maintenance of the bull.

III. Attention be drawn to spread and prevention of cattle diseases. The headman of the village must report for the aid of the Veterinary Officer.

IV. The quality of the seed should be improved. It should be pure, vital, free from admixtures and of improved varieties according to Market demand and local conditions. It is better to introduce the method of selecting seed from the plants by labelling them when on the field. The vitality is lowered and the varieties are mixed in the case of cotton ginned in the Factories in spite of the separate grouping.

V. Question of foreign implements which are labour-saving and suited to the local conditions be introduced and the necessary improvements in the country implements should be made.

VI. Question of manure. Prevention of loss in the storing and application of village waste, rubbish, cattle-dung, night-soil, should be made good and the want of fuel-supply for the cultivators be remedied.

VII The cultivators to be advised in the method of timely cultivation of the land and to prepare their land for sowing, to destroy the weeds, and to store up the moisture.

VIII. Such instruments as water-lifter and well boring machines should be studied and tried and the irrigation facilities made in the districts from the constant flowing rivers by tank and check methods.

IX. Some of the most important diseases of the crops like rust in wheat, smut in jowar and wilt in the cotton which destroy the crops when they appear should be first decided and then preventive and curing methods tried.

X. The cultivators should be made known with the nature of the insects destroying the crops and with their feeding and general habit and should be informed of its preventive and destroying remedies.

XI. The crop varieties cultivated in the locality should be improved in the lines of commercial market.

XII. Some of the new crops of commercial value and suited to the locality should be introduced.

XIII. The land put under the waste class should be well studied and then it should be seen as to why it was so caused and the methods of its improvements tried.

XIV. The saline or usar land which forms the most part of barren land should be reclaimed according to the latest experiments carried out by the Government Department of Agriculture.

XV. The relation of agriculture to commerce in local and distant markets should be studied and its knowledge widely circulated amongst the cultivating class.

XVI. The State should either advance money by Takavi System to the cultivating class to carry on the operations or the central Bank in charge of the Vahivatdar (Revenue Officer of the District) and the Co-operative Credit Society be introduced

XVII. There should be in each division or Taluka a cultivator's class for imparting education in vernacular language in Agriculture and training them in practical Agriculture on improved lines

XVIII. In every division or Taluka there should be annual fairs and shows in general agriculture and cattle under the patronship of the State aided by the Vahivatdars, Patils and the Veterinary officers. The Agriculturists should deliver lectures and demonstrate on different subjects and the prizes should be distributed for the best collections.

XIX. Pamphlets in matters of agriculture printed in vernaculars should be distributed freely from time to time

XX. The agriculture in the State should be always progressive on improved lines with other countries through reports and Agricultural Periodicals of other nations

XXI. Some of the Agricultural industries such as Lac and Sericulture should wherever possible be introduced.

XXII. Each State should establish one information Bureau supplying information gratis to the cultivating class

XXIII. There should be established one Central State Experiment Farm to conduct the experiments in various lines.

XXIV. The successful experiments should be demonstrated to the cultivators

XXV. State should establish the seed farms and supply the selected varieties of local and new crops to the farmers with moderate rates

Recent advances in Agriculture

In a paper recently read before the Royal Institution, Mr A. D Hall, F.R.S., said that the fertility of the soil was the outcome of a series of factors, including the actual supply of plant food in the soil, its mechanical texture as conditioning the movements of water, and the particular micro fauna and flora inhabiting the soil, for upon those lower organisms depended the facility with which the material contained in the soil became available for the nutrition of the plant.

Soil Erosion.

Of the many problems connected with soil fertility, few are more important than those centring round soil erosion. Whenever land is brought into cultivation and then neglected, erosion is likely to be serious, only when the surface is covered with vegetation can it resist the disintegrating effects of the rain. Very slight depressions in the surface suffice to form a channel, which rapidly widens and deepens, and before long attains considerable dimensions. The remedies consist in planting the land and in terracing.

Irrigation in India

The Annual Review of Irrigation in India for 1910-11 has been issued. The total area irrigated was 22½ million acres. The value of crops raised is roughly estimated at Rs 62½ crores. The total area irrigated by productive works amounted to 14,175,000 acres. Towards this total the Punjab Canal contributes 6½ million acres, Madras 3½, the United Provinces 2 and, Sind 1½ million acres. In Bengal an area a little short of 900,000 acres was attained. The return of capital is the highest in the Punjab, where the canals yielded 13 to 16 per cent. The next Province in this respect is Madras, where a return of 12.6 per cent was realised, excluding the Kurnool and Barur systems, the expenditure on which is charged to revenue. In the United Provinces and Sind the returns realised were 7.01 per cent and 6.21 per cent, respectively.

EDUCATIONAL.

SCIENTIFIC STUDY OF SANSKRIT.

Professor Tarachand Roy, M. A., research scholar, Punjab University, formerly Professor, Oriental College, Lahore, has been awarded by the Government of India a State Scholarship for the scientific study of Sanskrit in Europe.

AN ELEMENTARY EDUCATION LEAGUE

In connection with his praiseworthy proposal for the establishment of an All Malabar Elementary Education League, Mr. M. C. Krishnavarma Rajah proposes forming a Company with a capital of Rs. five lakhs, divided into 50,000 shares of Rs. 10 each. The concern will be registered under the Indian Company's Act.

INDIAN EDUCATIONAL SERVICE

The following *communiqué* was issued by the Educational Department on August 6th—The Government of India had last year decided to address the Secretary of State regarding the pay and prospects of the Indian and Provincial Educational Services. In view of the probability of the formation of a Royal Commission on the public services in India, the communications were delayed. Pending the results of the Commission's enquiries no further action is possible.

EDUCATION IN ENGLAND AND INDIA

The Thakore of Limbdi, in the course of a visit to Kensington College, addressed the pupils. He said the education of his fellow subjects in India had long received his careful attention, and he was glad to be able to visit such an institution as Kensington College in order that he might learn how the work of training the future business men and women of this country was being carried on. They were giving their attention to education in India. India was the backbone of the British Empire, and they hoped that India would rank eventually as one of the best educated

"MARK-HUNGER."

In a paper contributed by Miss Charlotte Mason to the Conference of the Parents' National Educational Union at Winchester occurs the phrase: "Mark-hunger and knowledge-hunger cannot co exist." Few thoughtful persons will dispute this dictum. Yet in our secondary schools we still see the most elaborate systems for giving, recording, and collecting marks. One may hear lessons in which all the energies of the teacher and pupils appear to be devoted to the accumulation of numerical marks as estimating the pupil's knowledge or intelligence. Each pupil must have an opportunity of answering the same number of questions; the questions must be of the same difficulty. Concentration on the subject in hand is prevented, and an entirely false value given to the lesson. Tests are admissible. But constant hourly assigning of marks is an indefensible institution.

POST GRADUATE STUDIES

At a recent meeting of the Senate of the Calcutta University, the Vice-Chancellor, Sir Asutosh Mukherji, gave some interesting figures relating to the progress of post graduate studies in that University. In Pure Mathematics, they had in the fifth year class more than 90 students, in history nearly 80, in English more than 60, and in each of the two subjects, Economics and Mental and Moral Philosophy, more than 50. The total number of students registered for the fifth year classes was 350, while in the sixth year classes they had an aggregate of nearly 200. The number of students thus directly receiving instruction in post graduate studies in the Arts Faculty is, thus, 550. They had in addition more than twice as many in the University Law College. Thus, between the two faculties the University was responsible directly for the instruction of more than 1700 students. "I venture to express the hope," concluded the Vice-Chancellor, "that the University may now rightly be called a teaching University."

LEGAL.

JOINT FAMILY SYSTEM.

A full bench of the Madras High Court consisting of Justices Wallis, Sundara Iyer and Sadasiva Iyer disposed of a case in which the question raised was whether the marriage of a male member of a joint Hindu family of a twice born caste was a necessity and whether a debt contracted for the purpose of marriage in such a family was binding on the other members of the family. Their lordships were of opinion that marriage was obligatory on Hindus who did not choose to adopt the life of a perpetual Brahmachari or Sanyasi. That being the case a debt reasonably incurred for the marriage of a twice-born Hindu was binding on the other members of a joint family.

ADVICE TO MAGISTRATES.

At the Calcutta High Court on Aug. 8, Justices Carndoff and Imam gave some sound advice to Magistrates in delivering judgment in a revision case in which a rule was issued for the transfer of a case from the file of Mr. Warde Jones, Magistrate of Purnea. The rule was issued on the ground that the Magistrate used unbecoming language towards complainant. Their Lordships in transferring the case, observed "Witnesses are entitled to the protection and nothing can justify the very unbecoming language used by the present trying Magistrate towards the petitioner. A Magistrate should remember always that the dignity of the Court in which he presides is in his keeping. The trying Magistrate seems to have forgotten that in this instance. We further observe, we regret we have to observe, that some of the trying Magistrate's remarks on the order sheet indicate that he is supposed to place the state of his return of work above other considerations."

JOURNALISTS AND JURIES.

The text has been issued of the bill presented by Mr. Braby, M.P., to exempt journalists from liability to service on juries. The measure provides that all journalists within the meaning of the bill are to be absolutely freed and exempted from being returned and from serving on any jury, inquest, or inquiry whatsoever, and their names are not to be inserted in the list of the persons qualified and liable to serve on the same. A journalist within the meaning of the bill is defined as a person who has been for not less than three years professionally, habitually and as his sole or chief occupation engaged upon the staff of a journal or news agency in the capacity of editor, writer of leading, special, or other articles, correspondent, artist, literary manager, assistant editor, sub editor, or reporter, or in supplying journals with articles, illustrations, correspondence, or reports.

INDIAN BETTING ADVERTISEMENTS IN CEYLON.

A Draft Ordinance has been published in a recent "Gazette" "to deal with the Indian betting advertisements which are from time to time published in the local papers." By an amendment of the Penal Code in 1909 the abetment in Ceylon of an act done outside Ceylon, which would constitute an offence if committed in Ceylon, was made punishable; but from the definition of the word offence, viz, a thing made punishable by the Penal Code, the amendment could only apply to offences coming under the Penal Code. The keeping and advertising of betting establishments is an offence under the Game Ordinance, and not under the Penal Code. Advantage is now taken of a section of the Code which provides in certain specified section that "The new 'offence' denotes a thing punishable in Ceylon under this Code or under any law other than this Code," to include the amendment referred to, of 1909 amongst the specified sections.

MEDICAL.

THE OPIUM SMOKER.

We find this paragraph in the report for 1911 upon Weihaiwei:—

The excessive use of alcohol, to which reference was made in the Report for 1910, is on the increase. Cases of drunkenness, which till recent years were very rare among the Chinese of this territory, are now becoming more numerous, and the Chinese themselves say that this is due to the suppression of opium smoking.

If the Chinese are giving up opium only to relapse into excessive drinking the remedy may well prove worse than the disease. In Weihaiwei, the Chinaman who wishes to smoke opium can only do so by license and the report contains some curious remarks upon the position. The number of persons licensed to smoke opium during 1911 was 42, as compared with 50 in 1910. The licensed smokers are all either over 50 years of age or suffer from some chronic disease.

A METHOD OF PROLONGING LIFE

Two doctors of Paris, Professor D'Arsonval and Dr. Montier claim to have discovered a method of prolonging life. Briefly, their theory is that the decay of the arteries from which all death and disease spring may be prevented and cured by an electric current. It is therefore believed that the day of dosing with stimulants and medicines is gone and that electricity almost universally takes their place.

THE SANITARY CONFERENCE

The All India Sanitary Conference will be held at Madras early in November, and Sir Harcourt Butler will be present. The Government of India will have ten Delegates, Madras 13, Bombay 6, Bengal 8, United Provinces 4, Punjab 5, Burma 4, Bihar and Orissa 3, Central Provinces 2, and Assam 1. Ceylon will have three representatives.

INTOXICANTS AND NARCOTIC DRUGS IN INDIA.

Sir J. D. Rees asked the Under-Secretary of State for India.—If he will state what is the liquor bill for the British Indian Empire, and at how much per head the figure works out for the latest year for which statistics are available; and whether he will give the like information, if it is obtainable without undue research and trouble, for compounds and derivatives of opium, cocaine, and drugs of a similar character.

Mr. Montagu.—The taxation receipts under Excise in 1910-11 amounted to 7,030,314*l.*, distributed in round numbers follows:—From foreign liquor and liquor made in India by European methods, 3,000,000*l.*; country spirits, 37,000,000*l.*; toddy and pachwai, 1,200,000*l.*; opium and other drugs, 1,800,000*l.*; fines, etc., 30,000*l.* There are no reliable data from which the consumers' total disbursements on account of liquor and drugs can be computed with any accuracy, but on a conjectural estimate they might be put at about 10,000,000*l.*, or 10*d.* per head of the population of British India.

CAN MEAT BE LEFT OUT OF THE BILL OF FARE?

An expert opinion in *The Indian Daily News* answers the question in the affirmative. He admits that meats are typical of the 'proteid' class of food stuffs and are rich in muscle-forming elements. They contain about 20 to 25 percent of the muscle-forming elements, which is slightly lower than nuts and somewhat higher than peas, beans, cheese and eggs do. Thus, though meat contains a certain amount of muscle-forming elements, there are also various vegetable substances which contain an equal or even a greater amount. According to this authority, man is not intended to eat meat in large quantities. He may take a small quantity without doing much harm to himself. But he will do better without it, taking instead a dish of peas, beans or lentils; a couple of eggs; some cheese and a few nuts.

SCIENCE.

A GRAVITY THEORY.

How gravitation is propagated instantaneously to vast distances, as it has appeared to be, has been one of the profoundest mysteries. In a French Academy paper, Prof. Boussinerg has offered a new theory, assuming that each body, each material point in space, is surrounded by an infinitely attenuated "presence," and that this connects it—like an elastic band—with all other bodies within its range of action. The variations of action are not successively transmitted, so require no time. The presence follows the material body wherever it goes, and with it goes the mutual attraction on other bodies. This hypothesis seems to agree with that of a continuous medium—or other—filling all space—*Science Siftings*.

SUNLIGHT KILLS FLEAS.

Another reason has been found why people should allow plenty of sunlight to enter their rooms. So often recommended as a destroyer of bacteria, it has now been proved to be fatal also to some insect life. In his experiments in India, Dr. Cunningham has included many with fleas, which have come to be much dreaded as disease carriers, and they succumbed very quickly. For instance, he placed 100 fleas in a piece of carpet exposed to the sun in a tin vessel. They tried to escape from the sunshine, but those on the top of the carpet were dead in seven minutes, and those hidden beneath survived less than half an hour.—*Science Siftings*.

A NEW FORM OF DARK RADIATION.

A new form of dark radiation seems to have been discovered by Professor A. Renle, who has been experimenting for some years with nitrate of boron. He has found that this substance gives off at ordinary temperature radiations which will influence a photographic plate through several

thicknesses of black paper, leather, India rubber and glass, and the images obtained strongly resemble those given by the X-rays. The radiations are completely absorbed by metals. Electroscopic examination show that nitrate of boron—like nitrate of uranium—emits electrons, or negative particles, and it is suggested that this points to some connection of nitrogen with radio-active phenomena hitherto unsuspected. It is certainly curious that up to the present, radio-activity has generally manifested itself in the presence of salts.

A RESEARCH ON RADIUM.

Although the Radium Institute has been established for some time, the amount of exact information upon the modes of action of this mysterious product is still very small. Dr. Bellingham Smith publishes in the *Quarterly Journal of Medicine* a list of findings upon the excretion of radium; although somewhat indefinite on many points, they nevertheless form an advance upon current knowledge. After the administration, by the mouth or by injection, of radium a widespread degree of radio-activity is evident throughout the body. Elimination of radium takes place principally and rapidly by the bowel, in a minor and slower degree by the kidneys, and (in mice at least) not at all through the liver or skin. Radium emanations can be obtained in solution in various media, and can be introduced into the body in small doses by inhalation, feeding, or injection. After any such administration, however conducted, a general radio-activity of very brief duration is caused throughout the body. Elimination of the emanations, in contrast to that of radium itself, takes place almost entirely through the lungs, and to a very slight extent through the kidneys. If insoluble salts of radium are administered by the mouth little if any will be absorbed; but if the same preparations are given by injection into the tissues, elimination is so slow that they may be regarded as permanently present.

GENERAL

FROM CALAIS TO CALCUTTA.

In the course of an article on the Trans Persian Railway scheme Mr. Lovat Fraser writes in the *Daily Mail*:—

"Before long the great Trans Persian Railway scheme will transcend all other issues in the Middle East. Already it dwarfs the internal problems of Persia, and the recent debate in the House of Commons revealed the hold it has taken upon men's minds.

"The attitude of the Radical Party towards the scheme need not concern us very much. It is dictated not by anxiety about the safety of India, rather by hatred of Russia. Had the Trans Persian lines been a German project it would have been overwhelmed with benedictions. Although Russia is literally the most democratic country in the world to-day, it is hated because in some muddled way it is supposed to be at variance with the intangible thing called Liberalism. Radical opposition to the Trans Persian scheme arises from sentimental hostility to Russia and has little relation either to the merits of the proposed railway or to the safety of India."

After discussing the military aspect of the question, he concludes:—

"In this matter we need larger vision. We must look out over Asia and the rest of the world and see more clearly the tendencies at work. Everywhere the locomotive is bursting through frontiers, as it has burst through the walls of Peking and the Great Wall of China. We cannot resist the inevitable. There is no reason why we should try to do so. We cannot tell people that they must continue to take fourteen days to get to India when they might reach there in seven days.

"The House of Commons once decided that to build a bridge across the Thames at Westminster would bring about the disruption of England,

When we are entering the Calcutta Express at Calais we shall place the opposition to the Trans-Persian Railway in the same category as that remarkable resolution."

WOMAN SUFFRAGE IN AMERICA.

In spite of the growth of the movement for woman suffrage in America, it is not generally known even in the United States that there are six States in which women of twenty-one years of age have the right to vote at all Elections. These States are California, Colorado, Idaho, Utah, Washington, and Wyoming. The Census Bureau at Washington has just completed the tabulation of a preliminary statement which shows the number of woman who are entitled to vote in these six States, as shown by the returns of the 13th Decennial Census, which was taken in April, 1910. The total number of woman in these six States who were of voting age in 1910 was 1,346,925, of whom 654,784, or 48.6 per cent, were native whites of native parentage, 333,925 or 24.7 per cent, native whites of foreign or mixed parentage; 327,682, or 24.3 per cent, white immigrants, 13,463, or 1 per cent, negroes; and 17,046, or 1.3 per cent, Indians and Asiatics.

ARE THE PARSEES DECAYING?

Commenting on Sir Dinsha Davar's recent article on "The Decadence of the Parsees of To-day" the *Indian Social Reformer* writes:—"The fact of the matter is there is no future in this country for Hindus as Hindus, Mahomedans as Mahomedans, and for Parsees as Parsees. And it is because Sir Dinsha Davar seems to ignore this fact, which must be patent to all observant minds, that we have thought it necessary to notice his article. Those who aspire to revive the supposed glories of the past on the lines of communal development are doomed to utter disappointment. The future is for those who, while being reasonably proud of the achievements of their ancestors, are able to understand the future has an even greater opportunity of achievements, and apply themselves heart and soul to realise them."

THE INDIAN REVIEW.

A MONTHLY PERIODICAL DEVOTED TO THE DISCUSSION OF ALL TOPICS OF INTEREST,
PUBLISHED ABOUT THE THIRD WEEK OF EVERY MONTH.

EDITED BY MR. G. A. NATESAN.

Vol. XIII.

OCTOBER, 1912.

No. 10.

THE KALA AZAR, (BLACK FEVER.)

BY

DR. VISHNU T. KORKE, M. R. C. P., (Edin)
Officer on Special Duty, Kala Azar Enquiry,
(for the Government of India), Madras.

I AM requested by the Editor of the *Indian Review*, to contribute a short article on the Kala Azar for the benefit of the general public. I gladly respond to his request for two reasons. In the first place, the reading public, specially in Madras, may become aware of the danger, lurking amongst them; in the second place, by comprehending the situation, they may materially help the scientific investigations that are being done amidst them.

TWO MOMENTOUS DISCOVERIES.

In the late seventies, a young French Army Surgeon named Laveran discovered the parasite of malaria. The parasite was studied as a 'one-celled' organism, belonged to the animal kingdom and consequently was classified in the order known as "Protozoa."

The protozoa is an animal cell unicellular in structure, containing an active protoplasm and nucleus, and forms the boundary limit between the two important kingdoms, viz., animal and vegetable.

This was a momentous step as it shewed that animal cell played an important role in the causation of diseases such like malaria, Kala

Azar, sleeping sickness, relapsing fever, syphilis etc.

The bacteria are the cells from the vegetable kingdom and are responsible for a variety of diseases all over the world.

Nearly twenty years later an equally important discovery was made by Sir Ronald Ross. He shewed that insects like mosquitoes carry malaria to the human beings.

Since then, tremendous advances have been made in our knowledge about the protozoa and their carriers, and the sciences dealing with them are known as protozoology and medical entomology, respectively.

THE PARASITE OF KALA AZAR.

The parasite of Kala Azar belongs to the order of protozoa. Its discovery was made simultaneously by Sir William Leishman and Colonel Donovan of Madras (1903). As is usual with the scientific nomenclatures, the parasite was named after these two discoverers and is known to the profession as *Leishmania Donovani*.

THE PARASITE IN THE HUMAN BODY.

If one pricks a finger from a case, takes a drop of blood, makes a smear on a glass slide, properly

stains it, and examines it under a high power microscope, the parasite will be seen in a small rounded form, dotted with two differently shaped masses, known as nuclei. The parasite is not free. It is engulfed in the body of different types of white cells, normal to blood

In medical language it is expressed that *Leishmania Donovanii* is found in the polymorpho-nuclear and mononuclear leucocytes in the peripheral blood (see diagrams). The parasite is not restricted to the blood from a finger only. It is also found in the deep-seated organs and tissues, like spleen, liver and bone-marrow.

By resorting to expert means, one is able to draw blood from liver and spleen (Hepatic and Splenic punctures) and to demonstrate the parasites from smears made from them.

Because the parasite is found in blood, liver and spleen, a physician, takes the blood from a patient and feels for the enlargement of the two latter organs in the diagnosis of the disease. In deep organs the parasite is found in certain varieties of body-cells called "endothelial cells."

THE PARASITE OUTSIDE THE BODY

Like bacteria, if proper composition of food at a certain temperature is supplied to this parasite, it is able to grow and multiply. It grows best at a low temperature between 18° to 22° Centigrade and the multiplication goes on perhaps by millions and billions.

Medically this is known as "*L. Donovanii* can be cultured?" The food on which it grows is called a "culture medium."

Herpatomonad forms "In culture."

In "cultura" the parasite may not necessarily look like a rounded body. Usually it has assumed now the shape of a pear or a banana—tapering into a long cord (like a whip) which presents many wavy folds. We now call it a "Flagellate." And the stage is familiar by the name of "Herpatomonad" form.

To detect all these phenomena one requires the aid of a high power microscope.

THE CHANNEL OF ENTRANCE INTO THE BODY AND THE BEHAVIOUR OF THE PARASITE IN THE BODY

We are ignorant of the fact as to how a parasite gains access to the body. Capt. Patton of Madras, made experiments in bed bugs and he came to the conclusion that bugs suck parasite from a case of Kala Azar and while feeding on a healthy individual, transmit the disease.

When the parasite gains access to the body, by channels which are as yet to be definitely determined, it goes to suitable places, which give it a shelter.

Here it feeds on the vital components of the body, cells, grows and multiplies. In doing so it gives out some sorts of poisons, which we call "Toxins."

It perhaps grows by millions and the severity of the case may depend upon the rate of growth, on liberation of "toxins," and many other conditions.

PICTURE OF KALA-AZAR.

From the time the parasite has gained access to the body, till the patient shows certain initial signs and symptoms, a period of quiescence elapses. It may be days, it may be weeks and months. This period is known as the "In

incubation Period." After this period, begin the characteristic signs and symptoms of Kala Azar. Sometimes there is such a diversity of symptoms, that Kala Azar may be mistaken for many conditions, like simple dysentery and diarrhoea. It is usually mistaken for malaria and typhoid fever, and waylays a physician from the right tracks.

By the application of advanced methods of diagnosis alone, one may be able to pronounce it to be a case of Kala Azar.

The patient gets irregular fever, and consequently the usual accompaniments of fever. He notices that he is wasting, losing flesh and weight. He cannot apply himself to work. His spleen begins to grow and in many cases it entirely covers the cavity of the abdomen. The liver gets enlarged, face and ankles gets puffy. Sometimes he gets black pigmentation on many parts of the body, hence the name of the disease "Kala Azar." Attacks of diarrhoea, dysentery trouble him, he goes from bad to worse, is reduced to skin and bone and the final chapter is closed with some ulcerative condition of mouth, dysentery or pneumonia.

Such in short is a typical picture of Kala Azar, though diversity of symptoms is not an exception.

THE GEOGRAPHICAL RANGE OF KALA AZAR

AND ITS SPREAD.

Kala Azar is known in Assam along the Brahmaputra Valley, Bengal and Madras. It has depopulated many areas in Assam. It has slowly but surely spread for at least 30 years in Assam Valley as a wave of greatly increased mortality, over 90 per cent, dying out largely as it passes on, after causing a decrease in the population. It seems to travel along the lines of communication. Though in Eastern parts of India we get a condition of Kala Azar, in Western parts we get a different and least fatal condition called Oriental Sore or a "Dehli-Boil" due to allied species of the parasites.

One gets a sore on any part of the body, it ulcerates, discharges, and finally it heals leaving

an ugly scar. Kala Azar is not unknown in the West. It is prevalent along the either coasts of the Mediterranean.

THE MORTALITY AND DREAD OF KALA AZAR

It seems to lead to a sure and fatal termination. But it is also to be borne in mind that recovery is not an exception.

It is not without reason then that it has a terrible hold on the minds of the patient and his relatives. The pronouncement of a case of Kala Azar appears to be a death-warrant to some. I have observed that relatives neglect their cases—as nothing seems more that could be done in the matter. It should not be so. With proper care in nursing and treatment we give every reasonable chance to a patient. Optimism should be the dominant note in the treatment. Early diagnosis and treatment improves a patient's chance of recovery.

HYGIENE.

Kala Azar is believed by some to be a "house-infection." No doubt many unfortunate families have got a similar experience in Madras.

It is also singular to note that many who live in perfect hygienic conditions minimize their chances of infection.

Though the Easterns might have got an adequate notion of personal cleanliness, still the same cannot be said about their general mode of living. We have much to learn from the West in this respect and it is only a general and popular education in Hygiene that will remedy many a tropical evil.

This question leads me into the heart of social matters and religious superstitions. Consequently I do not feel it justifiable to tread on these vital grounds. At any rate, it is not my object to do so in this article. The nature of general and personal hygiene of home, body and surroundings, food, water and clothing are vital elements in the transmission of diseases much more in the tropical countries. The responsibility of the relatives

does not end by administering to the wants and comforts of a patient but it begins by looking to the welfare of those around the patient. This is a problem which is a subject by itself. Hygiene is the outcome of strong common sense controlled by scientific experiences and rightly brought into practice.

In doing so one may have to fight with many deep rooted notions and superstitions, but it is worth while to give a battle for the welfare of an individual, community and a race.

Early recognition of the disease and early competent treatment are items which in my opinion will reduce a great dread about the Kala Azar.

AN IMPORTANT SUGGESTION

I may as well suggest here, that the wealthy class of Madras will do well, if only they institute scholarships or "Research Fellowships," for young and promising graduates, who have a keen desire but not adequate means, to acquire scientific knowledge. There are always unwritten opportunities for such band of trained fellows. By means of training in advanced scientific teachings under specialists, who come perhaps from time to time in Madras and who are not rare in Madras, they will not merely administer to the material welfare of the city but will contribute a valuable literature in the knowledge about the tropical diseases. A great future lies in this suggestion and there are many who cannot afford to take education on these lines in the West. If at all an advance is to be made, the sooner the better and the money spent in such an organised scheme will be more than rewarded in the long run. This affords an opening to young men, and creates in them a desire for scientific culture, which is and ought to be, in my opinion, the future of medical profession in India.

THE INDIAN MIND AND INDIAN CULTURE.

BY THE SISTER DEVAMATA.

THE profoundly subjective development of the Indian mind is not based, as so many suppose, on an innate tendency to visionary dreaming, but on acute practical observation of nature. Their science of the invisible is as exact and empirical as Western science of the natural. Their impetus towards the inner, in fact, sprang from their study of the outer. As far as they could reach on the outside, so far they travelled, observing at every step that macrocosm and microcosm ran in parallel lines. When they could move no further outward they turned inward, trusting that the same correspondence would obtain. As before, they had learned the law from the macrocosm and found its application in the microcosm, now, forced back by the illusive character of nature on the study of their own inner being, they began to dissect and analyse the microcosm and from that central point penetrate still deeper into the hidden mysteries of the macrocosm. Everywhere the analogy between the two seemed to hold. Thus it was that the first understanding of themselves came through observation of nature, while a deeper study of their own organism enabled them to discover secrets of the natural world for ever hidden from the scientist who depends upon microscope or dissecting knife.

Recognizing that they already held within their grasp an instrument more efficient than any man could invent, they set out to unfold all the inherent possibilities of the human mind, and developed a power of concentration and subjective observation such probably as has never been surpassed in this world. They surprised nature at work. They saw the great machine of the universe in motion, and were able to discover and study the relative position and function of each part. It was from the living man, the living animal

tions complete. So they moved onward, and as they watched the unfoldment of the intellectual and then the spiritual consciousness and realized that if it had taken eons to evolve a human body, how insufficient must one span of life be to evolve a soul, they gradually formulated the doctrines of Karma and Reincarnation, without which, Schopenhauer states, there can be no logical explanation of the universe. The first is merely the law of cause and effect applied not only to man's physical body, but to that subtler body of character which clothes the moral man, and the other is but the process of evolution extended to the whole of his nature and life.

Thus it was that in the Vedanta, religion and science rose from the same base,—the law of causation and evolution. And ever since they have stood firmly together as two coherent parts of one structure, never a house divided against itself. Conflict between religion and science is an unknown thing in India. As a great Hindu spiritual teacher once said to me, "The struggle for Truth on the outside is what we call science; the struggle for Truth on the inside is what we call religion." But since Truth is one, there can be no variance between them. Science is the foundation, religion is the superstructure; and philosophy is that which binds the two together, which correlates the facts of both and unites them into a complete whole.

It is this quality of completeness, of inclusiveness, which characterizes all Indo-Aryan thought. Nothing is left hanging in mid-air, nothing is taken for granted, nothing is omitted. The Hindu truth seeker in his researches realized that every fact in the universe must be accounted for. To leave out one was to render all science hypothetical. Yet to try to compass the whole realm of external phenomena was, he knew, an impossibility. Hence the only method was to pierce through phenomena to the Noumenon, to find that "knowing which all else would be known", to

leave untrammelled the diversity of nature and to penetrate to the unity behind. It was the determined effort of those ancient Vedic Rishis to find the point of unity in the midst of this infinite variety which led to their extreme subjectivity. They understood that all investigation must be concentric, that only in a Final Cause could all things meet, and seeking that, they mounted step by step the ladder of Abstract Truth until they attained heights of idealism such that Max Muller declares "None of our philosophers, not excepting Heraclitus, Plato, Kant or Hegel, has ventured to erect such a spire, never frightened by storms or lightnings. Stone follows on stone, in regular succession after once the first step has been made, after once it has been clearly seen that in the beginning there can have been but One, as there will be but One in the the end, whether we call it *Atman* or *Brahman*."

Yet they were not mere idealists, as it is too often claimed. Standing at a great distance, we see only the tallest pinnacle of any structure. So with the Vedic teaching. Looking back through the long vista of the ages the ordinary observer perceives the highest points of Indian philosophy only and characterizes it as pure speculative idealism. But those who draw closer, discover beneath those lofty towers of idealistic thought a solid edifice of science and reasons. The facts of history bear this out. It is known today that all the sciences made great strides in ancient India and some of them point to it as their birth-place. The Greeks borrowed much of their "Materia Medica" from the Hindus. Chemistry with them was a well developed science and it was from them, so Dr. Royle declares, that the Arabs learned the use of metals as internal remedies. The code of Manu stands as a model to the world of law, and Sanskrit grammar is acknowledged to be the most perfect grammar known. In mathematics the Hindus discovered geometry and the use of algebra in astronomical investigations and geometrical demonstra-

tions. It was they who gave to the Arabs the Decimal Notation, which made Arithmetic for both East and West a practical science: and later on, their great astronomer, Arya-Bhatta (476 A. D.), who is called the Newton of India, proclaimed the law of gravitation and calculated the distance of the earth's circumference.

The ruins of astronomical observatories, the records of ancient laboratory and library, show that the Indo-Aryans did not disregard the value of the empirical method. On the contrary, no modern scientist has held to it with such rigid insistence; for they claimed that it was not enough to apply it merely to the realm of outer nature, it must be carried with equal precision into the realm of religion. Experience should be the criterion of higher forms of knowledge as well as lower. Every individual, in fact, should evolve his own religion by experiment and observation. In doing this he could take as his guide any great teacher or Saviour, or he could go boldly on alone, testing the truth of their discoveries and revelations by his own. He must "prove all things" for himself, until the last theory has been merged into a demonstrated fact. Man must not be content to speculate concerning the existence of God, he must see and know Him. Mere belief in immortality will not do; while still in the body each one must find That in him which is deathless and identify himself with That, if he would become immortal. Every phenomenon of his inner being must be tried out in the crucible of experience, else for him there can be no true religion and no living God.

To make this possible was the great achievement of Patanjali, the successor of Kapila. He sought to develop in the field of psychology a scientific system of education by which man could gain full possession of that vast subjective realm beyond the reach of the senses. He saw that so long as the process of evolution was confined to the subconscious region, nature could work unhindered and carry the individual germ of life on its way in pas-

sive submission—like a child in its mother's arms. When, however, it rose to the realm of the conscious and became cognizant of itself, a self-conscious being, from that moment it must co-operate with nature, if it would hasten on its way to perfection. How this co-operation might best be accomplished was his chief study and out of it rose the science of Yoga. The word itself is the precursor of the English derivative from the Sanskrit "yoke" and signifies "joining" or "union"; and it was thus applied because the purpose of the science was to effect a union between man's lower and higher being. As nature, unaided, had borne the evolving soul from the subconscious or brute state to the conscious or human; so man must now learn to bridge for himself the chasm lying between the human and the Divine or superconscious. This, he perceived, could be done, not by going against nature, but by working with her,—taking the same processes used by her on the lower plane and employing them on the higher level.

In the West religion has been too often represented as a conflict with nature, a "striving with the Lord." Not so in India. The science of Yoga or religious practice is a natural science; not because it leaves out of account the supernatural, but because in the Vedanta the horizon of the natural is stretched to such ultra-finite limits that beyond stands the Absolute alone. And since religion is the struggle of man to "rebind" himself to God, it necessarily lies within the realm of his finite perception. Therefore religious or super-conscious development should be but the continuation of one unbroken system of education beginning with the body and culminating in the soul. Such was the system of Yoga. Through its different branches,—Hatha, Karma, Raja, Jnana and Bhakti—man was shown how he could unfold the latent powers of body, mind, intellect and heart and come into possession of his whole being. Nor are its methods any more occult or mysterious than

SIMPLIFIED SPELLING

BY

MR. J. A. YATES, M. A.

(Principal, Kumbakonam College).

THOUGH India is a land remarkable for its conservativeness, yet a plebiscite of English speaking Indians would undoubtedly result in a large majority favouring a reform of English spelling. Those who have gone through the grind of school English are aware of the enormous labour, out of all proportion to the difficulties of the language, that they underwent before they attained a reasonable facility in writing English. It is true that they were taught in the schools mainly through the eye: whereas now there is a growing practice of teaching the language through the ear. To one taught first to pronounce English words and phrases and to use them in sentences before he writes them and trained phonetically rather than ocularily, the ghastly inconsistencies of English spelling might appear a nightmare of folly. But even to one taught through the eye, with occasional excursions into pronunciation, the difference of representation of the vowel sound in *coat* and *cote* must, if he thought at all, have seemed an idle increase of his difficulties.

The statistics of Public Instruction Reports issued year by year and of census reports that come once in a decade show that the number of pupils learning English in schools and proceeding to higher study in colleges is steadily increasing. English is a necessity for administration, for trade, for political development, for all branches of study. Argue as one may that the vernaculars should be more largely employed in administration, and that debates in Municipal Council or Taluk Board Meetings should be in the language of the country, the fact remains that there are many subjects which cannot be thoroughly discussed without the

aid of English; notable among such subjects are matters of engineering and hygiene. Even when a discussion is carried on in the vernacular, a very large number of terms taken from English must be employed on the vernacular frame-work. In a Tamil discussion may be heard wholesale use of such words as 'tube-well,' 'bore-hole,' 'pump,' 'malaria' and 'enteric' by men who have read in English about the topics involved and perforce use the English terms in explanation to others whose English is limited.

There is no doubt that India wants English. Through English it can escape from the isolation of past centuries and be unified into a nation as distinct from a congeries of peoples. The facts are against those sentimentalists who would make Hindi the *lingua franca* of India. All the best thinkers among Indians want the science of the West: how else is India to develop its agriculture, arts and industries, and to make the lives of men healthier and happier? English is for India the open door to scientific study: for none of the languages of India have the vocabulary needed for scientific treatises; they are hampered too in their development by archaic rules of composition, which prevent their immediate adaptation to modern needs. All the more need is there for the simplification of English spelling, the needless difficulties of which hamper the learner.

Some would compare the conservatism of English in the matter of spelling with the conservatism of the vernaculars in the diction, grammar and spelling of their literatures. The problems are not on all fours. English has developed in all other ways than in spelling: it has changed and enlarged its vocabulary, modified its sounds and simplified its grammar. A comparison of a passage of Elizabethan prose with a piece of modern prose will show the changes that have occurred in the interval as far as the first and last points are concerned. A passage of Elizabethan prose set by the side of a passage of Chaucer's

prose will indicate even greater changes. English has had no academies proscribing these forms and proscribing those. It has changed from century to century, adapting itself to new requirements; by its means can be expressed any idea within the range of human thought. It does not bind itself to talk science with a grammar and a vocabulary a thousand years or more dead. It can express itself so that the child may understand or rise to the heights of the scientist and the philosopher. Because of its variety and simplicity and extent it bids fair to become the chief international language.

Unfortunately its spelling has remained much where it was in the seventeenth century. For this the printing press is mainly responsible. vested interests in type are against change. Again the eye has long been accustomed to settled ways of spelling words, so that incongruities seem beauties, suggesting parallels with the rough charm of uncultivated country. Further a false historic feeling has been developed in English minds; consciously or unconsciously they argue somewhat in this wise:—Our institutions are a beautiful imitation of nature; as the human body has functionless organs, that tell of primitive animal ancestry, while in other ways our frame is adapted to the complex conditions of our life, so in our social and political arrangements we keep beside our very modern institutions interesting survivals of a bygone age. In one county side by side with the county council and its machinery for maintaining roads, controlling education and providing small holdings we have the quaint custom of electing verderers from a limited body of freeholders. The verderer now has no real judicial power in the royal forests, all his powers have been stripped from him; we admit his election is a farce and his name an empty title, but it reminds us of a dead past; he is as useless as a vermiform appendix, but serves to remind us of days, when the forest

laws were a cruel reality. So too our spelling is doubtless absurd, but it tells us of the past; the gh in might has no forer, but keeps alive the memory of a time when the word had a guttural sound in it.

The argument is specious. It takes no account of the frightful waste in education that it entails. The verderer's office does no harm, but the maintenance of these relics in spelling are a burden upon the child. We have done away with the forest laws and their penalties of loss of limb, imprisonment and fines, but the penal effects of our bad spelling still remain.

The argument also shows ignorance of the history of English spelling. When the English came to Britain they had only a crude, runic alphabet; but shortly took over from the Irish monks a form of the Roman alphabet, which was nearer consistency and completeness as a record of the sounds of speech than any modification of it since the Norman conquest. Until the time of Caxton it may be said that writers of English wrote very much as they spoke. Even after Caxton's time writing, at any rate in letters, was roughly phonetic. Queen Elizabeth, for instance, wrote *deep* as *dipe*, recording thereby the fact that the vowel sound had changed from something like that in *dape* (as in *ape*) to that in modern *deep*. But unfortunately the spelling in printed books was becoming more and more fixed. It is often a record of sounds that had departed in Shakespeare's times; of pedantic pseudo-etymological spellings; of unphonetic purely orthographical devices; of false analogies, of fashionable imitations of French spelling, of foreign words spelt in foreign guises, the pronunciation being English; of foreign words spelt in foreign guise and pronounced more or less in foreign fashion. The result is such a welter of inconsistencies, as might make us wish that some thirty two inch Agastyn had presided at the birth of English or that some semi-divine Lycurgus would now reform its spelling drastically.

A few facts, drawn from Jespersen's Modern English Grammar, will illustrate what has happened.

Originally English had no symbol *k* in its alphabet. On all occasions the Roman *c* did duty for the voiceless sound which begins *corn*, *keen*, *quick*. We are indebted to Anglo French scribes for the present confusion. In French *c* had two values viz. *k* and *ts* (later *s*). Before *a*, *o* and *u* it was pronounced as *k*: before *i* and *e* as *ts* (or *s*). After some time in English writing *c* was used both in native and French words with the pronunciation *k* before *a*, *o*, *u*, *l*, *r*, and *t* (medial and final). Thus we have *can*, *catch*, *cup*, *cream*, *clean*, *act*. Before *i*, *e* and *n*, *k* was used: also finally. So that we get *cow*, *line*, *kenrel*, *know* and *think*. Before *u* *q* was used (instead of the old English *cw* both in English and French words; hence *queen* and *quiet*. But as exceptions we have *ic* finally in *critic*, *antic*, *comic*; but with French accent *antique* *critique*, where *que* = *k*. *X* was borrowed from Latin and French spellings to represent *ks* in such words as *example**, *examine**, *sex* and applied to the spelling of *six*, *fox*, *ax* (also *axe*) in native words. In Modern English *thikke* becomes *thick*, as if a compromise were attempted between the Old English *c* and the Graeco French *k*. But in *account* *cc* is employed for the same sound, which after all is a single *k* *cc* in *accent* = *ks*, following French pronunciation, the second *c* being pronounced *s* before *e*. To add to the confusion *ch* is used in the spelling of some words borrowed from Greek, as in *chaos*, *chasm*, *chorus* and in the learned re-spelling of the older *quirs* as *choir*. Except in such words *ch* represents the sound *ts*. *Ache*, was in Shakespeare's time pronounced like the name of the letter *h*, while the verb was *ake*. The verb was later given the spelling of the noun and the noun the pronunciation

of the verb. It is suggested that the latter was due to a mistaken pedantic connection of *ache* with the Greek *akkos* which had a similar meaning.

In modern English the symbol *g* has two values, as in *gum* and *gem* respectively. But here there is even less consistency than in the treatment of *k* and *c*; for while *k* is generally used before *i* and *e* initially to represent the voiceless guttural, *g* before *i* or *e* sometimes represents the voiced guttural, and sometimes the stop and fricative sounds combined in *j* (as in *jest*). Thus we get *get* and *gem*, *gill* and *gin*. *G* is a French letter which through Norman influence came into use for the two values found in French as well as in English, where a *g* before *e* and *i* had become *j*. The symbol *gu* in *guise* and *guard* is a relic of a nearly French pronunciation, viz., *gw*;* but this sound *gw* passed into *g*: still the spelling *gu* was retained and even transferred without consistency to English words, initially in *guess*, *guilt*, and finally in *tongue*.

Thus *g* was used to represent the sound of modern *j* in some words. But another device was partially employed about the time of Caxton viz., *dg* after short vowels as in *pledge*, *judge*, etc., (French words): but not consistently, for *colleges* has replaced earlier *colledges*. From French came the symbol *j* along with French words such as *judge*, *joie* and *jealous*. It will be observed that *judge* begins and ends with the same sound represented by two different spellings, the first due to a borrowing of a French device, the second to an English invention.

In old English there was only one symbol for *f* and *v*. *f* medially had the sound of *v*, hence we get *life*, but *alive* (Old English *on life*). After the Norman conquest French scribes brought *v*, which did duty for the voiced sound corresponding to *f*. But they also used *v* and *u* more or less convertibly. It was not until the 17th century that the use of *v* as the consonant and *u* as the vowel was finally fixed. In Shakespeare's plays (1st Folio) forms

* In these words *ex* is now pronounced *egz*.

† (1) See Tempest I. 2. 370. 'Fill all thy bones with aches (itches), make thee roar.'

such as *love*, *selves* etc. are employed. The arbitrary rule had sprung up of using *v* (with its modern value) initially but *u* medially. At the same time the mute *e* (a relic of old inflexions) was retained after *u* to show that *u* was *v* and not *u*! Hence no word in modern English, whether the preceding vowel be long or short is spelt with a final *v*. We are told in conventional grammars that mute *e* after a consonant shows that the preceding vowel is long. Here however is a class of exceptions, for which inconsistent mediæval spellers are responsible. Who on the face of it could tell that *love* was *luv* and *more* was *muuv*?*

The sound of *f* reminds us that pedants are responsible for another inconsistency. *Frenzy* is a popular and almost phonetic spelling of a Greek original coming through Latin, viz, *phrenesis*. From the fourteenth century onwards *ph* (a Latin transliteration of a Greek letter) was used in learned words such as *triumph*, *philosophic*, etc. Modern learned borrowings from Greek always make use of *ph* so that we get *philology*, *phantasm* (but the popular *fantom*, now by pseudo-learned re-spelling *phantom*), and *phthisis*. In the last word *ph* is silent and *th* is pronounced *t*! And in some words by some people *ph* is pronounced *p* medially at a syllable break, thus *diphthong* is *diphthong*.

To traverse the absurdities of all the representations of consonants would fill too much space. A few odd illustrations may be given. The word *nephew* is spelt as it is, because some pedant traced its connexion with Latin *nepos* (cf. English *nepotism* and *nepotist*), *ph* is a compromise between *p* and *v*! *Stephen* was formerly *Steven* (as it is in such surnames as *Stevens* and *Stevenson*), it came to us through old French *Estienne*. It was discovered that the Latin form was *Stephanus* (Greek *Stephanos*), to change *v* to *ph* was an exhibition of learning! But the spelling has not

persuaded more people than a very few *snical* souls to alter their pronunciation.

Several words in English end in *mb*; thus *dumb*, *lamb*, *climb*; but the *b* is mute. It has been mute since before Shakespeare's time. Efforts such as that of the intelligent printer of Julius Caesar III 2 225 who printed *dum* for *dumb* have failed to shift the unnecessary letter. Indeed efforts were made to attach a dumb *b* to other words which ended with the sound of *m*. Thus the Shakespearean printer in a lapse from intelligence printed *doombs* in A. Y. L. I. 3-85; there was a threatening of *solemb* (with mute *be*) for *solemn* (with only mute *n*). We have permanently, or at any rate till we reform our spelling, a superfluous *b* attached to *lim* by analogy with *lamb* (?) From Latin we have borrowed *succumb*, *b* and all; the *b* is an idle baggage.

In words such as *hasten*, *listen*, *fasten*, the *t* has been dead for a hundred and fifty years at least. So also the *t* of *often* for two hundred years. Some moderns, followers of their prototype Holofernes, would sound the *t* in *often* and *soften*. So the *t* of *Christmas* passed out of speech a hundred and fifty years ago. In words like *bristle*, *castle* and *rattle*, the *t* was disappearing in Shakespeare's time, as is shown by such spellings as *bristle* and *rattle* in early Shakespeare texts. In the modern pronunciation of *hasten* and *castle* neither *t* nor *e* is sounded. In South English speech the words, as represented by the Simplified Spelling Society's symbols, are sounded *hain*, *caast*.

False etymology gives us the spelling *cinder*, as if the word came from the French *cendre*. As re-spelt in simplified spelling *vis*, *sinder*, the history of the word—and to history the orthodox appeal—is clearly shown, actually the Old English *sinder* is found to have survived beneath the foolish *cinder*. To re-spell *soot* as *snt* is also to show its history, if any one cares for it. But who does? Historians of language are few; the users

* The vowel symbols used in *luv* and *muuv* are those of the Simplified Spelling Society.

of language are many; for the latter simplification is imperative.

Then as to the representation of vowels. Throughout the 16th century and on into the 17th the English vowel sounds were changing. *a*, *e*, *i*, *o*, *u* long had originally much the same value as the long vowels in the Telugu and Tamil syllabaries, and the short, omitting *a*, the value of the corresponding Tamil and Telugu short vowels. The modern pronunciation of the mystic five shows how far they have diverged from their original value and from the value assigned to those symbols in all other languages that used the Roman alphabet. While the vowels have changed in sound value the spelling on the whole has stayed where it was in the 16th century.

In Middle English the words *beet* and *beat* were spelt alike, viz. *bete*: each was dissyllabic; but the vowel sounds in the first syllable of each were different. In *bete* (beet) the vowel was approximately that of the first syllable in the Telugu *tsheesi*,* in *bete* (beat) the vowel was approximately that of the first syllable *tsheepa* (as pronounced in refined speech). Later on *ee* represented the first sound; but while the sound changed in the course of the 16th century to the vowel sound in the first syllable of *tsiiti*, the symbol remained and by Shakespeare's time had nearly its present value. A half-hearted effort was made in printing to find a new symbol for the changed sound; hence is in a few words such as *fiel*d and *fiend*. Meanwhile *ea* was employed to represent the open sound (as in *tshepa*) of the Chaucerian *bete* (beat). This sound in many cases before *t* and *d* became shortened into the sound of *e* in *bred*; but the spelling with *ea* was often retained. This accounts for *bread* by the side of *bred*, and for *dead*, *spread*, *read* (p pt) rhyming with *ded*. In other cases *ea* without change of spelling passed into the vowel sound of

tshee in *tsheesi* and then by a second stage into the vowel sound of *tsiiti* in *tsiiti*. Thus we get *read* (pron. *red*). *read* (Infin.) and *reed*. Pope uses *tea* as if it were *tay*; it had in his rime the close sound of *tshee* in *tsheesi*. French borrowings of a later date were spelt with the French *i*, which adds to the confusion of spelling: we have *tea*, *tee* and *ti* in *routine*; three different spellings for one sound.

In Chaucer's English the word *fol* (*fool*) was pronounced approximately with the vowel sound of *too* in *tooti*; the first vowel of the word *fole* (a dissyllable) with the open vowel sound of *too* in *took*a (as spoken). The spelling *oo* represented the long *o* sound, but after the change of its value to long *u* stood for the latter sound. In the latter part of the 16th and the first half of the seventeenth century, the long *u* sound was shortened in many words as in *good*: thus *oo*, originally for long *o*, then standing for long *u*, now represents mostly short *u*. *Food*, *brood*, *rood* and *mood* are exceptions. *Blood* and *flood* have gone one step further; in them *oo* stands for the sound of modern *u* in *but*, which is due to an unrounding of earlier short *u*.

The symbol *oa* was a 16th century device to represent the open *o* sound; but it was not used with any consistency. It was never used as the end of a word; *oe* or *o* were used instead, as in *foe* and *no*. Elsewhere *o* was used medially as in *alone*, *broke* etc. The open vowel (developed from Old English long *a* as in *father*) represented thus by *oa*, *os*, *o* in the sixteenth century has become in Southern English a diphthong the first element of which is close *o* (represented by *oe* in simplified spelling). *Oa* is still an open sound in *broad*, *roar*, etc.; its value in *goad*, and *voad*, etc., is the same as that of *oe* in *woe*.

Another phenomenon of the great vowel shift, as it is called, was the passage of long *u* into the diphthong *au* (in Simplified Spelling *ou* as in *out*). Thus Chaucer's *foul* (modern English *foul*) was pronounced approximately *foul* (in simplified

* This is the best that can be done to represent Telugu words with the existing English symbols. The English *i* is an alveolar: the symbol *i* therefore does not represent the dental and palatal sounds of Telugu.

spelling notation) By Shakespeare's time *foul* had become in pronunciation *foel* (in simplified spelling, the same almost as the modern *foel*.) The spelling *ou* (= long *u* in middle English) was a French device. It was not used consistently for this sound of long *u*. but, so far as it was, it remained as a symbol of the new Elizabethan vowel sound of *foul* and later of the modern value, approximately represented by *au* in phonetic transcription, of *ou* in *foul*. In *vound* however the long *u* sound for special reasons has remained.

But *ou* was employed to represent other sounds than long *u*. it was used to represent a short *u* on occasion as in *nourish*, where the original short *u* sound has become unrounded. And *ow* was a slight diversion of spelling the same development of the middle English long *u* gives us *cow* and *thou*. Also, besides an occasional *ou* an *o* was used for a short *u* and in later middle English it was frequently employed (*u* *u*) "in the neighbourhood of the letters *m*, *n*, and *u* (*o*, *w*). The reason is that the strokes of these letters were identical and that a multiplication of these strokes, especially at a time when no dot or stroke was written over *i*, rendered the reading extremely ambiguous and difficult (*uu* might be read also as *uuu*, *uuu*, (*uuu* or *uuu*) *uuu* (*uuu* or *uuu*) *uuu*, *uuu*, etc. This accounts for the present spelling of *won*, *son* (Old English *sunn*, middle English *sonc*) *mon*, *monley* etc." [Jespersen's *Mod. Eng. Gram.* 3-48] Thus for the past benefit of the medieval monkish speller twentieth century children are bewildered between *son* and *son*, *mon* and *mon*.

One last illustration of these 'historical' absurdities may be given. In early middle English there were two diphthongs represented by *ai* (or *ay*), and *ei* (or *ey*) used in words both of French and English origin. The old English diphthong *æ* (long or short) followed by palatal *g* became *ai* (or *ay*). Thus *dag* became *day*, *gæg*

became *gray*. Old French *deignier* gave us the Middle English *deyns*: the *ei* of the original is kept. Later however the two diphthongs coalesced into one sound and confusion of spelling arose: beside *degn* (where the *gn* is a rehabilitation of French spelling, perhaps not uninfluenced by the Latin, as in *indignant*) we got *diadain*: *peins* became *pain*; Old French *feid* became *faith* and *fei* became *say*. On the other hand *gray* became *grey*; and *forain* (*ai* comes from Old French) has like *sorruin* been given a change of vowel in spelling, and both have been falsely respelt with an idle *g*.

The history of English spelling is a very maze of tracks that lead no whither. The facts quoted above are but a small fraction of those available. The argument that our bad spelling should be retained because it shows the history of words is thoughtless and ignorant. There are many cases where the traditional spelling conceals the history; there are still more cases where it shows only part of the history. The modern word in modern speech is the last stage, and the appeal to history passes by the prime importance of the spoken word. The old spelling is a record of truncated development of popular and of pedantic superstition. Because astrology and alchemy were the crude beginnings of the sciences of astronomy and chemistry, do men argue that their falsehoods and superstitions, as well as their true discoveries, should be incorporated in modern text books? The spoken language has dropped the old significances of 'disaster,' 'influence,' 'elixir,' 'phlegmatic,' 'sanguine' and the like. Those words in their original came from the dark realms of the occult; science has taken the mystery out of them except for the few whose proclivities are atavistic. Does any one claim that for the sake of the history of these words occult absurdities should be kept alive? Those who talk of our spelling as a historical record talk with the vagueness of the occultist; in fact they do not think at all. They put

accuracy than *ng* in *finger*. The last concession to be noted is the retention of the digraph *dh* to represent the voiceless sound that begins *thus* and the voiced sound that begins *then*. It would be very easy to write *dh* for the latter, which distinction would be of considerable aid in teaching English sounds to Indian boys.

After all the scheme is confessedly a compromise, and its success with those whose mother tongue is English depends on its being such. With education to the idea of a uniform set of symbols, there may come readiness to remove some of the still remaining discrepancies. Even if these possible improvements here pointed out are not generally accepted, the scheme as it stands is so vastly more consistent than our present hotch-potch that to Englishman and foreigner alike there must result a great saving of time.

For the foreigner the historical argument can have no charm; rather, if he looks into the facts, he must laugh at the unreason of the mind that embraces it. No more can he be fascinated by the æsthetic beauty of our present spelling. If language is the chief instrument of the communication of thought, he must wonder that it is not made the most handy instrument possible. No man that could use a modern plane to make a rabbit would resort to the slower chisel. The tendency of modern industry is towards the specialization and greater accuracy of tools. Why then not treat spelling with equal commonsense? Intrinsically is *look* any more beautiful than *looc* or *niglt* than *nier*? Those who think English spelling should not be reformed because the old clumsy spelling is beautiful are not incomparable to those who insist that, because the eye in India has been accustomed to distorted figures in stone and metal and plaster, only distorted figures should still be shaped. Doubtless the Polynesian savage would prefer his hideous grinning carved coconut to the head of *Praxiteles'* *Hermes*. Yet in the latter there is

beauty and economy and accuracy. The civil and educated man would have no hesitation in his preference.

Those who pretend to find educational value in our spelling say that, even if it costs trouble to learn (and for themselves they talk of their own *miraculous ease of acquisition*) the child is born to trouble and that hard effort is of moral benefit to the infant scholar. Obviously they are of a lazy mental habit; else would they see that effort should not be spent on a Saharan waste; but that there are many ways of making productive effort; and that with the child the great stimulus to effort is interest. In India people of this kidney urge the delightful occupation once common in the Elementary schools; little naked infants sat solitary apart tracing in the sand the two hundred and fifty odd symbols of an Indian syllabary; after learning which by some three to six months daily treadmill toil they were allowed to proceed to a book; dull effort was their sole imagined interest. At least in these Indian syllabaries there is some consistency; but English spelling is a wearisome catalogue of rules, to which the exceptions are more numerous than the instances. Very significant was the title of a reading book of our childhood, 'Reading without tears'!

'Look-and-see' methods of teaching English reading laid stress on memory through the eye. It was all very well for those who had strong visual memory; for those whose ear was more receptive than the eye there was no assistance. In any case memory at the expense of reason was to be relied on. The exercise to which the child was set was as valueless as the training to which those pandits who practice *satsavadanam* devote themselves. The relationship between one English spelling and another is little more than that between a French sentence and a sum in arithmetic, which the professors of the curious Indian trick get by heart.

Simplified spelling should make an appeal both to the Indian teacher and to the Indian parent. The

time spent over English in schools is altogether incommensurate with the results. There are many reasons for this; the inadequate equipment of the teacher, the wastefulness of the methods, the badness of the furniture, and the unsuitability of the text-books. In all these matters some improvement has been made and more can be expected. But an additional reason is the time spent over the difficulties of English spelling. To get a working knowledge of simple English should, in view of the simplicity of its grammar, not be a matter of more than three or four years, provided that the teaching is 'practical' in aim. But the teacher, even if he gets his class to speak and read English with fair fluency and correctness, must spend an inordinate amount of time upon drilling his scholars in English orthography. How much easier would be his task, if he could drill his pupils in the English sounds, and for each sound had one symbol that could be used in writing whenever that sound occurred! He could from the beginning pay much more attention than he does to speech, because he would not be hampered with the necessity of forcing his class to memorize spellings in which there is no apparent rhyme or reason. Thus one of the chief present defects of teaching English would be reduced if not minimized. The possibility of oral teaching aided by the consistent symbols of the International Phonetic Association was shown clearly some few years back by Mr. G. V. Ramamurti at Parakkimedi. A class of children of different castes learnt in a year about eight hundred words of all kinds and used them in various forms of sentence, mainly because they were not hampered by our inconsistent spelling, but were taught on the principle of one symbol to one sound. But then they had to plunge into the whirlpool of inconsistencies at the beginning of the second year. Even so they mastered the difficulties sooner than a class fed from the first with illogical spelling. Their interest had been roused and they had the

sense of having mastered the difficulties of speech: their interest stimulated them to the effort of conquering even the difficulty of spelling those eight hundred words in orthodox fashion. The inference is that the progress would have been greater at the end of two years, if this difficulty had not been necessary to surmount. The statement that from one and a half to two years of the (English) child's school life are taken up by this memorizing of our bad spelling is probably true also of the Indian child who learns English. Does not the possibility of doing away with this waste constitute a claim to the moral support of India to the movement?

It must not be supposed that victory will come at once or even soon. The Simplified Spelling Society aims at the education of the English speaking world to reason. It may take a generation or two till the orthodox who have been brought up on the old spelling and in their conservatism cling to it have passed with the bad old orthography of unreason into oblivion. Generations to come will look back on our present spelling as an irrational folly, as we of to-day look on the treatment of prisoners and lunatics of a century ago; they will regard it as a superstition like witchcraft and be glad that their children are no more stretched upon its rack.

Those who are moved to know more about the Society—and doubtless there will be many—can obtain all information from the Secretary of the South Indian Branch, Mr. Mark Hunter, Binton, St. Thomé. Full members get in the year ten numbers of *The Pioneer*, a little magazine issued by the Society, and receive copies of pamphlets published from time to time.

SIR WILLIAM JONES

BY

MR. SHUMBU CHUNDER DEY.

§ SIR WILLIAM JONES in his commentaries says:—"If I am asked, who is the greatest man, I answer, the best; and if I am required to say who is the best, I reply, he that has deserved most of his fellow-creatures". This estimate of greatness appears to be the right view, for the more a man does good to his fellow-men, the higher he rises in the scale, and the summit is reached only when he succeeds in doing the greatest good to the greatest number. This success, however, we need hardly say, falls to the lot of a very few to achieve, so very hard and difficult it is of attainment. But be the number of such benefactors what it may, there is no doubt that the sphere of their action is anything but limited; indeed, it takes in a variety of subjects, religion, literature, science, arts, law, politics, sociology, philanthropy, all come within its compass and in each of these departments the selfless, noble minded worker does an immense deal of good to mankind. The subject of this short memoir is one of such benefactors, as he has largely added to the stock of knowledge by his manifold literary labours. He achieved success in what he put his hand to, and has thus secured a high place among world's noted worthies. Such a halo of glory surrounds his name that it is not likely to fade away under the withering influence of time. Jones was born in London on Michaelmas Eve, 1746. He was a Welshman by birth, but in other respects he was a thorough Englishman. He was exceptionally happy in his parents. His father was a famous mathematician, who was both the disciple and friend of the immortal Sir Isaac Newton. But Jones senior having died when little Willy was only three years of age, the care of the boy wholly devolved on his mother, Mrs. Jones was a

remarkable lady and possessed worth and intelligence far above that of the ordinary run of women; and it was to her that young Jones owed his passionate love of reading, which did him yeoman's service in raising him so very high in the estimation of the world. Jones was inquisitive almost from his birth, and it was not unoften that, even when he had not completed his fourth year, he constantly inquired of his mother on all sorts of subjects. But to these inquiries the constant answer of this gifted lady was, "Read and you will know". His unusual eagerness for knowledge, coupled with such wise inciting advice of his mother, served to engender in Jones, even when all but an infant, a very strong, ardent longing for reading.

Jones was first placed in the celebrated school at Harrow, and it was not long before he showed what an extraordinary boy he was. Unlike most of his fellows, he never spent his time in play or other amusement, and by this good and salutary habit found ample leisure for studying other books than the course prescribed for his class. In this way he peered above his fellow-students and became the Doyen of his form. Indeed, he was so much devoted to learning that one of his teachers was far-seeing enough to predict his future greatness by observing that, "if this boy were left naked and helpless in the Salisbury plain, he would still find his way to fame and fortune."

From Harrow Jones passed on to Oxford in 1764. Here, too, he highly distinguished himself and became the favourite of the professors. Indeed, his academical career was very brilliant and showed beyond doubt that he was destined to prove a great man in future:—one whose name generations after generations would not willingly let die. Jones did not confine his attention to polite learning and science; he also took in law, and read and mastered Coke's Institutes, so well-known to law students. Indeed, he attained such proficiency in this all but dry subject that the

stands almost every language in the world but his own". "Mon Dieu," exclaimed the King "then of what country is he?" "He is, please your Majesty, a Welshman."

The Judgeship of the Supreme Court at Calcutta Jones had much longed for, and he was always on the look out for an opportunity to gratify his desire. That opportunity at last arrived, and he got the coveted appointment, on which occasion he was, as was then customary, decorated with the order of knighthood, an honour which, though now fallen somewhat low, at one time satisfied the ambition of Sir Philip Sydney and Sir Walter Raleigh.

Sir William Jones * came out to India in 1783, and was duly sworn in as a Puisne Judge in the place of *Le Maistre deceased*. Before he was so appointed, he had won laurels in the field of law literature. His famous Essay † on the law of Bailments which he brought out in 1781,

* The Biographer of Sir Elijah Impey says that Jones succeeded *Le Maistre* who died at Calcutta. (Sir Impey's *Memoirs* Chap. IX). Now, as *Le Maistre*, according to the author of *Echoes from old Calcutta*, died in November, 1777, it was long before his place was permanently filled. *Le Maistre* was the very reverse of his illustrious successor. A convivial man as he was, he was a protégé of the licentious Lord Sandwich. He was also "violent beyond measure, and with Hyde opposed Impey in every thing." See *Echoes*.

† The conclusion of this discourse is simply grand, and we gladly quote it here.—"The great system of Jurisprudence, like that of the universe, consists of many subordinate systems, all of which are connected by nice links and beautiful dependencies; and each of them as I have fully persuaded myself, is reducible to a few plain elements, either the wise maxims of national policy and general convenience, or the positive rules of our forefathers, which are seldom deficient in wisdom or utility; if law be science and really deserve so sublime a name, it must be founded on principle, and claim an exalted rank in the empire of reason; but, if it be merely an unconnected series of decrees or ordinances, its use may remain, though its dignity be lessened, and he will become the greatest lawyer who was the strongest habitual or artificial memory. In practice law certainly employs two of the mental faculties; reason, in the primary investigation and decision of points entirely new; and memory in transmitting to us the reason of ages and learned men, to which our own ought invariably to yield, if not from a becoming modesty, at least from a just attention to that object, for which all laws are framed and all societies instituted—The good of mankind."

had secured him a high place on the roll of writers on English law. His was, indeed, a cosmopolitan genius. Speaking of him, the learned historian of the *Decline and Fall of the Roman Empire* says that, "he is perhaps the only lawyer equally conversant with the Year-Books of Westminster, the commentaries of Alpan, the Attic pleadings of Isacus, and the sentences of Arabian and Persian Cadhis," and he might have added, the writings of the Hindu sages of old. Surely, this is no small praise, coming as it does from one who was so very competent to pass an opinion on the matter.

Shortly after his arrival in this country, Jones founded on the model of the Royal Society of London a similar institution at Calcutta to which he gave the name of Asiatic Society of Bengal. That distinguished body selected the Governor-General, Warren Hastings, under whose protection they commenced their honorable career, to be their first President but the latter justly thinking that the founder was more competent to hold that office, with excellent taste and feeling, declined the honour in his favour, and, accordingly, Sir William Jones was installed in that office, which he filled with honour and credit till he was cut down by the cruel hand of Death. During his incumbency he by his useful researches into the history, geography, philosophy, arts and antiquities of India considerably augmented the importance and reputation of that society.

Simultaneously with the establishment of that famous Institution Jones commenced studying Sanscrit under a learned Vaidya named Ram Lachon, * and mastered this language of

* No Brahman pundit would teach a *Atlecheha* Sanscrit, and it was only after considerable toil and trouble that Jones could induce this man to become his tutor on rupees fifty a month. But this aversion of the Pundits to teaching foreigners their sacred language, Warren Hastings succeeded in removing. As Macaulay says in his brilliant essay on that distinguished Indian Scholar, "The Pundits of Bengal had always looked with great jealousy on the attempts of foreigners to pry into those mysteries which were locked up in their

languages in a few years. Indeed, his aptitude for learning languages was so very great that however hard and difficult a language might be, he could gain mastery over it in a comparatively short time. Though his principal duties were in connection with the judiciary, he directed his attention to all sorts of subjects and thereby did an immense deal of good to the cause of learning in general. Jones was a miracle of industry and perseverance, and was always bent on increasing the stock of his knowledge, thereby doing at the same time a great deal of good to the world at large. Even when Asiatic climate had told upon his constitution and he was obliged to discontinue his study by candle-light, he did not give up reading altogether. Indeed, such was his thirst for knowledge that while lying on his sick bed, he prosecuted his study of Botany almost unaided. Even when under medical advice he went on travel for the restoration of his health, he found time to compose a very useful treatise on the Mythology of Greece, Italy and India. From all this it is evident that he had so well fortified his mind that such hard labour seemed pleasure to him.

When a few days after, Jones became a little better, he resumed his judicial duties as well as his varied reading with greater care and earnestness. His friend and biographer, Lord Teignmouth † says that for sometime he resided at Garden-Reach on the banks of the Bhagirathi. It was his habit to walk to the New Court House, every morning from his quiet bungalow at

saored dialect. The Brahmanical religion had been persecuted by the Mahomedans. What the Hindoos knew of the spirit of the Portuguese Government might warrant them in apprehending persecution from Christians. That apprehension, the wisdom and moderation of Hastings removed. He was the first foreign ruler who succeeded in gaining the confidence of the hereditary priests of India, and who induced them to lay open to English scholars the secrets of the old Brahmanical theology and jurisprudence."

† This gentleman was Governor-General of India, when he was known as Sir John Shore.

that place, where he spent his evenings with Pundits and Munshees and corresponded with Johnson and Burke *.

With the closure of the Court for the long vacation his judicial labours, however, did not come to a close; but might be said to have continued still in some shape or other. During the vacation of 1787, he resided for sometime at Krishnagar, that Oxford of Bengal as it is called, where the site of his bungalow is still pointed out and is looked upon with something like religious reverence. He wrote :—" I am much pleased with my residence in this bungalow. True it is that for these three months I have had leisure owing to the closure of the Court, but as a matter of fact I have not been without work for one single moment. One's affairs in life are seldom found to be in unison with his favourite pursuits; but luckily for me my case is an exception to this rule. Even while living in this cottage I by my study of Sanscrit and Arabic † have been in a manner performing the duties of the Court. Now, I can say with confidence that Hindu and Mahomedan law officers, attached to our Courts, would no longer be able to mislead us by giving false, unfounded opinions." As Hindu rishis and sages were found to differ from one another on many points of law, it was necessary, where such reconciliation was feasible to reconcile their opinions before a definite conclusion could be arrived at in respect of them. Accordingly, Jones induced the Government of Bengal to employ Jagannath Turkapanchanan of Tribeni, who was admittedly the ablest and most erudite Pandit of his time, for the purpose. The pay of the post was fixed at the handsome sum of rupees five

* See also Cotton's *Old and New Calcutta*, p. 697.

† Warren Hastings also was a good oriental scholar. In Persian and Arabic literature he was, as Macanlay says, deeply skilled. With the Sanskrit he was not himself acquainted; but those who first brought that language to the knowledge of European students owed much to his encouragement.

hundred a month *. The old energetic Pandit took up this hard and difficult work in right earnest and, at last, produced a book in Sanscrit to which he gave the pompous name of *Vivada Bhagarnava Setu*, or "the bridge for overcoming the sea of legal disputes." This was a splendid performance and did immense credit to the learning and reasoning powers of its author. This prince of Pandits was as was his due, honoured by all, from the Governor General downwards. As for Sir William Jones he held him in high esteem and it was not uncommon that he with his noble lady honoured him with a visit at his residence in Tribeni. The famous Sadar Judge, Harrington, shared with Jones in his regard for the great Pandit, and if he found any difficulty in deciding some intricate points of Hindu law, he would take an early opportunity to come over to Tribeni and have his difficulties removed by Jagannath. Even that eminent oriental scholar, Calbrooke, † who was so well known for his Sanscrit learning, held Jagannath in supreme regard, and many were the occasions on which he paid friendly visits at his country house and held sweet, intelligent converse with him in Sanskrit on various subjects. In fact, no native was more honoured for his deep knowledge of Hindu Shastras, and none so handsomely rewarded for it. Even after he had done the work which the Government had employed him in, Jagannath, it is said, used to get rupees three hundred a month as a token of respect for his uncommon abilities and erudition.

* Jagannath had become very old, but though he had passed ninety, his mental faculties were not a whit impaired and he was capable of working as hard as a young man of less than half his age. In fact, he was wonderfully strong, both in mind and body, and he retained his strength and energies almost to the last days of his life. This was something like a miracle, seeing that when he died in 1807, he had reached the patriarchal age of one hundred and thirteen years.

† Mr. Mayne says that he "was not only the greatest Sanskrit scholar, but the greatest Sanskrit lawyer, whom England has ever produced". Hindu Law and Usage, §. 32

It would appear from some of his papers that he have seen the light that Jones's routine for work was somewhat peculiar. The first thing he did in the morning was to write out a letter, and to read a few chapters from the Holy Bible. Then he would study Sanskrit Grammar and Hindu law; while midday was devoted to the reading of Indian Geography, and evening to the study of the History of Rome; then after playing the game of chess three or four times, he would close his work for the day by reading some portion of the poem of the famous Italian poet, Ariosto. Jones was also very fond of reading *Shabnamah* of the great Persian poet, Ferdousi. In fact, his love of that grand Epic was so very deep that he would not allow a single year to pass without reading it through, just as in later times the great tribune of the English people, John Bright, would do in respect of *Milton's Paradise Lost*.

In 1788 Jones undertook to prepare a Digest of Hindu and Mahomedan law, but he did not live to complete it. The credit of bringing out the work, so far as the Hindu law goes, is due to that accomplished Sanscrit scholar, Calbrooke, who in 1840 ushered it to the public under the title of *Digest of Hindu Law*. This is no other than an English translation of Jagannath Tarkapanchanan's monumental work, *Vivada Bhagarnava Setu*, and is known as Calbrooke's *Digest*, * which is justly regarded as a *sine qua non* with every Indian Judge and practitioner. In the year following he published an English translation of Kalidas's excellent Drama, entitled

* What Calbrooke did for the Hindu law, Hamilton did for the Mahomedan law. The Digest of the one and the *Hedaya*, or guide to Mahomedan law, of the other are very valuable works and are still regarded as authorities on Hindu and Mahomedan law respectively.

In the preface to his "Digest," Calbrooke, speaking of Sir William Jones says that he "Joins to a competent knowledge of oriental language, that legislative spirit and intimate acquaintance with the principles of Jurisprudence, which he possessed in so eminent a degree."

dozen languages Jones's was a life of learned and useful labour. What Johnson said of Pope might with equal truth be applied to him, "that he was one of those few whose labour is their pleasure". Indeed, he laboured hard and incessantly for humanity, and the sweet content which he found in it had its own exceedingly great reward. In his capacity of Judge he practised those laws which it was the pride of his life to cherish and honour, and administered to his fellow creatures the pure maxims of justice and truth. The fittest and most eloquent tribute to his memory has been paid by his bosom friend and successor in the Presidential chair of the Asiatic Society, Sir John Shore, afterwards Lord Teignmouth. "At home," says this distinguished writer of his Memoirs, "Jones was always good, and abroad, he was always great. As a great man, whether we consider the perspicuity of his genius, the variety of his powers, or the extent of his erudition, we are enamoured and astonished. As a lawyer he

distinguished himself at an early age; and he not only attained a superior knowledge in the laws of his own country, but in those also of every other of the civilized globe". And he was a man "who feared God but not death, and maintained independence, but sought not riches; who thought none below him but the base and unjust, none above him but the wise and virtuous". Indeed, Jones was a very remarkable character, and deserves to occupy a high and prominent niche in the proud Temple of Fame.

Many were the means that were adopted, both in India and England, to perpetuate the memory of this great and good man. By the efforts and at the expense of the Directors of the East India Company a monument was erected in St. Paul's Cathedral; the same Honourable body also sent a marble statue of him to Calcutta. The Asiatic Society possess one bust and three pictures of its founder. But the most glorious and indestructible monument to his memory has been raised by his noble widow who printed and published all his works five years after his demise. This lady also caused a marble statue of her husband to be prepared and got it placed in the University of Oxford. In point of fact, however, such a wonderful man needs not marble or brass to preserve his memory. His works are his best and most durable monument and, as long as the world shall value learning and learned men, they will serve to keep alive his name as one of world's great benefactors. Truly does the great Bengali poet, Sri Madhusudan, say, "That man is the most glorious of human beings, whom people never forget, but to whom all ever pay divine honours in the temple of their hearts".

Not cities proud, with spires and turrets crown'd,
Nor bays and broad arm'd ports,
Where laughing at the storm, rich navies ride;
Nor star'd and spangled courts,
Where law brow'd baseness wafts perfume to pride,
Not men, high-minded men,
With powers as far above dull brutes endow'd,
In forest, brake, or den,
As beasts excel cold rocks and brambles rude,
Men, who their duties know,
But know their rights, and knowing, dare maintain,
Prevent the long aimed blow,
And crush the tyrant, while they rend the chain
These constitute a state;
And sovereign law, that states collected will,
High over thrones, and globes state,
Sits empress, crowning good, repressing ill,
Smiled by her sacred frown,
The fiend Discretion, like a vapour sinks,
And e'en the all-dazzling crown
Hides his faint rays and at her bidding shrinks,
Such was this heaven-loy'd isle,
Than Leebas fairer and the Cretan shore!—
No more shall Freedom smile?
Shall Britons languish, and be men no more?
Since all must life resign
Those sweet rewards which animate the brave,
'Tis folly to decline,
And steel inglorious to the silent grave."

This little poem is not only praiseworthy as a piece of good poetical composition, but is also remarkable for the sound political sentiments which it conveys.

The Methods of Reclaiming Saline Soils.*

BY

MR. W. H. HARRISON,

Agricultural Chemist, Madras.

IN all countries possessing a high temperature and a deficient rainfall, tracts of saline land are found in which, owing to the presence of an excessive amount of soluble substances harmful to plant growth, the growth of the crops is hindered and often prevented. Such soils in addition to these harmful substances usually contain large quantities of other substances which are essential to the growth of crops. They are therefore often exceedingly fertile when once the obnoxious salinity is removed. Consequently much attention is being paid to their reclamation in many parts of the world.

The appearance of salinity in a soil is caused in most cases by deficient drainage. This may be due to a close heavy soil texture or to the presence of an impervious clay layer in the sub-soil; consequently the most successful methods of reclaiming such soils are those which aim at inducing efficient drainage.

Probably the most effective way of dealing with the problem is to under-drain the land and then subject it to a heavy irrigation with water of good quality. The cost of under-draining land as usually practised is however high and on that account would not recommend itself to the ryot. But for small areas, such as single paddy fields, the use of bamboo drains has been found to be both cheap and effective and well within the means of a cultivator.

A cheaper method of reclaiming saline land is to divide the land into comparatively large sections by means of deep open drains, the excavated earth being utilized for the formation of bunds around

the section. Each section is flooded with water to a moderate depth and the water slowly percolates through the soil into the drains and carries with it the harmful injurious substances contained in the soil. Sometimes once flooding will clear the land sufficiently to permit a crop to be taken, but more often it is found necessary to repeat the operation several times. In any case, however, crops should be taken as soon as possible. This is because the penetration of the roots opens out the soil and assists subsequent operations. In this connection it may be pointed out that suitable crops to grow are green-manure crops. By ploughing these into the soil a large bulk of organic matter is introduced. This materially improves the drainage of the soil. Even after decomposition has taken place, the humus produced has the same effect. Dhaincha is a crop which can be recommended for this purpose. Not only is it a heavy yielder but it has the further advantage of withstanding salinity better than most other green-manure crops.

The ryots of the Kistna delta practise a variation of the above method which can be recommended. Instead of growing a green manure crop and ploughing it into the soil, they puddle in large quantities of paddy straw and thus bring about the same result. Indeed the puddling in of any short of vegetation in large quantity will answer the same purpose.

A method often employed by cultivators in South India is to cover the saline land with fertile soil by carting soil or tank silt on to the area so as to cover it to a moderate depth. No doubt with a certain expenditure it is possible to obtain crops by this method. But the causes which produced the salinity in the first instance still remain in operation and sooner or later the harmful substances are concentrated in the new layer of soil and the crops suffer. As an efficient and permanent cure this method cannot be recommended. Sometimes the new soil is brought on

* Prepared for the Department of Agriculture, Madras.

to land by flooding with muddy water and allowing the water to drain away thus leaving a layer of silt on the surface. This method combines the advantage of alternately flooding and draining the land with that of carting new soil on to the surface. It is one which may be carried out with advantage whenever conditions render it possible.

All these methods of reclaiming saline soils depend upon the presence of an efficient water-supply. This water-supply may be derived either from irrigation or from a heavy rainfall. These advantages are not available in many of the dry land areas of this Presidency. Moreover the low value of crops raised upon such dry lands excludes the use of expensive methods. Hence in these cases, the only method which may be said to be at all practicable is to dress the land heavily with gypsum (sulphate of lime) which, by reacting with the harmful salts, gives rise to substances of a less poisonous character and thus permits crops to be produced. Gypsum is, however, very scarce in South India and its use would therefore probably prove too expensive for the ordinary cultivator.

RELIGIOUS AND MORAL EDUCATION

BY

GANDIKOTA SATYANARAYANA MURTHI, B.A.

THE object of education is a harmonious development not only of the physical and intellectual capacities of the student but also of his moral and spiritual faculties. The true end and aim of all education is to unfold and direct aright the whole nature of the student. As character-building on a sound basis is the main object of all instruction, no system of education is complete which fails to take note of the moral and spiritual welfare of the pupils.

In India, all education, primary, secondary and collegiate is with few exceptions secular, and owing to the fact that the educational system

was planned by the British Government and was not the development of indigenous ideas, secularism has been pushed to its logical extreme and has not been diluted by any other influence. Not only is there no religious teaching in the Indian schools and colleges but the instruction given is solely intellectual. Those qualities which best enable men to make a successful journey of life are not wholly intellectual but moral and spiritual. One should not thereby depreciate reason and intellect. Intellect is, no doubt, a power; but like all human powers, intellect and mere intellect has her toadies and flatterers. Religion and morality are her best friends and those are her worst foes who seek to persuade her that she is superior to their authority or that she can safely dispense with their guidance. Students of the History of France will remember that in one of its fits of unreason, the French nation proclaimed intellect to be a goddess and worshipped her as such. No sooner had intellect been proclaimed a goddess than she began to behave like a lunatic and having fitted her worshippers for the mad house she conducted them all to the shambles. Such being the revolutionary tendency of wholesale intellect, it is on all hands desirable that religion and morality also should find a place in all systems of education.

In a land where morality is the mainspring of national life and education has always been religious in its character, the introduction of a purely secular system of education has been productive of the most mischievous results. The secular character of education has made the young people irreverent, disobedient and according to some Western observers, disloyal. Most people who have been brought up under the present system go through life with no higher aims than the acquisition of wealth and titles and high social position. That grim hunt for comfort which goes by the name of practicality is now becoming a most conspicuous feature in Indian life.

Learning is valued only because it enables the learner to get the comforts of life. Bishop Whitehead says, "In the evidence given before the Indian Universities Commission of 1902, witness after witness from every part of India deplored the utilitarian spirit that prevails among the students and the fact that students will not attend to anything that does not pay for the examinations."

It is therefore absolutely necessary that moral education with religion as its basis, should be imparted to students. The object of moral education problem briefly stated is that the formation of high character should become the recognised and supreme aim of all educational efforts. The appointment of a Special Committee by the Madras Government to consider and report on this problem bears testimony to the fact that the problem is one worthy of engaging the serious attention of all those concerned with the destinies of the educational world.

The necessity of moral and religious instruction in schools and colleges has been felt not merely on account of the secular character of work-a-day education but also an appeal to the history of education in our land shows clearly the intimate relation subsisting between religion and education. Long before the establishment of the Pax Britannica in this country, religion supplied the whole motive of the higher education. During the bygone Vedic Ages, the Rishis of old imparted purely out of charity spiritual and moral instruction to a number of students in their hermitages. In the Pauranic Age, the tutorial teaching of the Rishis developed into academic institutions and several pupils both adult and young were initiated into the principles of sublime morality. The Buddhistic period of History witnessed the open air preaching of Dharma. During the post-Pauranic period, the study of Nithisastra and a life conformable with the tenets thereof were insisted upon in all the head-quarters of Brahma-

nical learning. Takshasila of 100 B. C., Sridhan-yakataka of the times of Siddha Nagarjuna, Nalanda of 700 A. D., Odantapuri of the Pala Kings, Vikramasila of the times of King Dharmapala, — at all these places, there flourished famous universities, a peep into the laudable systems of which convinces one that religion and morality were from times immemorial connected with education.

As already shown, the secular character of present instruction and the intimacy subsisting between morality and education ever since the ancient times, necessitate the introduction of religion and morality into the school curricula. But, before on that account, laying down any definite scheme for imparting religious education, it is necessary to carefully consider some at least of the various practical issues raised in connection with this problem.

The first and the foremost question which has led to much divergence of opinion both in the pulpit and the press, is whether it is possible or not to divorce religion from morality in imparting moral education. The relevancy of a consideration of this dispute in the present topic is to be seen in the fact that the Government have been pledged to a policy of religious neutrality. As facts are after all facts, it is not judicious to force morality to vacate the region of religion or to compel religion to abdicate the kingdom of morality on the mere ground of state neutrality in matters religious. Leaving the question of State neutrality for a subsequent consideration, one can boldly assert that the proposed partition between religion and morality is impossible, if not absurd. They should always go together and as a matter of fact, they are never apart since they form a single organic entity. Moral education will be a ludicrous farce if once an attempt is made to separate religion from morality. Religion it is that supplies the whole motive power of morality. It holds up a lofty ideal of

worship and assimilates the worshipper with that All supreme Being Religion that says God is the ruler or upholder of moral rules is indispensable inasmuch as we are thereby induced to obey moral laws Fear of God has a deterrent force which gradually gives place to reverence and love for Him We obey the Ethical Imperative, the silent dictates of that inward monitor, the conscience first, through fear of punishment; next, there arises the more refined fear of causing divine displeasure and lastly there comes the still more refined fear of causing pain to a beloved Being It is at this stage that perfect love casts out fear as a slavish principle and leaves behind only that most refined something which is inseparable from reverential love Such being the intimacy subsisting between religion and morality, the argument of separating the one from the other cannot for a moment be maintained

The next question that demands serious attention is "How are we warranted to take up this problem when the Government have been pledged to a policy of religious neutrality?" The objectors urge that any serious attempt to institute religious and moral instruction is, in the first place, a flagrant breach of the legislature, and in the second place is bound to wound the sectarian susceptibilities of the various religions and ultimately lead to social convulsions The problem of religious education is unobjectionable inasmuch as religion sought to be imparted in schools and colleges is quite different from the religion with regard to which the Government have taken a neutral attitude Theological, and sectarian controversies which alone tend to cause social and political upheavals, can most scrupulously be avoided. When once the mischievous elements are expunged, and every precaution is taken to impart a healthy tone of religious toleration in schools and colleges, the religion of the class room will be outside the purview of the phrase "State Neutrality in matters religious." The

imparting of religious education besides being unobjectionable in the eyes of the law, is a bounden duty of the Government. It is no more unwarranted to teach morals and religion in the schools and colleges under Government order than it is unjust to embody them in the courts of procedure of the country. It is the bounden duty of the state,— and in its being properly discharged, we all rejoice,— to fix the code of morals, to frame its laws, to restrain violations of this code and to punish departures from it. Still more bounden is the duty of the Government to mould the character of its citizens by giving religious and moral instruction in its schools The reason is not far to seek. The school children of to-day will to-morrow become the adult citizens of the Empire and the school boys who are to-day amenable to the simple ferule of one school master will to-morrow be amenable to the complex Case law and Penal Code of the legislature Therefore, an imperative duty it is of the state to impart moral and religious education, and as such the objection of unwarrantedness is meaningless

The next important point requiring a sincere comment is "How can we make any system of moral and religious education palatable to the multitudinous religious sects of the land?" The chief thing in the Moral Education problem is not to fan the ever burning flame of sectarianism into a huge bonfire, but to find a common religious basis of character training acceptable to all schools of religious and "philosophic thought in India Religion shorn of sectarian stuff is a feasible factor in any adequate scheme of moral education The never ending quibblings of the Trimathas, and other controversial matters form only the husk of religion. They do not satisfy the soul any more than a feast of husks will satisfy the hunger of the body. The polemic and the sectarian sides are to religion what the husk is to the clear rice A Christian, a Brahmin, a

Mahomedan and a host of others may each have a particular name for their Highest and Most Supreme. They may even have to take different roads to get at their goals. But harmless are these outward symbols for the simple reason that symbols are after all symbols. Provided we agree even to differ in these denominational broils and provided we cultivate that deep sense of religious toleration, the keynote of all religions, we all, without any distinction of colour or creed, caste or clime have a common ground to stand, a common end to achieve, and a common interest to lead us to action. Let boys be taught to see that there are some principles which they can all believe irrespective of the fact that they belong to one particular religion or several. There is much common ground in all schools of religious and philosophic thought and that is quite obvious to all who take the trouble to enquire into the subject even superficially. We all agree that there are certain human qualities summarised by the words, kindness, truthfulness, patience, modesty, courage, self-control and the like which qualities we all admire and class as virtues. Farther, all of us, irrespective of our class or creed agree that it would be better for an individual, were he endowed with these qualities rather than with such as cruelty, insincerity, greed, vanity, cowardice or selfishness. Therefore, the allegation that it is impossible to make any system of religious instruction acceptable to the various creeds of the land is groundless.

There has been a proposal made in certain quarters that it will be well and good if the question of moral education is entirely left to the discretion of the parents and guardians of the school-going children. None can deny the wisdom of this proposal but the power of parents and guardians in moulding the character of the school children is often exaggerated. Their influence is limited by their own ignorance and imperfection, by the strength and freedom of the

will of the child and by its connection from its birth with other objects and beings. "Home Education," says Principal Paranjpye of Fergusson College, "is hardly practicable universally anywhere, least of all in our country where the vast majority of guardians of children are illiterate and have scarcely any conception of the problem." If the school children are confined only to domestic influences via the personality of a parent or a guardian, each generation will be a copy of the preceding and the progress of society will cease. But the school child is not put under the influence of parents and guardians alone and in this we rejoice. The whole universe is charged with the office of its education. Nature, society, experience are volumes opened everywhere and perpetually before its eyes. Teachers and professors trained according to the modern methods of teaching,—it is they and not the parents or guardians,—that must help the child to read, interpret and use wisely the great volumes of Nature, society and experience. It is generally the ideal teacher and not the parent or guardian that can fix his volatile glance, arrest his precipitate judgment, guide his observation, teach him to link together cause and effect, preach him right methods of demeanour in the complex turmoil of life, and ultimately turn his thoughts inward on his more mysterious nature, the nature of his self, the nature of his Atman.

It is being whispered in some quarters that the appointment of a Special Committee by the Madras Government to consider and Report on the problem of religious and moral education, is undesirable as the benefits intended to be secured by a probable institution of religious education having been secured by the existing educational curricula. It is indeed a matter of rejoicing if the objection of superfluity is admissible. And one need not hesitate to cease making any noise regarding this problem, if the existing media of instruction are productive of the

bright results of a systematic instruction in religion and morals. The opponents of the problem of systematic instruction seem to assume in the first place that they can safely kill two birds with the same stone. They hypostatise a certain something which they never care to compare and verify in the tangible reality of the school room and the lecture hall. The assumption is far from being correct inasmuch as they seek, even in spite of themselves, to identify the end and aim of a purely secular basis of education with the broader purposes of moral instruction. Secular education and moral instruction are specifically different, even though as the objectors seem to suppose, that education is after all education, be it secular or moral. It is quite plain that a man can never be called a horse simply because both are technically termed animals. So, moral education is not secular, nor secular education, moral, for the simple reason that nothing can be what it is not. When we cannot identify one thing with the other, still less are we justified in expecting the fruits of the one from the sources of the other. It is idle then to suppose that the benefits of imparting moral education can be hoped for in the basis of the present secular system. Therefore, the objection of superfluity is quite unwarranted.

Now that the need for a systematic religious and moral instruction in the class room is thus manifest, the question of the manner and the matter deserves a brief but careful inquiry. The problem of the manner is the more important of the two, since much depends upon the efficient way in which a teacher presents his subject to the students. It is admitted on all hands that whatever might be the various methods adaptable in the inculcation of various moral principles, the healthy influence of the striking personality of a teacher cannot be sufficiently overestimated. A good teacher can most wonderfully improve the tone of the boys under him in a very short time.

A gentle bearing, a profound sense of truth, a hatred for everything false or mean and a constant regard for the rights of others will equip the boys of such a teacher with a far better character than those who have been fed on daily lessons in morality and religion. It is the teachers who make the atmosphere and tone of the school, and their thoughts and aspirations will inevitably be reflected in their pupils. Unless they are inspired by pure and noble ideals and filled with spiritual aspirations, we cannot hope that our boys and girls will become cultured, refined and full of religious feeling. Let it be noted that where the best and the greatest methods of education have failed, teachers of irreproachable conduct have succeeded merely owing to the influence of their striking personality.

Apart from the personal magnetism of the instructors, a right observation of appropriate methods is indispensable for moral and religious education. There has been a great diversity of opinion as regards the reliability of either the Direct or the Indirect methods in this connection. One cannot but frankly admit that there is some truth in the charges levelled against both the methods. What with the rigid ideals kept in view for purposes of certain sham examinations and what with the particular individual temperaments of various professors and lecturers in the educational world, certain subjects of instruction, languages and History, for instance, elastic as they are, are of little or no avail even for an indirect inculcation of morality. Owing to there being no special provision for moral and religious instruction, the little scope that there may be with regard to certain subjects is being grossly abused. Besides, as there is no special provision for religion and morality in our educational curricula, most teachers will be obliged, even in spite of themselves to tacitly shirk off the credit of going beyond their bounden duty of ordinary routine. These then are the circumstances that make

the indirect method an inadequate one for inculcating morality.

We shall next go to the direct method and see what help it can render. It is certain boys are apt to neglect abstruse lectures and set lessons in morality. In fact, lecturers are very likely to forget that they sometimes talk above the depths of their young listeners. Mere sermonising and canonising will create a dull monotony and manufacture in the long run several thousands of nonsensitive automatons from out the student population of our Universities. A study of the conditions evolving the moral sense in the individual must serve to convince one of the utter futility of trying to create character by an exclusive use of hand-books of morals in the school-room. As such, the exclusive use of the Direct Method of imparting morals through lectures and manuals is unadvisable. Now, we are placed in a dilemma. The Indirect method lands us in the objection of inadequacy while the Direct method brings us face to face with the charge of unadvisability. When once we manage to tide over the Scylla of inadequacy, we are exposed to the merciless Charybdis of unadvisability. But then, we are not to generalise from this, that all attempts at instituting moral education negate the possibility of formulating any relevant method. A judicious survey of the educational method enables us to untie rather than cut the Gordian knot. Whatever might be the defects of the two methods, none can say that the methods are altogether valueless and that Psychic Methodology has become insolvent. The standing defect of the work-a-day educational system is due not to any shallowness in the Educational Psychology, but to something else. And it is nothing short of an attempt to conform the educational system exclusively to one method, Direct or Indirect. Since it is not the object of this small paper to expatiate upon the ulterior consequences of this truism, suffice it to remark that

moral education can never be successfully imparted if an uncompromising allegiance is paid to either the Direct or the Indirect Method. Each has its own merits and demerits and each has its own sphere of applicability and inapplicability. Schoolmasters of well-tried experience can feel the force of these observations however much they can theorise on platforms in conformity with the pervading hobby of the moment. Hence, I for one would like to suggest, so far as the problem of moral education is concerned, that a happy compromise of both the Direct and the Indirect Methods of both the Subjective and the Objective Methods should be made. The advantage of this compromise lies in the fact that the demerits of the one can be remedied by the merits of the other and *vice versa*. Besides, the whole method admits of further elaborations owing to the striking personality of the instructor.

Let it be noted that there are certain agencies in the educational world which if carefully fostered and coupled with a judicious use of suitable textbooks on Morals and Religion will go a great way in elevating the moral tone of the school children. Collegiate discipline, principles of a well-regulated system, obedience to authority, an insistence upon punctuality, encouraging manly and inter-collegiate sports, a sense of mutual comradeship created by associations, the inestimable value of biography and history, a zealous pursuit of accurate truth in the laboratory, the broad humanity of all good literature, a reasoned instilling of principles of ethical conduct, a deep impress regarding the principle of religious toleration, and above all the magic influence of a teacher's striking personality,—these are the various educational agencies which, if carefully nourished, will tend to vitalise the moral tone of the school-going children. But it is a point to be remembered and no teacher is stranger to the fact that any number of eloquent lectures delivered to the students on some or all of the headings in the

above list, will have little or no effect on the mind of the students. Therefore, eminent educationists of rare distinction should carefully draft a systematic syllabus graduated according to the capacities of the students of the primary, secondary and collegiate sections. The educational authorities should see that proper and suitable text books on morals and religion, avoiding all controversial topics, are written in obedience to the requirements of a systematized syllabus. His Excellency the Governor of Bombay says in one of his recent addresses on the present problem: "Provide book of moral lessons in which the atmosphere, colouring and forms of expression should be Indian. Moral training imparted during the school period would in time work with increasing effect on home life since the school children of to-day will become the parents of to-morrow." Principal Paranjpye of Fergusson College observes somewhere that the best method is to make a collection of moral verses from the Vernacular literature of the land and teach them to students. In a pamphlet entitled "the State of Native Education in 1824" written about a century back, it is stated that moral education was sought to be imparted according to a concentric system of instruction through those sublime repositories of Hindu learning, the Ramayanam, the Mahabharatam, the Srimadbhagavatam and Bhagavatgitha. Eminent educationists of well tried experience have recommended certain books for imparting moral instruction, some of which are as follow:—

1. "The Moral Life and Moral Worth" by W. R. Sorley.
2. "Youths' Noble Path" by Mr. F. J. Gould published under the auspices of the Moral Education League.
3. Mr. Venkataratnam's "Handbook of Morals."
4. Mr. M. Krishnamachariyar's "Handbook of Morals."
5. "The Girls' School year Book"

6. Moral Education Primers (Adapted for concentric system of instruction)

7. Short Histories of Great Men.

The above list, though containing books of an appreciable nature, is not at all encouraging. But one can rest assured that when once the problem at issue gains the credence of the authorities guiding the destinies of the educational world, a whole cartload of suitable text-books will be forthcoming.

In conclusion, I shall like to throw in a few practical observations which I have derived from the little attention I have of late bestowed on this trying problem and I am confident that they will be of some use to the future educationist who may attempt at something like a practicable syllabus for imparting moral and religious instruction.

The child mind being for the most part in a plastic and receptive condition, is capable of receiving such impressions as can best be conveyed by awakening the natural response lying dormant in the child. "By means of stories, examples and illustrations, moral ideas can be presented in an attractive light so that in course of time a real preference for right thought and action becomes spontaneous and instinctive."

For teaching good manners to the young, I shall like to recommend dramatic representations. The stage must be made a medium of imparting education regarding the following:— Rules of politeness towards elders, teachers visitors and strangers, Rules of behaviour in the street, in the play ground, in the public shop and lastly in the school to which the children belong. Much instruction in manners can be given by acting special plays and charades which illustrate good manners. Although children often fail to discern or be interested in the complex plot or the subtle motives of the various dramatic persons, I am sure that they can perfectly be fascinated by the manners depicted on the stage.

and it is plain that they cannot but have an impress on the general behaviour of children.

Anti-social offences can be guarded against by conjuring up a feeling of antipathy against them. *The method to be adopted in this connection is one of appeal which can be divided under various heads such as*

1. The General appeal.
2. The Educational appeal proper.
3. The Social appeal.
4. The Personal appeal.

From the Report of the Educational Exhibition held at Guntur, I quote the following brief observation upon the method of imparting religious and moral instruction:—Firstly, by instilling faith in the virtue of morality and in the goodness of righteousness. Secondly by extending this faith and correlating it to the various aspects of experience and lastly endeavouring to justify the faith in the light of reason.

The Report of Public Instruction in Mysore for the year 1908 suggests the names of a few text-books useful for imparting moral education and insists upon applying the principle of correlated teaching in co ordination with the literature or History read in schools. The Child Study Society of England in encouraging various attempts at elevating the moral tone of the school-children observes that obedience should not be inculcated through fear but that it should spring from confidence in the superior wisdom and experience of the teacher and from the love resulting from the kindness of the teacher. Prof. Nelson Fraser M. A., says in an instructive essay on "Moral training in schools" that in the Higher Forms students must receive lessons on definite public duties and learn what responsibility is.

As regards collegiate classes professors and lecturers should create in the class room agencies that can be likened to the complex turmoils of life and rationally appeal to their moral sense in showing means to successfully fight the battle of

life. Reasoned abstractions on the desirability of getting at religious toleration will not fail to convert the students undergoing post-graduate course into God-fearing citizens of spotless conduct.

In conclusion, I fervently hope that a day will come, a day when with the earnest and heartfelt efforts of eminent educationists, the best of the various attempts to vitalise the moral atmosphere of the school-world will be crowned with complete success.

Fatalism.

BY

MR. ALECK T. ELLIS.

"God made a world for each separate man and in that world, which is within us, one should seek to live."—*Oscar Wilde.*

PROBABLY no word is more misunderstood or is more abused than Fate. The narrow hectic minds of those, who circumscribed within their own limited dogma—and this perhaps through ignorance—have not even taken the trouble to investigate any faith but their own, condemn all other religions as folly, if not even sin; and for this precise reason, is Mohametism and its rock-bed foundation, Fatalism so grossly misrepresented by some.

Fate is no superstition. It is not the ignorant belief of an uneducated savage. Far from being either of these, it is the submission to the Will of God, of an intelligent being who is aware of his own insignificance in all that constitutes the cosmos, and who realises that only in the greatness of God, can a man find assurance.

Fate is the will of God, and submission to Fate is but the resignation of one's own welfare into the care of a Being far more competent to deal with it than Man himself.

What finer sentiments can a man hold than those which prompt him to say, "Father, into Thy

hands I commend my spirit," and many abusers of Fate would do well to remember that daily they profess the doctrine of Fatalism by saying, "Thy will be done."

Jesus said: "Behold the fowls of the air for they sow not, neither do they reap, nor gather into barns; yet your heavenly Father feedeth them . . . Take therefore no thought for the morrow for the morrow shall take thought for the things of itself. Sufficient unto the day is the evil thereof."

God is Great, and his greatness is more than man's philosophy, the precise reason why philosophy does not help one. So many men ask "Where is it all going to lead to?" The Fatalist is content that he does not know where "it is all going to lead to," for his trust is in God, the "Lord (who) is mindful of His own."

Let no one worry as to the hows, whys, whens, and wherefores, for as Browning puts it

" . . . We are in God's hands

How strange now looks the life He makes us lead !
So free we seem, so fettered fast we are .

I feel He laid the fetter . let it be !"

And that is what the Fatalist does he lets it lie, for again to quote Browning,

"Who knows but the world may end to night?"

And who cares? Certainly not the real genuine Fatalist

It is only by this resignation that the best in life, and the happiest in life, can be attained. Daily one makes plans, and their daily failure should surely impress upon the mind of any reasoning being, his own inability to manage even his own affairs, to say nothing of those without his immediate personality.

Indeed all are Fatalists more or less, though all may not admit it. The materialistic business man, who, if not an atheist, perhaps, may probably be an agnostic, mentions in his business "not responsible for loss by fire, burglary, or any act of God." This planner, admits the possibility of the failure of his plans by acts of God, meaning,

those acts beyond his own comprehension, or not traceable to human agency, quite regardless of the fact that all acts are of God, even if men be the instruments of His action, and man is never thwarted by his fellowmen unless they be the agents of God, and invested with His divine authority, and except by His decree you could in no circumstances withstand them. Those who have failed would do well to bear this in mind.

Very often a man who passed the prime of life, perhaps broken by grief, bowed with toils, and in many ways wounded with the inexplicable mysteries of the phenomenon of life, may look retrospectively across the vista of his days; and as he gazes back down the dark avenue of time, he says "If I had not done so-and-so, such-and such would not have happened," oblivious of the fact that it is not his to say what he will do: for, "Thus God misleadeth whom He will, and whom He will doth He guide aright"

Yet the Fatalist knows that this is not so, for God misleads none, but man in his inability to fathom the workings of the Divine Intellect, places earthly valuations upon Heavenly actions, and in consequence they appear to him, misleading

But this is not so, and very often when God seemed to be deliberately leading one of us wrongly according to our own ideas, He was leading us rightly, and later in life, it has been given to us, the Light to see this.

By reasonably observing his own utter helplessness in the hands of a Destiny—a Destiny which surely rules him by an irrefutable natural law, man could save himself much pain, yes, much great sorrow, for "every man's fate have we fastened about his neck."† Even Luther said, "Here I stand. I cannot help myself! God help Me! Amen." I do not know that he was a Fatalist; he may have been to have said that.

* Koran Rodwell's trans.

† Koran Sura XVII.

The Fatalist has a clearer outlook on life, and a broader judgment of his fellow-men. For he sees in all things the manifestations of a Great Supreme Being, whose will must be done, and whom it is *right* to submit to.

Dare any Godfearing man, be he Mohametan Buddhist, Jew or Christian say, "I do not submit to His Will"? No! And in this respect are ye all fatalists, oh ye Godfearing men.

All great, all small is governed by His will; and in the universe man is very small. He is a cog in a wheel, the wheel of life which Destiny makes to evolve, and he must act his part, and perform his function as a piece of life's mechanism, as surely as he must breathe to live, and if he do not perform his function, just as if he do not breathe so shall he cease to be.

Fate is our Ruler. Man is but a mere atom in the hands of Fate which in its turn is but the instrument ruled by the Infinite. If good fortune attend a man it is but the will of the Master. If he should receive great adversity at the hands of the Infinite, again it is the will of the Master who does all for our good. He knows so much, and His ways are so complex that we men of worldly shallow minds cannot understand Him and His great works. But a man can be happy in life whether fair or foul fortune attends him. Indeed he must take every thing as it comes from the great All Father, with "God's in His Heaven, all's right with the world."^{*}

Every Fatalist feels this deep down in his heart, *aye*, imbedded in his soul. God sent those exquisite moments of unutterable bliss; God sent those hours of misery, of mental torture, and excruciating pain. The Fatalist, reckless of his feelings, realises that he has no need to seek since "no sparrow can fall before its time, and we're valued higher than they."[†]

With a sense of something greater than gratitude, yet describable by no other word in the English language, the Fatalist recalls those exquisite moments when his whole body pulsed with that great passion of Love whose trembling is the thrill of life itself, and which revealed to him those great mysteries that only those who have loved, can know. And with no reproach, no murmur, but only a strange feeling of non-understanding, he recalls the sudden horrors and terrors, the long, desolate hours of weary, insidious pain which brought him face to face with those dread things which not even Love can efface, save momentarily.

The Fatalist does not vex himself at all, and although reckless in the sight of the "rationalist," lives his life in that world within himself, where "one should seek to live." This is the perfect spirit of Islam, and by living in this personal, individual world, a man fulfils this duty towards God and his neighbour, which is to justify his existence on the earth as a natural phenomenon.

If the Fatalist be reckless, it is because, to justify his existence as a man, he must *be a man* and not the "sensitive being" of whom Nietzsche says: ". . . . how unendurable he has now become to others, how difficult even for himself to bear, how impoverished, and cut off from the finest accidents of his soul." These "accidents of his soul" are the last things in the world that the fatalist would lose, and it is only the fatalist who can endure such accidents. By his Fatalism which is but a perfect trust in God, he can go forward into what he knows is perhaps to the Rationalistic mode of thought "hell." It becomes him as a man, ruled by a Supreme Being, and not by the conventions of a social community, to buy from life the joy she has to sell, no matter how exorbitant, bearing in mind that what the morrow may bring forth either of good or evil, is the will of God.

^{*} Browning.

[†] A. Lindsay Gordon.

Perhaps he may set himself with some emotional excitement, some sensation of the soul which makes him *live* for a week or two. The Fatalist knows at the outset, that this period of psychical excitement will be brief, and that when his bottle is broken, when the dream fades into reality, that from *life*, he will have to pass into *mere existence*.

Yet he would not be a man, if he were not prepared willingly to enjoy the weeks at the cost of the years, when some higher Power placed such emotional pleasure within his reach.

Further more he remembers, "Be not deceived! God is not mocked; for whatsoever a man soweth, that shall he also reap." That is one's Fate, and if he sow of folly, he reaps folly and submits to his fate

As an instance of this, it was a fatalist who said,

"I have made my choice, have lived my poems
and though youth is gone in wasted days,
I have found the lover's crown of myrtle,
better than the poet's crown of bays"

That is the spirit of Fatalism in which to reap any seeds age may have sown, for "Unto God belongeth the sovereignty of the Heavens, and of the Earth, and of all that they contain; and He hath power over all things"

THE TRAVANCORE CENSUS REPORT.

BY MR A P SMITH.

MR N Subrahmani Iyer, the Census Commissioner for 1911 in his Report on Travancore has accomplished his task in a singularly able manner with attention to detail and accuracy which is most praiseworthy

Travancore offers no exception to the rest of India in regard to the natural increase of the population. "Religious instruction and Social sanction alike operate towards the multiplication of the people" and marriage is not so much a "barometer of

prosperity" as a religious obligation. Mr. Subrahmani Iyer says:—"In the West people marry when the parties are sure of the means of support; here the means of support do not weigh in the question"—and in this condition of things the ultimate check to the increase of population is deficiency in the means of subsistence. Obviously, says the Commissioner, "the means of subsistence cannot be considered except from the condition and structure of the Society concerned," and it follows that the most effective way of increasing the means of subsistence is by the adoption of methods not opposed to the stability of the social structure. The introduction of extraneous influences alien to the peaceful evolution of local conditions, disturbing or destroying the requisite measure of distributory and protective service rendered equally by the producing and the consuming classes would, Mr. Subrahmani Iyer thinks, act detrimentally on the national increase and prosperity of the population. Agriculturally the outlook is hopeful, for there is still a large area which is open to cultivation and which is steadily being occupied. Industrially the state is more or less in its infancy. Here again Mr. Subrahmani Iyer is for conserving and nourishing existing local conditions. In a country where manual labour exists, wealth is more equally distributed and the physical and mental strength of the people more equally maintained. "In the case of machinery a small industrial aristocracy of affluence is formed with thousands to work under them as coolies. Though machinery has saved time and labour it has not saved men from starvation, nor has it done anything more than making the struggle for existence keener, or in other words, helping the negative forces of nature" Mr Subrahmani Iyer's deduction is that great caution should be exercised in disturbing hereditary forms of production. Only in countries with a colossal export trade is it possible for the working classes to share in any appreciable

degree in the prosperity of the capitalist. At a time when machinery is everywhere handmaid to man and the products of machinery are universally in use, Mr. Subrahmani Iyer is courageous indeed in expressing the opinions he does. It may be said that granting what he says is true, would not a country like Travancore place itself out of adjustment with all the world in maintaining an isolated position in such matters—and would it be possible to stand alone?

Let Mr. Subrahmani Iyer answer:—"Speaking generally it is no light task to make a whole nation pass from one method of industrialism to another. The difficulties in carrying out projects on the lines of Western industrialism and the complications social and economic, that must follow as bye-products, deserve adequate heed. The history of the industrial revolution in Europe is a history of the painful disorganization of labour that followed in its wake—a disorganization relieved only by the development of external commerce on a robust scale." Mr. Lovat Frazer is quoted in regard to the questions: "Is the factory system the only alternative? Can nothing be done to preserve and maintain the vast body of individual workers who are outside the factories? Can the hand-loom compete with the mill?"—as answering:—"The probability is that there is room for both and that under Indian conditions, the best solution of the industrial problem lies in a judicious encouragement of both systems... A very great responsibility rests upon the Government of India in this respect. They have to profit by the lessons of the past in other countries and to ensure the growth of industrialism in India is not attended by the evils visible in England a century ago and in Japan to-day." The final determination of the industrial policy of the country and the methods of realising it is one of extreme urgency and Mr. Subrahmani Iyer thinks that only if taken upon the lines of conserving and nourishing local conditions and by

the introduction of Machinery under very secure safe-guards is the welfare of the people possible.

Infinite trouble appears to have been taken in the Census Report to obtain statistics relating to the export and import trade of Travancore for the last 80 years, and as there is no regular statistical office it argues immensely for the way in which the figures for such a long period have been collected and dealt with. The annual average for the period 1901-02 to 1911-12 of exports is set down as valued at Rs. 24,209,000, the imports being 14,189,000 and the Revenue on land, salt, tobacco, Stamps and Registration and other things at Rs. 10,653,000. An abstract of the variations in the quinquennial and decennial averages during the last 20 years as compared with the average of the decade preceding them is also furnished and shows that great pains have been taken to indicate the condition of the country during the last 30 years. The administrative areas of the taluks in the State have been serially taken up and examined, and personal knowledge combined with close study brought to bear on the discussion of the statistics.

In regard to the differentiation of sex Mr. Subrahmani Iyer contends that many of the modern theories regarding causation of sex have been anticipated by ancient Hindu writers. Considerable space has been devoted in the report "to Hindu ideals regarding marriage." By way of general remark it may be stated that the modern tendency of matrimony in the West is, with the growing approximation of ideals and aspirations between the West and the East beginning to show themselves here as well. Although the fixity and inviolability of the marital tie, while it lasts *in jure*, are of course honored, the question that has been asked and allowed by the goateed Westerner, "why should marriage be sacramental and not Civil is attacking the no-longer unapproachable sanctum of Indian orthodoxy; and custom and sentiment bid fair to

stand in increasing measure the only barrier to its acceptance in actual life." Polygamy has never been common in Travancore and is getting distinctly rarer. "In regard to hypergamy, all that can be said is that, although a mate as high placed in society is possible, *ceteris paribus* is of course still sought, the appreciation of compensating advantages is steadily becoming more powerful than considerations of caste and sub caste."

Educationally Travancore is in the front rank and there is no need to quote figures in this connection. In ten years the number of newspapers has more than doubled, there being 45 in the State. Twenty one Malayalam newspapers have a circulation of 17,145. One English and Malayalam bi-weekly paper has a circulation of 3,200 copies. Other forms of literary activity are not wanting. Though the greatest number of publications is in the vernacular "certain conditions of abnormality have brought on a state of decline in the vernaculars." As the English language is the medium of higher education and to the study of a priceless literature Mr. Subrahmani Iyer does not consider it desirable to burden the student with a compulsory study of a vernacular language. English is becoming increasingly used in private and in public life "and the allocation of the vernacular to a place beside Sanskrit without its Classic prestige" appears at present to be the logical termination. One need not dogmatise on the effect this and similar consummations must have on the individuality of the Indian-as Indian, the preservation of which is deemed essential by Europeans and Indians alike"—says the Commissioner.

In 1875 the Hindus, Christians and Mahomedans numbered 7,364, 2,029 and 606 respectively per 10,000 of the population. In the 1911 Census the figures respectively are contrasted with 1875: 661 less Hindus and 607 and 55 more Christians and Mahomedans to every 10,000 of the population. This decline in the Hindu population is

accounted for thus:—"The degeneration of the socio-economic institution of caste that showed itself in the sequestration and neglect of the labouring classes, the indifference of lay and ecclesiastical Hindu bodies in the matter of the preservation of their faith as a living force in the intellectual and moral life of the people, the atmosphere of unsuspecting toleration that one breathes on all sides, the great sympathy and help accorded by the Rulers of the state, Christianity—the status it enjoys and last but not least the self-sacrificing zeal and devotion of the missionaries as a class—and of the pioneers in particular—all these gave vigour to the work and assured the results. There are more Christians proportionately in Travancore than in any province in India."

Mr. Subrahmani Iyer has a good deal to say on Hinduism and how it may be defined, on the early population of Travancore, on vital statistics on the disparity between the sex proportions, on bridegroom price, on real and adventitious caste and other similar questions which considerations of space prevent notice. His remarks on temples, *Samasharas*, image worship and its spiritual significance, *Razma*, Mutts etc are all of absorbing interest. Mr. Subrahmani Iyer holds the opinion that Society is to be considered in the light of an organism and that cordial co-operation among the organs in each one fulfilling its appointed function lies the happiness of Society. In concluding his thoughtful survey of the country and its conditions he mentions two cardinal suggestions—"the acceptance of Nature's ideal 'the organism' for the construction and regulation of social life, under which war and strife can no more exist among men and nations than among organs in the healthy body, and secondly a discriminating use of hand and machine labour for extra national and international purposes, by which may be prevented all abnormalities in the circulation of food or money, which is the blood of the Social organism—national and universal." The State is to be congratulated on possessing an officer of such distinguished ability and insight which no doubt will be further used in the best interests of the country.

INDIAN MAHOMEDANS AND THE WAR.

FOR several months past the Mahomedans of India have been passing through a state of discontent. The unblushing brutality with which Russia was treating Persia, the apparently unprovoked assault of Italy upon the Turkish position in Tripoli and lastly the disap-

pointment of the Indian Mahomedans over the Moslem University have all combined to create an atmosphere of restlessness among the Mahomedan subjects of the British Crown. And now, the long-dreaded 'trouble in the Balkans'—a life and death struggle between the leading Islamic Power and four minor Kingdoms of Eastern Europe—has considerably excited the already exasperated followers of the Arabian Prophet.

THE DOGS OF WAR.

[Bulgaria, Greece, Serbia and Montenegro have entered into a confederacy to wage war against Turkey on the pretext of complete autonomy for Macedonia. The Turkish press unanimously supports the Government in the face of foreign foes, and declares that the swords of heroes sharpened in the glorious battles of six centuries joyfully accept the challenge.]

[With the kind permission of the *Hindi Punch*]

Meetings have been held in various parts of India and resolutions passed denouncing the Balkan States and praying for the speedy success of the Porte. It was only the other day that the Rt. Hon'ble Syed Amir Ali, on behalf of the British Red Crescent Society, appealed to the

British generosity for funds to alleviate distress among Mussalmans in the Balkan War. More significant is the stirring appeal of His Highness the Aga Khan who in sending £2,000 from Moscow to the British Red Crescent Fund has expressed the hope that all other projects of Indian

into the arena in obedience to a concerted and well-planned scheme of action. The Servian, Bulgarian and Greek Cabinets, too, have a correct measure of their military strength and would not indulge in tall talks and bellicose attitude—the delirious war mobs notwithstanding—if they had not based their calculations on the strength of very definite assurances from other quarters. European diplomacy may stand aghast at their audacity, but not even a tyro can mistake the fingers of some of the agents of that diplomacy pulling the strings from behind the scenes. The issues of the present struggle are, therefore, big with fate. They involve the question of life and death for the Ottoman Empire in Europe.

Perhaps the day has, at last, arrived when the Turks, with their backs to the wall should fight the last fight for their existence. The fight will be against heavy odds, against treason within, implacable foes without and, above all, against the active hostility of their bigger neighbours who have been nourishing vast political ambitions to share the "Sick Man's" heritage. All this, however, seems to be inevitable. The time has, perhaps, passed when the question could be considered on the basis of right and justice. Modern Europe has ruled "the Turk" out of the pale of international morality. The question has been reduced to a simple, stark physical issue. Is Turkey strong enough to live? The sword of the Ottomans has now to give the answer. Reports from Constantinople declare that Turkey is determined "to finish with her troublesome neighbours once for all." To a nation jealous of its traditions and honour, no other determination could be possible. The present crisis has moved absolutely out of the region of compromise. The ostensible demand for an autonomous Macedonia is the thinnest of the thin disguises. The demand is, in naked fact, that the Turks should clear out of Europe. If they elect to retire into Asia of their own free

choice, even then the troubles of the Turks would not cease. The pressure of outside aggression would increase rather than diminish and the woes of a whole nation in retreat will end only when it has found a safe refuge in the waters of the Persian Gulf. The end of Turkey in Europe will be the beginning of the end of Turkey in Asia. There need, therefore, be no illusion about the challenge of the "Confederacy" with which Turkey is face to face to-day. That challenge has been cheerfully accepted. There is not a Turk who does not feel that the supreme crisis of his national destiny has arrived; and he is awaiting the future with the calm fortitude characteristic of the race. There is something impressive in the spectacle of a valiant people hemmed in on all sides by unscrupulous and determined foes, quietly pulling themselves together for a final effort to conquer or to die. Nature did not fashion the Turk on the model of hereditary bondsmen. He has been a born ruler of history—an aristocrat among nations. If, however, his rule is destined to close, it is far better he, too, should perish with his rule than live to bear the bondage of his slaves.

It is impossible at present to calculate the dimensions that the present crisis may reach. It contains all the elements of a big European catastrophe. The single-handed struggle of Montenegro will not take a month to decide. It is, however, exceedingly unlikely that Montenegro will be left alone to her fate. The Bulgarian and Servian war-dogs, that have been straining mightily at the leash, may be let loose at any moment. Within the next week the crisis is bound to take a decisive turn; and Turkey may have to deal with the combined assault of the "Confederacy." If the crisis develops no further, Turkey may confidently look forward to the issue of the impending struggle. It is, however, when she has decided the military issue and finds her insolent enemies lying hopelessly at her feet, that the real

question of the Balkan settlement will arise. Will she be allowed to enjoy the hard earned fruits of her victories? Sir Edward Grey is reported to have said that, in case war breaks out in the Balkans, every effort will be made to preserve unity of purpose amongst the Powers. Will he also endeavour to make sure, when the day of reckoning comes and the war is over, that Turkey is allowed to settle her account with her neighbours without interference or "friendly" advice from the Powers? Let the "Confederacy" have war, by all means, if it so desires—with all its consequences. If it succeeds in beating the Turks out of Europe, it is welcome to retain the spoils and divide them amongst its members. But if the Turks win and then generals hold "parades at Sofia" and other centres of the 'Confederacy,' then no sentimental charlatans, or interested schemers will, we trust, be allowed to interfere on behalf of struggling nationalities. Will the European Concert be capable of this degree of self-restraint and fairplay? All history teaches us to be sceptical. Russia will not allow her protégés, the little "Tear of Bulgaria" and the King of Serbia to be driven into exile. Austria-Hungary has her own treaty obligations to discharge by saving Montenegro. Greece—the ancient Hellas, the land of Plato and Aristotle, the sacred haunt of the Muses—cannot of course be left to the tender mercies of the Turk. The result of the struggle would be that Turkey, after immense expenditure of blood and treasure, will be left where she was to begin the struggle over again before another decade is over.

The sparks that might kindle a general European conflagration are not absent from the elements that constitute the present crisis. Austria has her own designs on Salonica, and Russia has never ceased to scheme for a territorial expansion in the direction of Constantinople. Austrian and Russian ambitions are, therefore, hostile in aim and their diplomatic manoeuvrings often come into sharp antagonism. Into this complex texture

of the Balkan problem is wrought the woof of multi coloured motives and desires that move the petty Balkan nationalities. Then there are diverse commercial interests and colonising ambitions, politic and diplomatic calculations, faddist plans and sentimental inanities. All these factors—popularly summed up as "the Near Eastern Question"—severally exert a powerful influence on the policy of every important European State. The two main European camps, into which diplomacy is organised at present, are directly interested in the Balkan developments. Efforts are being made to keep Europe united in dealing with the situation. But the curious though ineffectual rattling made by the Berchtold proposals and the recent activity of the Russian Foreign Minister serve to indicate the difficulties of Russia and Austria pulling together. The hasty bulletins that are being issued from Paris, assuring the world that all is well with the European Concert, only bring into clearer relief the enormous task of diplomacy to keep the Concert in being. When once the Balkans are ablaze, the Concert will be shattered into its elements. That this contingency is fully present in the minds of the Russian and the Austrian Cabinets is manifest from the prompt measures they are respectively taking to mobilise their military forces. There exists, therefore, a grave possibility of the Balkan crisis developing into a European conflict. England had shown every desire to respect the susceptibilities of Turkey in "the exchange of view" that took place between the Powers before the forces of diplomacy could be mobilised. We trust she will play an honourable part in settling the grave issues now confronting Europe. In the event of a European war she will find the Turks her most useful allies, while the Moslem fellow subjects of the British nation can feel no greater honour than to fight for their sovereign as well as for their brethren in faith.

The combined aggression of the Balkan States against Turkey is bound to create a profound impression throughout the Islamic world. If the Montenegrin attack brings about a general war every Moslem will feel an irresistible call of duty to help those who will have to carry on a life and death struggle in defence of their honour and their rights. The feeling would be as strong and natural as the spiritual and moral ties that unite the followers of Islam. Some mischief mongers have often tried to read into this feeling an aggressive political ambition or a burning hatred of Christendom. It is nothing of the kind. The Mussalmans desire nothing more than that their brethren should be allowed to live in peace and freedom from the aggression of the racial and religious bigots in Europe. If ever a nation possessed the right to defend its home and liberties, the Turks possess it to-day in full measure. In trying to crush the force of anarchy, organised revolt and militant "confederacies" they would be striving to preserve the birth rights of their nationality. No Mussalman, in whose breast there exists the least fraternal feeling that has been the glory of his creed can see unmoved the struggle of his fellow-Moslems in a just and noble cause. He would regard it as a great privilege if he can share actively the stress and burden of that struggle. If, however, that privilege is denied him, he would never cease to pray to his God, who has ever exalted righteousness and bated iniquity, that Right may triumph and Wrong may be trampled under foot.

King-Emperor George V. *By K. P. Kulandai-swami, B. A., L. T., L. C. P., M. R. A. S. St. Joseph's Industrial School Press, Trichinopoly.*

This is a handsome little volume of some 180 pages. The life-story of the Emperor and Empress is told in plain and colloquial Tamil narrative so as to be easily understood by the public in Southern India. It is an instructive reading to young boys and school children and is profusely illustrated.

Fiscal Freedom and Protection for India.

BY

MR. J. B. PENNINGTON, I.C.S.

In his interesting paper entitled "Fiscal Freedom and Protection for India," (page 537 of the "Indian Review" for July,) Professor Kalé says that "the advocates for protection in India are pleading for emancipation of the British Government in India from the thralldom of exploded economic theories"; and that "this departure which the Board of Agriculture seeks in the" (sugar) "industry, must be extended all along the line, if the economic and industrial situation in India is to undergo any appreciable change for the better." "This demand," he says, "is the essence of Indian protectionism, which is broad-based upon advanced economic theory and appreciation of the practical needs of this country."

Now I have nothing to say about the proposals of the Board of Agriculture as to sugar; but Professor Kalé seems to include cotton mills amongst the industries to be dry-nursed, and I want to ask him if he thinks that Messrs. A. and F. Harvey (of Tuticorin, Madura and Tinnevely) are seriously in need of assistance from the Government. From their last and former reports to their Shareholders it appears that for the last quarter of a century the cotton spinning mills managed by them have consistently paid handsome dividends. In addition ample sums have been put to Depreciation and Reserve Accounts, and all the time the Mills have been kept in as perfect and up-to-date condition as could be done,—old machinery being scrapped and new substituted the moment it was seen that to do this would pay,—Messrs. Harvey's view being that the most satisfactory results can only be attained by acting in this manner.

If a greater number of Mills were thus managed, probably we should hear less out cry for Protection; because it is clear that any one provided with capital and enterprise can do what Messrs. Harvey and Messrs. Tata have done.

SUICIDE OF GENERAL AND MRS. NOGI.

Of the many heroic figures in the Russo Japanese War no name stands in bolder relief than that of Count Nogi now made memorable by the supreme homage of death voluntarily sought by the victor of Port Arthur and his consort. History has seldom recorded a tragedy calculated to move the hearts of men more profoundly. The General was sixty three years of age when he committed suicide; and it would appear that if there was any man on earth who had absolutely no reason to take such a fatal step against his own person it was certainly he. As a military commander he was second to none in the world. The capture of Port Arthur was the supreme adventure in his life and it was in itself sufficient to invest his name with the halo of a born 'hero.' Why then did he seek this tragic end? The Count explains it in his will —

I—I kill myself to follow Him (who is gone). I am aware of the guiltiness of the act, the offence it involves is not light. But (to recall) I was responsible for the loss of the regimental standard in the campaign of Mouji (1877), and I have since then been looking for a proper opportunity to die, but without avail, and have lived on enjoying Imperial favors and gracious treat-

ment, which were undeserved. I have of late been growing old and weak with not many more days of service to live. It was at such a moment that the great calamitous event happened, an event of which I know not what to say but to be overwhelmed by its awfulness. This mind has caused me to make up my mind as how to act.

This may seem fantastic to the European mind. But it must be remembered that the late Mikado was at once the Patriarch and the Pope. Only then can we realize the full significance of the General's act of homage by death. As a writer in the *Standard* says, the tragic deaths of Count and Countess Nogi must doubtless be regarded as an instance of what Prof. Nitobe calls the symbolic sacrifice. It must be assumed that the General was mastered by a sense of the great misfortune which had overtaken his country; that he could conceive no more fitting way of symbolising a nation's grief than by offering himself as the victim of such sacrifice as in darker ages were celebrated when a great man died.

The Count in spite of his Western culture and European training in arms and discipline was essentially Japanese at heart. After the great war

he retired to his country house and lived the simple and frugal life of a country gentleman. Paradoxical as it may appear he was at once gentle and brave and the resourcefulness of his valour and intelligence was beyond all bounds. During the great war Port Arthur was, as every body knows, guarded more watchfully by the Russian General than Andromeda by the Sea Monster. An incessant shower of shot and shell, mines and bombs, pitfalls and barbed-wire entanglements and other terrible implements of death and destruction intervened between the besiegers and the besieged." And yet the Count only smiled, called it all "an expensive shell trap," and gave this stoic address to his soldiers —

Soldiers,—The task you are about to undertake is exceedingly important. I may also say that the safety of Japan and the honour of our army depend on the issue of this fight. Think of these things. Overcome all difficulties. Pay the debt every soldier owes to his country. The enemy will resist obstinately. If your commanding officers fall, let their juniors replace them. If these fall, let non-commissioned officers be their substitutes. If the non-commissioned officers fall, let privates succeed them. Whatever obstacles you encounter, fight to your last man.

The General served his country in several campaigns against China. He lost his two sons in the recent war and cheerfully marched to take their places in the battlefield. A striking picture of the lonely and bereaved man is given in the following impressions of an Englishman :—

Out of the gloomy tragedy one figure stands clearly isolated in picturesque sadness, pathetically robbed of all earthly happiness yet invested with a conqueror's mantle. During the many dark weeks of the long siege, silently wrestling in the despair of defeat, with moanings of thousands of souls, passed away at his bidding, eternally tearing at his heart-strings—when others were at rest, and believing himself alone, Nogi would let the restrained tears flow unheeded from his bowed head, and pray that some sacrifice would be inflicted on him to atone for their sacrifice. One son had been taken from him, and during the blackest of the dark days, when all seemed hopeless, the second son perished at 203 Metro Hill. And when the bitter news was told him he showed no passing shadow of the great cloud that had come over his life. He was now heirless, and his bereavement answered the clamouring souls of the departed men he had, by unhappy duty, sent to their death. And through the stress of those days he would always greet you with a smile, come into your humble broussac, share your food, and offer you little pieces of chocolate he seemed always to carry in the breast-pocket of his uniform, would

enquire about the water you had to drink, send you half of a basket of fruit sent to him by his wife, and never a passing word would betray the deep anguish of the father.

"If I were a Japanese," wrote Sir Ian Hamilton who had special opportunities of knowing the man, "I would venerate Nogi." So do the Japanese venerate the late General. He lived and died a Samurai, one of the greatest of the world's heroes and one who by a single act of heroism created a landmark in the history of modern civilization.

Current Events:

BY RAJDUARI.

THE WAR IN THE NEAR EAST.

“WAR, horrid war,” has at last been declared by the “small neighbours” of Turkey—a veritably Liliputian group, brave of word, and braver still of their respective mountain bravery, who, tired of the frequent procrastinations of the Sublime Porte, have, in defiance of the counsel of the Great Powers, rushed forward in an hour of bellicose spirit, to try conclusions with the Brobdingnag of the Near East! Never before, in these modern times, was war declared in so theatric fashion as that by the Montenegreins who have been rather absurdly compared to our Indian Rajputs, the lineal descendants of a long line of heroic men deriving their pedigree from the dynasties of the Sun and the Moon. Mountaineers are ever known to be brave. The hard conditions under which they live, move and have their being are alone sufficient to make them hardy and ingrained to bear all hardships, physical and political. No wonder the population residing in the mountain fastnesses and the valleys below of the Horns of classic Hellas or the Balkans of modern Europe should at times be on the war-path. Being human

and blessed or cursed with human passions and human verities, it is impossible that surging with sullen resentment and bitter disappointment at the conduct and action of a strong Government but absolutely behemoth like in its ways, they should once for all resolve either to return with the shield, like the Spartans of old, or die with it on the battle field. Patience seems to have been exhausted. When that is the condition of vast conglomerations of militant humanity, exasperation or desperation follows. While in that mood not the best of counsel, the wisest and most practical, can prevail. When the war spirit is on, and the trumpet is blown, it is impossible to resist it. Thus, it has happened that the Macedonian, the Montenegrin and the Servian have resolved, out of sheer desperation, to cast the die and take their chance. Turkish dilatoriness in executing the reforms contemplated by one of the clauses of the Berlin Treaty of 1878 is synonymous with procrastination. There is not a country in the civilised world which can rival Turkey in her dilatoriness which is unique and unparalleled. She is the very embodiment of the policy of drift. Leave things where they are and trust to the chapter of accidents—that is the motto of her governing authorities. It is this policy which has sometimes saved Turkey, but which has not infrequently brought untold woes on her, wars and loss of precious territory, bit by bit, included. The Macedonian cannot be blamed. Indeed he is much to be commiserated. It may be that "atrocities" in the past, though they have not been all one side, have sickened and enraged him. It may be that help less to fight a Sovereign Power which has held its own these six hundred years past, he has often invoked the assistance of external but far from disinterested friends. Macedonia can reasonably claim the sympathy of the outside world, though on her part she has not been quite the immaculate and the innocent which her interested friends would have us believe. Exasperated and enraged,

the Macedonian is justified in revolting against Turkey. But it is not so intelligible to find a cause of justification on the part of the Servian and the Montenegrin. But casting aside the history of the last 34 years, let us survey the situation as it presents itself to us to day. In practical politics, we have to face existing facts. What then are the facts? These. In the first place, the European "Concert," as it has been called, has hardly been true to itself or to the cause of the struggling nationalities which have groaned under Turkish misgovernment. Appeal after appeal has been made during this interval of 34 years but to very little practical purpose. It has dismally failed to discharge its solemn trust, namely, to ensure permanent peace, on a sound footing, to the population of the Balkans, brave, impulsive, but helpless to wage a successful war by themselves against their oppressors. The concert has never acted in concert, whatever may be the outward appearances of unanimity. Internally, the concert is a house divided against itself. There are selfish interests within. These interests have no doubt to succumb to the moral pressure of some less selfish. Again, each one has all through been conscious of its own political weakness, that is, of its inability to settle the difficulty by the arbitrament of arms singly and exclusively. Divided interests and conscious imbecility—these alone have been the principal features within. There is a rift in the lute. That is the reason why the concert, whenever invoked or appealed to, has never been able to effect a satisfactory and lasting condition of affairs in the Balkans—such as to ensure that greater object, the peace of Europe herself. At the best, there have been a series of patch work compromises. Is it a matter of surprise that every five or seven years the Balkan politics threaten the peace of Europe, which Europe, in her own interests, has but feebly striven to maintain? Armed truce or armed neutrality—that has been the con-

arrived at. Though the new diplomat at St. James's Court may not realise all the anticipations which were expected from the sympathetic and more experienced Bibberstein, still there is the chance that he may be able to bring about such a friendly understanding touching naval affairs as may allay all the fire and fury needlessly spent for months past.

Thus while the Navy is being fairly cowed for by the erratic but versatile son of Lord Randolph Churchill, Lord Roberts is still foaming at the mouth, as age advances, with regard to the utter worthlessness of the British Army. It is indeed a sight to behold this aged man of eighty, and a Field Marshall to boot, unburthening himself about the British forces in so desparaging a manner. Is the Army so rotten as only to improve when the nation resolves upon conscription? Assuming that conscription is resolved, will the Army be efficient and every way prove a better "machine" than at present? Not many are the capable Generals in the army on whom England relies in her dire emergency to share the views of this veteran Cassandra and the pampered pet of the hair-brained military. Lord Roberts is a disappointed Soldier.

The Farkenstein of the Physicians is slowly disappearing. The faculty is appeased by the generous *calaisis* which the Chancellor is willing to grant. Meanwhile trade still shows an upward movement to rejoice the heart of the Chancellor, while the "backwoodsmen" of the gilded Chamber impotently bark and bay at the Land-tax.

King George had amused himself with his red chess-board pawns at the recent manoeuvres and was considerably delighted at the scientific exodus in the air of the numerous air-birds which aeroplaneing has brought into existence for both weal and woe in the near future of international warfare.

THE CONTINENT.

Mon. Poincaré has returned from his pilgrimage

to some of the potential potentates of Europe self satisfied that all goes well, and will go well, with France. And as he is on the side of peace none of the portentous threats held out by the "small neighbours" of the Osmanli have any influence on his well balanced mind. He has calmly surveyed the situation and felt that the war-clouds would soon disperse themselves, specially as Italy and Turkey have embraced each other and shaken hands. History will have now one more Treaty of Peace of importance to record after the last one christened the "Treaty of Portsmouth" which arbitrated on the events of three years ago in the farthest East. The latest is the "Treaty of Lausanne" whereby Tripoli is ceded to Italy and whereby Italy gives back the *Ægean* Islands to the Ottoman and provides certain indemnities and obligations. The treaty is regarded as mutually satisfactory and so the world of peace need hang no further comments on it. Neither much value be put upon these modern parchments breathing truce and brotherhood. Treaties, modern treaties, are made only to be torn. No great Power has yet been known which has conceived a treaty in its altruistic aspects, a real guarantee of amity and good will. A breath makes a treaty as a breath unmakes it. Being of the earth it is earthly, so let us relegate to the limbo of things mundane this latest piece of parchment.

Austria's eyes are on the Balkans just now and the eyes of continental Europe are all on Austria. She watches the cockpit of Europe with a double conscience which is scarcely approved by true lovers of peace. Meanwhile at home Austria Hungary is a divided house. During the month some very discreditable and painful scenes were enacted in a place which by common consent is regarded as sacred as a temple or church. The Hungarian Minister fell out with some hot-headed Hungarian deputies. As

a result there was the undignified and vulgar spectacle of the cock fight one sees in the street. Twice did these men of fire and brimstone come to fistouffs and black eyes and twice the parliamentary gendarmes had to be called in to disperse these Civil *franc-tireurs* in the Hungarian House.

Complaints of further enslaving Finland are appearing in the papers. Lately a most respected Finnish Judge has been arrested and imprisoned for having refused to accept a law passed by the Duma for being administered in Finland. The Judge was perfectly constitutional and within his rights; but it did not suit the autocracy and so the fate of the Judge for the time has been sealed. Slowly and by degrees the Finns are being reduced to the same state of slavery and subjected to the same despotic rule that prevails in "Holy" Russia. There is, again, a distinct sign of swallowing Sweden in pursuance of which object the navy is being strengthened in the Baltic and strategic railways are being constructed on the border dividing Sweden from Finland. The inoffensive and peace loving Swedes are, however, wide awake. They are strengthening their shore defences, increasing their navy, for which a special vote of a million and more was cheerfully given by the Swede Parliament, and otherwise making all preparations for a bold resistance. Thus the holy autocracy is fumbling north and south, east and west, for outlets whereby an open sea board may be reached to carry on trade. The octopus is for ever distending itself forgetting that Nature punishes those who artificially endeavour so to stretch themselves. Meanwhile in the Pacific she is making friends and entering into secret alliances for offence and defence with her whilom enemy, the Japanese. That nation, too, is bursting with Imperialism and is growing greatly ambitious. Mongolia and Manchuria are her objective. But as she cannot swallow all, she has had to divide it, in course of time, with

the Muscovite. All these are unnatural alliances. It is more than doubtful whether Tartar and Mongol can co exist on terms of amity for any length of time.

PERSIA AND CHINA.

The state of Persia is no better and no worse these last few weeks. The latest rumour is that the ex-Shah's brother is marching on Tehran with a few hundred troops and guns. If he really means an invasion, it is evident that he is doing so with the support of Russia from behind—that perfidious Power which will never cease its intrigues, overt and covert, till the unhappy country falls at her feet. There is also another rumour that there is every likelihood of reinstating that wretched monarch, already deposed. The Persians are in a state of alarm. They are growing wholly suspicious of the *bonafides* of the British Foreign Office which for months is humiliating itself before all Europe by playing into the hands of its so-called friend, the Russian. Sir Edward Grey has repeatedly declared that he would never tolerate the reinstatement and yet, so declare the Persians, every single step that Russia takes in North Persia indicates which way the wind is blowing. The pro Persian party in London, suspects that a new sensation is in store for helpless Persia. She will be wholly thrown on the tender mercy of the Muscovite wolf as England means to resign all responsibility and all interest in the affairs of Northern Persia. Under the guise of a new commercial railway a free zone of "influence" and "interest" is to be agreed to, if not already agreed upon, since Suzouloff's return from Bismarck, the object of which will be a clear partition of Persia. Once England renounces her responsibility for the independence and integrity of Persia under this secret agreement, there will be nothing to prevent Russia from seating the ex Shah once more on the Persian throne, while her emissaries are behind doing the real work of government. In short the

story is that the ex-Shah will be *rod jaineant* while Russia is the real *Mayor of the Palace*! What next?

Meanwhile China is forging ahead. She has most adroitly heaped coals on the head of that misguided Foreign Minister, Sir Edward Grey. China desired a loan of 60 millions, and the British Foreign Office agreed to advance the sum on certain drastic conditions, along with five other Powers namely, the United States, France, Germany, and *mirabile dictu*, Russia and Japan. The Six Powers were agreeable to oblige China by giving the loan, provided she gave in security the salt tax which was to be collected and controlled by their own emissaries. The statesmen at the helm of affairs at Peking flew into a rage. Their patriotism was aroused and they flatly refused to have any thing to do with a loan on such terms—terms which practically meant her being fettered and interfered with and eventually partitioned off. The monopolists of finance behind the Six Powers did not know what Yuan Shi Kai was capable of. They did not know, till it was an accomplished fact, how they were “dished” and how the big slice of the Chinese melon was not allowed to be eaten in the complacent manner they had wished it. There were other financiers, not under the thumb of the Foreign Office, who were prepared to give a preliminary advance of 10 millions *without any security at all*, they relying on China's own credit alone as their best security. With rare courage the sturdy and independent spirits of the London Stock Exchange moved in the matter. With the aid of Mr. Crisp and Lloyd's Bank they formed another Syndicate, and after binding down the Foreign Office by their own diplomatic ropes, they floated the loan at 95. It was speedily taken up to the utter chagrin and dismay of the group of the official sharks. The Foreign Office was given a disagreeable foretaste of what the independent London Stock Exchange could do. There is gnashing of teeth and rending of hair. All the same Crisp & Co. are triumphant

and Yuan Shi Kai is happy in the thought that for once the Tartar has caught the Teuton by the throat and made him learn a lesson on financial diplomacy. England is humiliated before the world and well she may. She was humiliated in the matter of Persia and now China has done the rest. So long as they have a minister of the waxen character of Sir Edward Grey nothing better could be expected. More. The financial world is amazed why Russia and Japan, above all, should have been introduced into the company. What state had they to deal—these impecunious and hungry sharks who are living from year to year on the bounty of England and France and otherwise rearing huge armaments for the destruction of of these very lenders. Can habitual borrowers lend any monies to China? If not then by what right they would have the privilege of controlling the loans? Verily, the world is astonished at the financial unwisdom of England and the utterly contemptible character of her diplomacy as carried by her Foreign Minister the like of whom has never before ruled in Downing Street. It remains to be seen what fresh dramatic developments arise out of this first Act of the Chinese Loan drama. Well the defeated commit further suicide while endeavouring to revenge themselves for the humiliation they have undergone? Wait and see!

The Self and its Sheath. *By Mrs. Annie Besant. Published by the Theosophical Office, Adyar, Madras, (2nd Ed 1912)*

This well known series of Lectures by the talented lady who presides over the Theosophical Society have always been very much appreciated, and it is no wonder that it has reached a second edition. The idea of the Sheaths or *Koshas* of the self finds its expression in the *Ananda Valli* of the Taittiriya Upanishad and in some other Upanishads. In the lectures before us, the same is expounded beautifully in the felicitous words of the author, with numerous quotations from the Upanishads in illustration.

THE WORLD OF BOOKS.

[Short Notices only appear in this section.]

A Beginner's History of Philosophy By *H. F. Cushman, M. A., Ph. D.* Vol. I. *Ancient and Medieval Philosophy*, Vol. II. *Modern Philosophy*. George G. Harrap & Co., London.

This is a sound text book on the History of Philosophy. The author has taken great pains to make the subject thoroughly intelligible to the students. He has made use of maps, summaries and tables for the purpose, and has employed the student's historical, geographical and literary knowledge for throwing light on the rise and development of philosophical doctrines. He says, "the only 'memory hooks' upon which the teacher may expect to hang philosophic doctrines are the student's ideas of history, literature and geography ... To isolate the historical philosophical doctrines is to give the student a wrong historical perspective, since philosophic thought and contemporary events are two inseparable aspects of history. Each interprets the other, and neither can be correctly understood without the other." In the first volume, the author treats of Ancient and Medieval Philosophy. The major portion of the volume is taken up by the former, and the treatment is full, clear and systematic. The doctrines of each philosopher are concisely and clearly given. There is a beautiful correlation of philosophical doctrines with historical facts. The controversy between Heraclitus and the Eleatics regarding the problem of change is rightly spotted as the earliest presentation of that central problem in Metaphysics. The Philosophy of the Middle Ages is also dealt with in detail.

In the second volume, the author treats of Modern Philosophy running over a period of about 450 years in a manner that does not lend itself to much criticism or depreciative estimate. How the philosophic reaction against Scholasticism was maimed and crippled in its early beginnings

is described by our author in a humorous way. Descartes is described as having spent his whole life, "trying to trim his sails that he may not offend the Inquisition." Spinoza is said to have saved himself "by living in obscurity and publishing nothing." Our author has nothing to offer by way of criticism against Spinoza's application of the geometrical method to philosophical problems. He thinks that the religious conviction of Spinoza that all things come from God necessitated the employment of the Deductive method. The philosophical speculations of Descartes, Spinoza, Leibnitz, Locke, Berkeley, Hume and Kant, are dwelt upon at considerable length. The German Idealism as represented by Fichte, Schelling and Hegel, also finds a place as constituting the main line of development of the critical Kantian movement. Hegel, however, does not receive at the hands of our author the attention that is due to him. Green, Bradley and Bergson are left out altogether, and no mention is made of the Pragmatic movement. On the whole, we are of opinion that the book is a sound text-book, and ought to be in the hands of every student of Philosophy.

English Literature of the Nineteenth Century By *A. J. Wyatt and H. Clay*. (University Tutorial Press)

The supply of handy College manuals for the purpose of the study of literary history is no easy task, but the University Tutorial Press has always very effectively administered to all educational needs in this direction. The necessity for specialisation is being felt in a more and more pressing manner day after day, and it is quite essential to place a manual of this type for use in class. The account is sufficiently exhaustive, without burdening the student with unnecessary details and the authors have paid special attention to the critical aspect of their work as literary historians. A very successful attempt has been made to bring out the characteristic features of each writer's genius and work.

September 30 At a representative Meeting of the Mussulmans of Behar held to-day under the presidency of Khan Bahadur Mahboub Hussain, Barrister at-Law, it was decided that the Nawab Ittāf Hussain Sihab and the Hon'ble Moulvi Fakuruddin should work as President and officiating Secretary, respectively.

October 1 The Hon'ble Mr Hailey arrived at Delhi to-day to inaugurate the new Chief Commissionership, which came into existence this morning.

October 2 A security of Rs 500 has been demanded from the Hindi journal, *Nat Dharam Prakashak*, on the transfer of the press and paper to Delhi.

October 3 Mr Montagu, Under Secretary of State for India with his brother Mr L. Montagu, and Mr. Peel, Private Secretary, left Victoria Station for the P. and O. as *Malaya* this morning.

October 4 The ceremony of laying the foundation stones of the King Edward Memorial Hospital and Municipal Dispensary was performed by H. E. Sir George Clarke this evening at Poona, before a large and representative gathering.

October 5. Mr Gokhale left England for South Africa to-day to examine the question of Indians in South Africa on the spot.

October 6. The Hon'ble Pundit Madan Mohan Malaviya to-day addressed a large and representative meeting of Hindus presided over by Lala Har Kishen Lal in Lahore relating to the Government *communiqué* on the formation of Universities.

October 7. Mr T. Palit, to-day executed another deed of gift of Rs 7 lakhs to the Calcutta University for founding a College of Science.

October 8. *Montenegro* has declared war on Turkey. Heavy fight is taking place.

October 9 War is still raging and there is great commotion in the continent. The Powers have issued a Note on the crisis.

October 10. The Managing Committee of the Bombay Central Famine Relief Fund held a Meeting to-night to wind up its affairs.

October 11 It is announced that Colonel Cody has agreed to attempt a flight to India on his biplane which won the Government's prize.

October 12 The Right Hon Syed Amir Ali, on behalf of the British Red Crescent Society appeals to British generosity for funds to alleviate distress among Mussulmans in the Balkan war.

October 13 A public meeting was held this evening at the Bradlaugh Hall, Lahore, under the presidency of Mr Hari Kishen Lal to mourn the death of Mr Hume.

October 14 A mass meeting of the Mahomedans of Calcutta and the suburbs was held this evening to appeal for unity among Muslims and ended in a prayer for Turkish victory in the war.

October 15 It is announced that a socialist shot Mr Roosevelt in the street near his hotel but the aim missed and he is unhurt.

October 16 An enthusiastic welcome was given to Sir James Meston who arrived at Lucknow to-day.

October 17 The death is reported from London of Mr E. M. Slater, the Managing Director of Messrs. Tata, Limited.

October 18 At the Punjab Hindu Conference, at Delhi, resolutions were passed thanking the Government for the change of capital and such other boons of the Durbar.

October 19 The Punjab Hindu Conference concluded its sittings to-day. It was resolved to establish an All India Hindu Association.

October 20 At the Anjuman-i-Islam School, Bombay, a large body of Mahomedans resolved to collect donations for the support of the wounded in the Balkan war. Over Rs 10,000 was collected on the spot.

Rebirth and Karma

A striking article is contributed to the *Hindu Spiritual Magazine* by Dr. J. M. Peebles, the well known American Spiritualist on the Hindu theory of Rebirth and Karma. The writer vehemently opposes the theory. He cites various authorities in support of his contentions and is emphatically of opinion that the doctrine of re-incarnation is not based upon a single demonstrated fact in science —

While I hold in profound admiration the Hindus of the Orient, I absolutely loathe and detest the theory of re-births and re-births that bring our resurrected spirit friends back from the spirit world into this world of flesh, temptations, and mercenary competition.

(1) Re-incarnation is not based upon one solid demonstrated fact in science.

(2) It degrades the conscious spirit by bringing it rotatively back into the paralyzing meshes of gross matter.

(3) It stupifies or virtually annihilates memory, during long periods of Devachanic dream life.

(4) It sets at defiance the great immutable law of evolution as accepted by the most learned of the world.

(5) It violates every law of zoology such as progress of mineral to vegetable, to animal, to mankind, to spirit in the spiritual world, looking up to the celestial spheres and thus onward and upward for ever.

(6) It is unjust and vindictive enough to punish, in connection with Karma, souls in this world for sins committed in a previous incarnation, and of which they have no recollection.

He is everywhere asked the stereotyped question: If God is just, why are some souls born into the homes of the poor and others into the homes of palaces? This implies the thought of absolute monotony. If all souls were born into this world under the same happy conditions, there would be no work for reformers. Personally he was born into the home of extreme poverty, struggling through these adverse circumstances up to the present plane of consciousness, has made him strong and morally courageous for the promotion of truth and righteousness. Regarding theosophy and spiritualism he says:—

While Theosophists speculate, Spiritualists demonstrate. At one time, there were four schools or sorts of Theosophy in America. Now there are but two; the one is run by the Rosant devotees and the other by the Tingleyites, and they are about as harmonious and they love each other about as devotedly as Roman Catholics love Protestants, whom they consider heretics and without the pale of salvation.

The Indian Financial Outlook.

The *Investors' Review* deems it advisable to call attention to certain features of the financial situation which it regards as perilous:—

Thus it is true that India does make progress in some ways, and the Indian people are being treated more humanely by the British overlords than they used to be, so that their future is more hopeful than it was even ten years ago. If we could get the outlay on the army brought down from the £20,000,000 odd it now reaches to a bearable figure, and some of the money thus saved devoted to public improvements, to pay for education, to nourish industry and open up new markets for Indian products, we should be able to speak much more hopefully of the country than is now possible. As things are, the capacity of the Government to carry out reforms in education and in public improvements which the Government meditates depends wholly upon the rainfall. There is no surplus to fall back upon in the event of two or three years of short monsoons or drought, either in the hands of the Government or in the hands of the people at large. The moment scarcity comes, relief camps have to be opened for the masses who are hungry. That cannot be a healthy state of affairs, and when in addition we contemplate the artificial state of the circulation of silver rupees—the only effective metallic coin the country has—at an artificial valuation; when we see likewise that the entire currency reserve supposed to be put aside in order to buttress and solidify this artificially valued currency is kept in securities on this side of the globe, it is impossible to avoid the fear that the budget show exhibited so eloquently by Mr. Montagu will have its reverse side by and by, and that times of strain and difficulty, of recoil, will again change the outlook and once more warn us that the Government of India involves us not only in great responsibilities, but in great dangers as well.

The New Woman of India.

Sir Bamfylde Fuller, formerly Lieutenant-Governor of Eastern Bengal has been re-visiting India, and says some interesting things about it in a recent number of the *Nineteenth Century*. He says that traditional custom has been but little affected by the study of English.

During the past half century we have seen that youths can pass by thousands throughout schools and colleges, learning our language, studying our literature and our science, but not imbibing from either the least effective desire to change their habits. The force of environment is much more compelling; and in India, as in Turkey and China, reform has been the outcome of residence in the West.

The writer continues that perhaps the most fruitful of reforms would be the emancipation of women. In India the functions of women have been limited to those connected with reproduction, whereas in Western countries their enormous influence has been exerted upon the environment and development of the peoples of Europe. He distinctly realises the change that five years have wrought upon the minds of the people. While he was in India he knew very few women who ever dared to come out without the purdha. And even these belonged

to the small sect of the Brahmo-Sams, with whom the education and emancipation of women has been almost a point of religious doctrine. One may now perceive a deeper current. A Hindu revivalist movement—the Arya Samaj—which is of rapidly growing influence in the Punjab, opposes itself strongly to child-marriage, and is convincing its disciples that a girl should not be a wife until she is at least fifteen years old. In this case, girls could stay at school until they had acquired some education; their education is strongly insisted upon, and even married women may be found attending the schools of this sect.

But now the case is different. The Parsi ladies have already been emancipated. Among the Mahrattas and the people of the Punjab one may notice a growing desire to widen the women's outlook.

After making these observations he concludes:—

It must not be supposed, however, that the Indian women are sighing for liberty. In most cases she needs urgent persuasion to relinquish her veil. But she appreciates her liberty, and in Western India some ladies' clubs have been formed where ladies of education can meet of evenings at badminton and tennis, and even at the bridge table. Reform will come slowly for its path is thickly set with pit-falls.

The Lords of Islam.

The current number of the *Review of Reviews* contains a vigorous article entitled "The Lords of Islam." The writer contends for an Anglo-Turkish *Entente*. For good or for ill, says he, the destinies of the British Empire are closely bound up with the rise or fall of the Turkish Empire. He says that England should be as anxious for the welfare of the Sultanate as any Turk or Mohammedan in any part of the world.

Of the whole known Mohammedan population of the world the British Empire contains over 100,000,000. We are the greatest Mahomedan Power, and in our Indian and African possessions we have given hostages by the millions to the Caliph for these British followers of Islam from the most positive portion of the inhabitants of the various territories of the Empire. Islam is a religion which breeds positive followers, and therefore we may assume that the hundred millions of Mohammedans under the British flag represent a real force, and one which must be reckoned with. At present, however, the common denominator of these millions of British subjects is Islam, and the key and control of Islam lies in Constantinople, not in London or Delhi.

England as the greatest of Mahomedan powers should endeavour to safeguard the integrity of the Ottoman Empire. At the present moment the British Government is chiefly occupied with Cabinet differences and local affairs and seems to have completely forgotten that it is a Mohammedan Empire as well and that it behoves it to stand well with the centre and direct control of Islam. The writer says:—

If England is hall-marked throughout the world of Islam as friend and defender of the Caliph, many of the sources of possible danger will have become innocuous, even if they have not been turned into forces for good. To allow any other country, especially Germany, to usurp in the world of Islam the place which is ours by right, would not only be reprehensible, it might easily be almost suicidal. Nor must it be forgotten that besides the very real advantages which are to be gained by friendly alliance with the head of Islam, there are sufficiently good reasons for friendship with the Sultan of Turkey as temporal monarch. And "entente" with Turkey means much in the Mediterranean question; more still for the Suez Canal, while it opens up a safe land route to India.

Prompt and decided action on the part of England is therefore a necessity. It will checkmate possible schemes of dismemberment of other powers. It will encourage Turkey to proceed with the reforms and develop her resources.

The Influence of Indian Universities

The place of honour in the current number of *East and West* is given to an article on the above subject by Rai Bahadur Lala Baij Nath. It was originally intended to be read at the Imperial Universities Conference recently held in London but it was received too late to be included in the proceedings. In this paper the writer examines critically the state of education in this country and the results of its working among the younger generation. What has the University done?

The university man leads in whatever sphere of life he may be placed—in the learned professions, in the councils of the Empire, in the public services, in Native States, in the public press, and in schools and colleges. The graduate or the undergraduate of the university has taken the place of the man who has not received a modern education. Even in the sphere of religion one or two have made their influence felt not only in India but also in Europe and America, and men like Swami Vivekananda and Ram Tirtha commanded as many disciples in the West as in the East. In the matter of social reform also, men like Mahadeo Govind Ranade have left their mark upon the history of their people. The impetus given to the Indian mind in all directions of reform and progress has thus been very great, and the culture which used formerly to be one-sided is now many-sided. The diffusion of knowledge in the country through the liberal policy of the British Government is one of the greatest blessings of English rule in India, and entitles it to the everlasting gratitude of the Indian people.

But the question remains whether the kind of education that has been imparted to the youths by the Universities has produced any good influence on the morality and the religious ideals of the people. Everywhere there is growing a sense of dissatisfaction with the present system of university education. The rulers fear that it has been the cause of all the unrest and dissatisfaction with the British Government and the people attribute to it that unsettling of beliefs, that want of lofty spiritual ideals and that bewetting sin of the want of the spirit of renunciation so characteristic of the ancients. Everywhere there is a cry for religious and moral instruction. Some time ago the writer sent the following questions to some of the most thoughtful men in the country.

I. Is any, (and if so, what,) religious education imparted to your boys (a) at home and (b) at school? Do you advocate the imparting of such education in schools? If so, on what lines? How can religious education be best imparted at home? Does the system of congregational prayer meet the necessities of the Indian youths in respect of such education?

II. The educated Indians are said to be indifferent to religion, without high ideals or noble aims in life, more given to treading beaten paths than striking out new and useful careers for themselves. If they show any activity at all, they are more anxious to discuss political subjects upon crude or imperfect information than practical topics, more given to talking than doing anything practical for the social or economic amelioration of their countrymen. Are these complaints true of your educated people? If so, to what extent, and what remedy would you suggest?

III. What are the general conditions of life most observable in your parts among the educated classes in respect of food, dress, habits of thought, religious ideas and public morality?

The answers to these questions have been invariably the same. Almost all the letters received in reply urged the necessity of religious education and attributed all the present troubles to the system of Godless culture now in vogue. Every one of the learned authorities on the subject pointed to the traditional and inborn spiritual instinct of the race and demanded that the new culture must be in accordance with the old ideals. Well, what has been the result of the so called special colleges with a bias for religious instruction?

In the Central Hindu College, Benares, where secular education is professedly imparted along with religious instruction, the result of 12 or 13 years' work has not been the infusion of any deep spirit of religion in the minds of the majority of its students. This is equally true of the Anglo-Vedic College of the Arya Samaj in Lahore. In Aligarh the idea in the beginning was to have a college for national Mohammedan education along national lines, but it had ultimately to be modified and the college became like other colleges an Arts College, teaching for university degrees. In the Punjab, when the Punjab University was started, the idea was to promote Oriental learning, but there also the scheme had to be modified in favour of ordinary university degrees, as it did not attract men of culture who would prosecute Oriental studies for learning's sake, and the ordinary class of Pandits and Maulvis who went there, did so for earning a livelihood. In the Sanskrit College, Benares also the students do not go for receiving religious instruction for the sake of such instruction, but because they expect by it to have a start in life.

The writer concludes with an appeal for proper consideration and co-operation on the part of the leaders concerned with the respective universities.

Emperor Visaldeva.

The *Vedic Magazine* for the current month publishes an article by Mr. Harbilas Sarda, B.A., F.R.S.L. in which he sketches the life and achievements of Emperor Visaldeva who came to the throne of Ajmer about 1152 A.D., after expelling his elder brother, the parricide Jugdeva. They were the grandsons of the celebrated King of Gujrat, Sidhraj Jai Singh.

Visaldeva's reign is a landmark not only in the history of the Chohans, but in the history of India. He was the first Chohan Emperor of India. He reduced to submission the various rulers of Hindustan. The principalities of Pali, Jalor and Nadole (the last, once an independent Chohan kingdom) had during the time of Aroraja acknowledged the suzerainty of the Gujrat king Kumarpal and transferred their allegiance to him. Visaldeva therefore attacked them. He "burnt Jalor, reduced Pali to a hamlet and Nadole to a marsh." All these were once Chohan fiefs of Ajmer, and Visaldeva once more reduced them to their original status, and compelled them to look to Ajmer rather than to Anhilwara Patan for protection and safety.

He also conquered Delhi from the Tanwars and made the king of Delhi a feudatory of Ajmer. He then advanced further north and east and drove the Musalmans out of Hindustan and became Emperor of India.

This proud boast of Visaldeva that he had exterminated the barbarians and made Aryavarta once more what its name implies, marks the zenith of glory to which the Chohans reached; and his earnest appeal to his successors to drive them beyond the extreme borders of India, though unheeded by the first three of his successors, found an echo in the thrilling heart of his nephew, the chivalrous Prithviraja, whose glorious exploits shed lasting lustre not only on Chohan arms but on the whole Hindu race.

He was also a beneficent ruler. He founded a number of towns, constructed trunk roads, irrigation canals and beautiful lakes fitted with steps leading to the bottom. His personal accomplishments were in every way worthy of him:—

Visaldeva was a great poet. Fragments of his drama *Horakeli Natak*, prove his scholarship. "Actual and undoubted proof is here afforded," says Dr. Keilhorn, "to us of the fact that powerful Hindu rulers of the past were eager to compete with Kalidasa and Bharavhuti for poetical fame."

But the Empire he founded did not last more than forty years. For then the very barbarians whose ancestors he had driven out returned and overwhelmed his successors.

Residential Universities.

Mrs. Annie Besant writes in the *Central Hindu College Magazine* that the Indian has only known Universities founded by the Government in this country, wholly alien from the old centres of learning such as those of Nadiad, and the like. She says.

These Government universities have not been real Universities at all, but mere Examining Boards. They have been the centre of geographical districts, in which arose "affiliated" Colleges and "recognised" Schools, and from these came their undergraduates. They are responsible for the efficiency of these, and have been struggling to exercise some effective supervision over them, but the supervision is not very successful, as is testified by the extraordinarily low percentage of passes at their examinations. They can only maintain the standard of their degrees by a merciless annual slaughter of the ill-prepared candidates sent up. They cannot become centres of learning, still less of culture for they have nothing to do with the surging crowds of students save to examine them. The new Universities have asked for powers of affiliation to extend over the whole India, not over only a fifth part thereof and are to exercise supervision—of what sort?—over Colleges situated from the Himalaya to Tuticorin, from the shores of the Bay of Bengal to those of the Indian Ocean. Unless this be given them, say some of our Moslem brethren, it is not worth while to have a University of our own at all. The Englishman has only known in his own land Universities which educate, not only examine, and the experiment of the modern Examining Board called the London University has been looked on with much disfavour and it is being changed. Its graduates did not bear the stamp of "University men," and were not regarded as such by the products of the real Universities; they were learned and able, but were not necessarily cultured gentlemen. Their social value as London graduates, was nil. The "Oxford man," the "Cambridge man," he was known all the world over, and if not always learned he was polished and chubbable—"a social asset. Hence, to the Englishman the hybrid Examining University has always been an object of derision and good humoured contempt. Probably Englishmen in India hardly realise that the only ideal of a University known to Indians is of this type, and that the Indian is naturally disappointed when the ancient ideal of a University is offered to him in exchange for that which he had expected, while the Englishman may feel annoyed if what he thought to be a gift of gold instead of one of tinsel is received with murmurs of displeasure.

What to do? She says frankly that the residential teaching University is the only one which is really worth having, and the Indian, with his acute and understanding mind, will realise this as soon as he escapes from the obsession of these Government Examining Boards, the poor—though for the time the only possible—substitutes for real University education.

An Indian Poet in England.

Mr S. K. Ratcliffe gives an interesting sketch of the life and achievements of Mr Rabindranath Tagore in a recent issue of *The Manchester Guardian*.

It has never happened before (and the fact is noteworthy) that the literary society of England has been able to become acquainted in the flesh with a great Eastern writer whose fame rests entirely upon the work he has done in his own mother tongue. Such, however, is Mr Rabindranath Tagore, the representative poet and man of letters of Bengal, who went to England some weeks ago, and some of whose poems, handed about in manuscript, have made an undeniable impression upon those of his English contemporaries who have read the translations. A portrait of the poet by Mr. Henry Lamb was reproduced in the *Manchester Guardian* a few days ago, and it is probable that before the end of the year a volume of selections, translated into English prose by Mr. Tagore himself, and edited by Mr. W. B. Yeats, may introduce him to a wider public in the West.

The position of Rabindranath Tagore in modern Bengal is without a parallel. He is a man in the prime of middle life, and for a quarter of a century his influence and renown have been growing. It is impossible, of course, for one unacquainted with the Bengali tongue (in which alone the poet writes, despite the tradition of his family in English scholarship and his own familiarity with our language and literature) to speak of his work save by hearsay. One can only record the judgment of his countrymen. That, however, is altogether unequivocal: his name is a household word in the Bengali speaking world. His songs are heard everywhere from the North-west to Burma. His poems and dramas, stories and essays, printed in the Indian magazines or circulated in cheap editions, count their readers by tens of thousands. He is the acknowledged master of Bengali literature, honoured as artist, thinker, and teacher, as a builder of harmonies, a maker of new forms, as the writer who more than any other has revealed the capacities of the Bengali language for imaginative and philosophical expression.

This personal achievement would of itself be sufficiently remarkable, but it so happens that Mr. Rabindranath continues and fulfils a great family tradition by virtue of which the Tagores constitute the flower of the intellectual aristocracy of Bengal.

The Art of Biography

There is an interesting article on the subject in the last number of *The Fergusson College Magazine* by Mr R. D. Ranade, B.A. Having discussed the necessity for this kind of composition he draws a distinction between history and biography.

Similarly he distinguishes between biography and characters in fiction or drama. And then follows a list of the masters of biography, those who have excelled in this form of literary art. He gives the palm to Xenophon and Plutarch in the ancient world, and Boswell, Southey, Lockhart, Froide and Morley in the modern world.

Among the requisites of a biographer are personal knowledge, self abnegation, assiduity, love of truth, and a spirit of admiration. He illustrates each one of these items with sufficient reason and force. These, he says, are the intellectual and moral outfits of an ideal biographer. But then there are some equally important factors in the construction of a biography. In the matter of the collection of materials, critical form, minuteness of detail, experimental method of determining character, life like presentation, weaving chronology with criticism, great tact has to be displayed.

The writer then makes a few observations on Autobiographies. Among the celebrated pieces of autobiography, are the *Confessions* of St Augustine and Rousseau and De Quincey's *Opium Eater* and also the more formal works of Mill, Herbert Spencer, Benjamin Franklin, Max Muller and Annie Besant.

The writer insists that the biographer must be imbued with a moral purpose.

It is such a man alone, who can take the opportunity of giving an impetus to man's evolution by celebrating the moral qualities of his hero. He can remind men that they can make their own lives sublime; he can make them understand the motive power of Biography in guiding and influencing their conduct. He alone can bring to light the romance that lies enfolded in human life; and he can show how the inventive life of Edison, the imaginative life of Shakespeare, and the philosophic active life of Sankaracharya far transcend the limits and dreams of fiction.

Christianity in India.

The *Hindustan Review* for September publishes an article on the above subject by the late Rao Babadur V. J. Kirtikar. He says:

Having regard to the undoubted fact of Ecclesiasticism rapidly waning in Christendom and to the trend of the religious thought in Europe, which is daily approaching more and more the ancient philosophical and religious thought of India, one would naturally expect that the ardour which had animated the missionaries of fifty years ago in India would be reduced to its lowest ebb in this twentieth century. But we find that it is not the case. Our Christian missionaries are still as busy as ever. Some of them are engaged in establishing that Christ and not Krishna shall be the Saviour of India; others are actively engaged in vilifying to their heart's content the Hindu Ideals; others, again, are deliberating upon how best to carry on the work of conversion to Christianity.

Since lately we have been witnessing the phenomenon of church dignitaries also taking an active interest in missionary undertakings. Curiously enough, this activity was seen aroused almost simultaneously throughout India, for the first time, about five years ago. The Bishops of Calcutta, Madras, Bombay, Allahabad—all came forward with their views and suggestions on the question of the Evangelisation of India.

The subject of Biblical instruction in Government educational institutions attracted so much public attention at the time that other Christian theologians and laymen came forward to urge the claims of Christianity on the attention of Lord Curzon, the then Viceroy. We do not know for certain whether this was one of the subjects discussed at the Education Conference, which met shortly afterwards and held its sittings *in camera*.

We are, however, told that Lord Curzon's own view on this question was that, if religious instruction was to be part of State education, it ought to consist of religious instruction to each section of the Indian community in its own sacred literature.

That is a view which is as eminently statesmanlike as it is perfectly just and equitable in the interests of the entire Indian population, which Providence has placed under British protection.

The writer then shows some pitfalls of Christianity and says that it will be useless to teach the doctrines of Jesus to the Hindus. But there is danger in the interference of Government in matters of religion.

The policy of religious neutrality had been, ever since the advent of the British rule in India, recognised as the wisest that could be adopted. It was strongly advocated by men like Elphinstone, Munro and Malcolm—men who were deservedly entitled to be ranked among the makers of the British Empire in India.

There is no fear that the British Government will ever abandon its highly liberal policy of religious neutrality, for which it has justly become famous.

Up to-date Child Education.

For a long time, the application of scientific methods to problems of education has been considered by many educationists. Among such workers, writes Mr. S. G. S. Manian in the August *Educational Review*,

stands marked out an Italian teacher and physician, Maria Montessori, who has evolved a method for the education of small children as the result of her pedagogical research on scientific lines lasting over a period of fifteen years. She began to investigate into the methods adopted towards mentally deficient children under medical treatment and she was led to think that it was necessary to allow the child to develop in its own way along its own lines and to that end a pedagogical treatment was to be preferred to a medical treatment. Her views came to be gradually recognised by the leading educationists in Italy. She established an all-day school in Rome for children who were mentally deficient. While she was thus treating the children pedagogically, there grew upon her the conviction that her methods of training feeble-minded children might as well be used for children of normal mental power. In time she was given permission to carry out her ideas in a practical way in the schools of Rome.

'Liberty' of Rousseau and 'Self-activity' of Froebel are the recognised methods of developing the mind of the young. She says that "The liberty of the child has as its limit the collective interest; as its form, what we universally consider good breeding. We must therefore check in the child whatever offends or annoys others or whatever tends towards rough and ill-bred acts. But all the rest—every manifestation having a useful scope—whatever it be, and under whatever form it expresses itself, must not only be permitted, but must be observed by the teacher."

The salient feature in her method is that she considers the teacher as merely a passive agent rather than an active one. The active agent throughout is the child. Her idea of a well-disciplined class is "a room in which all the children move about usefully, intelligently and voluntarily without committing any rough or rude act."

Her system of education has been nationally adopted in Italy and Switzerland.

Tibet, China and India

Mr. Percival Landon contributes an interesting article on Tibet, China and India to the October number of the *Fortnightly Review*. In the course of the article he says that by the announcement of the Indo-Tibet treaty

England had utterly broken the military strength of Tibet, had driven into distant and apparently permanent exile the sacred head of Lamaism, had denied Tibet even the presence of an Indian official within her gates, and, to crown all, had imposed a nicely calculated fine of exactly the amount that Tibet could not easily pay at once, and that China could pay—and, of course, at once insisted, as suzerain, upon paying. It was an extra yoke upon the neck of the unhappy Tibetans, who already needed nothing more to humiliate them before their ancient enemies.

Six months afterwards the disillusionment had come, the white men had retired as mysteriously as they had come, and the Chinese were beginning a steady movement for the recapture of Tibet—not this time as a tributary State, but as a province of the Empire.

In the sudden and unhelped for chance of retaking Tibet that the policy of the India Office presented to China, Yuan shi kai saw the opportunity for rounding up the whole of the territory that surrounds the north eastern corner of India into a homogeneous whole. He therefore made his plans for operating at the same moment against Lhasa itself—where no resistance was then to be feared, but where a demonstration of strength was of the first importance—and against the tribes of this No-Man's Land. His success was immediate. The monasteries round the former place, after meeting with one disaster, abandoned their attempt to recreate even the traditional golden army.

But the British Government have kept quiet, they have surrendered Rima to China as Tibetan territory. Mr. Landon criticises this policy vehemently:

Now it is difficult to defend this policy either as a matter of wisdom or of fact. from the point of view of the former, the territory of Tibet should have been protected then, just as we have to protect it, and are protecting it, now, looked at as a matter of fact, it was an unnecessary and dangerous thing to admit that any town or district that paid tribute to Lhasa was therefore Tibetan. It was as unreasonable as it would be to assert that the payment of Piers's Pence makes of Ireland a Papal State. It was more than unreasonable, it was dangerous. No one with any sense would make the suggested assertion about Ireland, but a natural and serious extension of the line of argument thus volunteered by the British Government was at once made by China herself.

The administrative discretion of a Governor-General stops at the frontier pillars. He cannot send a force beyond them without the sanction of Parliament. But obviously where there are no pillars this check upon his discretion is practically non-existent, a fact which is naturally of great advantage for the rapid and masterful handling of a sudden difficulty. Within seven months, however, Lord Hardinge had seen cause to change his views, and the Abor expedition was prepared and eventually despatched in the autumn of 1911.

Thus it has been said was ostensibly a mission sent to punish one or two villages for the murder of a British official. In reality it was part of a much greater scheme, it covered an intention to get some accurate knowledge of this totally unknown frontier of Burma and Tibet, which rapidly threatened to become the scene of some difficulty with the Chinese. It must now be explained that from the South-eastern corner of Bhutan—and even that is a highly debatable point de départ—to half way down the Eastern border of Burma, no frontier of India has ever been delimited in this region. The distance thus left open is between six and seven hundred miles. The only exception to this statement is the single point on the river at—or really several miles below—Rima to which reference has been made. This line of demarcation must run somehow in a huge curve to the East-north east and then to the East-south east, South-east, and south, but that is all that anyone knows.

It will be remembered that Lord Curzon created a North-West Frontier Province under the direct supervision of the Government. It was, as not a few of his works were, a statesmanlike and even necessary change which he had the courage to translate into being after other Viceroy's had looked the facts firmly in the face—and passed by on the other side. He was not so much abused for what was done as for the way he had done it.

So there was much to do—and now everything is quiet, Lord Hardinge may at least congratulate himself upon turning Assam into a North East Frontier Province in such a way that of those who heard or read the Imperial Proclamation last December not one in a million realised that the thing was being done. Under cover of the dust that was being raised by changes of vast romantic and controversial interest the direct supervision of the area that seemed likely to give trouble in the near future was almost surreptitiously transferred to the Central Government; and Lord Hardinge deserves full credit for having made this astute provision for the future.

QUESTIONS OF IMPORTANCE.

Babu Govinda Das on "The Public Service Commission."

We have pleasure in reprinting from a contemporary the interesting Memorandum prepared by Babu Govinda Das on the much debated question of the Royal Commission :—

Not many months hence the Public Service Commission will commence its enquiries in India. There will be divergence of opinion with regard to the endless details that will form part of the enquiry by the Royal Commission but it may be possible to settle some general principles on which more or less universal agreement may be arrived at. In the following lines, I will deal with the subject under two heads—(1) consisting of a few suggestions indicating the principles which should govern recruitment and appointments to different branches of the public service; (2) consisting of illustrative remarks showing how those general principles may be worked out and applied in special cases.

It is hoped that these suggestions of mine will lead to a series of suggestions from others threshing out the whole vast field of enquiry, with more or less of authoritative opinions, according to the standing of the writers. It is to be hoped that our Moslem fellow subjects will recognise the absolute necessity of making common cause, as far as possible, with the Hindus, and will not be swayed by any narrow communal feeling or the fancied needs of a blatant political loyalty, into indifference or opposition, considering that the question is one which affects both the communities. The domiciled community should also remember that real patriotism is always territorial and that the interests of the country in which they have to live are more paramount than considerations of so-called blood or religious ties. Let all of us keep in the fore-front the one solid fact that India is our common home.

A word of warning is necessary. No one should undertake to give evidence before the Commission in a light-hearted spirit. The cross-examination will be very severe, and rightly so. There is no room for weak kneed philanthropy in the stern task of governing a huge empire. The evidence to be submitted has to be carefully prepared and will require hard labour if it is to be worth anything. So let us begin to prepare betimes and start at once collecting, sifting and classifying all the available materials.

The best witnesses would be the retired members of the subordinate services. They would have all the details of the disabilities and inequalities from which they suffer, at their finger's ends. Will they have the courage to come forward and throw full light on the conditions of their service so that the lot of their successors may be improved? The brief notes on the subject offered below are merely tentative and are meant more in the nature of provocatives, to excite thought and discussion, than as cut and dried conclusions to be unresistingly swallowed like dogmatic theology.

SUGGESTION OF POINTS.

1. No colonial shall ever be employed to any post in British India, so long as equal treatment is not accorded to Indians, so long as differential treatment is meted out to the Indian in even a single colony.

Both justice and the self-respect of Indians demand that this broad proposition should be accepted and enforced, in order to bring home to the different colonial Governments who treat British Indian subjects as pariahs, that they cannot reap the full benefits of forming a part of the British Empire, until they shed their racial pride and arrogance and offer the rights of free citizenship to the Indian subjects of his Majesty.

2. Subject to the above, all distinctions based on race or religion should be abolished.

3. The plea often put forward that because a certain community is less advanced educationally, hence preferential treatment should be accorded to its members as a matter of right or favour is radically unsound and politically injurious. It is not by depreciating the calibre of the services in the interests of this or that community, that the best interests of the country or even of the community or communities so favoured, are served. The best and only justifiable way would be by providing special educational facilities for such backward communities if there be any such. Merit and capacity alone should form the criterion for appointment to the public service. As a matter of fact the real backward communities in India are the huge *untouchable* communities and those next above them the depressed classes—not the lowest but the low castes.

4. Every one of the multifarious services to be thrown open to open and free competition. The present demoralising conditions, where the appointment is either wholly (1) by nomination, (2) or by competition after nomination, or where it is reserved for Europeans only, is abso-

lutely fatal to true efficiency and to self-respect among the seekers of such appointments.

5. All those *departmental* rules which prevent Indians *as such* from reaching the topmost limits of the services or of even entering into them, to be abrogated.

6. Excepting the Indian Civil Service, every other service to be recruited in India alone. Britishers wishing to compete for them to be required to do so on Indian soil. The I. C. S. to be recruited both in England and in India by simultaneous examinations.

7. In all those departments where a high state of efficiency depends upon an up to date knowledge of the discoveries and inventions made in Europe and America—such as the Educational, Medical, Engineering etc, every employee who is a candidate for the higher grades of that service to be required to put in a special course of 3 years training in some European or American centre before he becomes eligible for such promotion. Special rules to be framed for such cases, which would divide the burden of the expenses between the Government and the candidate, say, half and half. Further, the employees to be allowed one year's leave on full pay every 7 years, to allow of their keeping abreast of knowledge concerning their special departments by spending the year in European universities or centres and to be required to submit a report and a diary on their return.

8. The wholly unjust and exceedingly undesirable system of D. O.'s which punishes a subordinate in the dark and allows free and full play to the whims and prejudices of the superior officers to be totally done away with. No officer of whatever grade to be ever punished, by suspension or degradation on the mere strength of *secret* reports against him. In every case, he should be allowed a full chance to meet the charges and appeal to the highest authority.

9. The cadre of the higher grades is as a rule very small. It should bear a more reasonable proportion to the cadre of the lower grades than it does at present.

10. A great deal of invidious distinction is made in the matter of (1) leave, (2) pension, and (3) acting and travelling allowance rules between the services which are manned by Europeans and those which are manned by Indians—these should all be equalised.

11. Separation of the judicial and executive functions.

SPECIAL DEPARTMENTS

1. The statutory limitation restricting the choice of executive councillors of the Governor-

General overwhelmingly to the I. C. S. to be abrogated, and a greater and wider range of choice to be permitted, to meet adequately the no longer narrow conditions of the earlier days.

2. The duties of the District Officer should be strictly administrative and executive. His functions should be the collection of revenue and the control and supervision of the police. The post of the District Superintendent of Police should be abolished and his duties vested in the District Officer. The District Officer to be styled Commissioner. He should have two deputy commissioners under him, one to be in special charge of revenue and the other in special charge of police. Of course here is to be a regular gradation of superior and inferior officers, according to the requirements of the work. There will be assistant deputy commissioners of police and of revenue under this arrangement, and the functions of the two will have to be kept separate. The assistant deputy commissioners of police will occupy the place of deputy superintendents of police. Under the proposed arrangement, all the revenue cases will have to be decided by civil courts, as in Bengal. The evils of judicial and executive functions being combined in the same individual will disappear.

The practical denial of justice and untold hardship inflicted upon poor villagers by the present system of having peripatetic magistrate collectors, under which cases are tried 20 or 30 miles from their place of inception and the parties have to tour along with the officer, will come to an end. Justice will be administered in revenue and rent law by more competent judicial courts. The district officer being relieved of judicial duties, will have more time to come in much more frequent personal contact with the people of his district and to know them more intimately. The efficiency of the administration will thereby be considerably improved. He should also as far as possible be relieved of his duties in connection with local boards, which should be made more autonomous.

3. All judicial officers not only to be merely subordinate to the High Court, but their appointment, leave, promotion, dismissal, etc., should also rest with the High Court.

4. A separate expert jail service should be organised and only officers especially trained in criminology and acquainted with the modern systems of jail discipline and treatment as it has been evolved in Western countries, should be appointed. The present practice of having I. M. S. men for the superintendents of jail ought to be discontinued.

5. A separate expert treasury service to be organised beginning with the treasury officer and

going right up to the accountant general and comptroller-general.

6. A separate Women's Medical service, exactly on the lines of an amalgamated Men's Medical Service, to be organised. The recent suggestions put forward by a deputation to Lord Crewe about having an Imperial and a Provincial Service, the former to be recruited on a very much higher salary and only in Europe is a thoroughly vicious proposal and should on no account be encouraged.

7. The I. M. S. men and the assistant surgeons all to be graded together. It is ridiculous that the I. M. S. which is mainly meant for the Native Army, should be practically restricted to Europeans, who besides being given appointments in the military, are given comfortable civil berths. The assistant surgeons have to pass through a very severe course of training and as regards medical knowledge, are in no way inferior to the I. M. S. men. Justice and impartiality require that qualified Indians should be promoted and appointed to the posts of civil surgeons, which are a practical monopoly of the I. M. S. men. With a larger number of qualified lady physicians, the objection to having Indians as civil surgeons will disappear, so far as the treatment of European ladies in ailments peculiar to women, is concerned.

8. The grade promotion examinations which the assistant surgeons have to pass through should be abolished. Why should the assistant surgeons be required to undergo such examination and the I. M. S. men be exempted from any test whatsoever before promotion? Why should it be presumed that assistant surgeons forget their medical sciences and the I. M. S. men always keep their knowledge fresh? Why this invidious distinction? I would think that it is not the assistant surgeons who should be periodically examined before promotion, but the heads of the medical department in various districts on whom the whole efficiency of the department depends, should be required to satisfy a test before promotion. Fat salaries should not be easily obtained. There is a manifest injustice and an invidious distinction in prescribing a test before promotion in the case of assistant surgeons, who are as a rule Indians, where the increase of salary is so small, and not prescribing it in the case of civil surgeons, who are Europeans, where the increase in salary is considerable.

9. The status and pay of the sub-assistant surgeons should be raised. They should also have the diploma of L. M. S. conferred on them. There is not another class of hard worked public servants

who are treated with less consideration than sub-assistant surgeons.

10. Similarly the P. W. D. overseers, who have to undergo a three to four years course of still training, should have their pay and status raised and given the diploma of L.O.E. on passing.

11. The highest grade of Munsiffs should draw Rs 500 and of Sub Judges Rs 1,000. Half the cadre of the Sub judges should be recruited from the bar. Ten years' practice at the bar may be prescribed as being necessary for such appointments. The Munsiffs should only be appointed by a competitive examination. The present mode of recruitment of munsiffs is very defective and results in the appointment of men of generally very mediocre abilities. The initial starting pay of munsiffs will have to be raised to draw a better class of men. District Judges should not get more than Rs 1,500 as salary per month. Half the cadre of District Judges to be filled by promotions of Subordinate Judges, and the other half from the bar. There should be constituted divisional benches of two judges, one of these to be recruited directly from the bar and the other by promotion from among the District Judges, with monthly salaries of Rs 2,500, to hear appeals from the subordinate courts of a prescribed valuation and nature. High Court Judges to be recruited as follows—one-third by promotion and two thirds by direct appointment.

12. No revenue officers such as tahsildars, mamuldars, deputy collectors, etc., should have judicial powers.

13. All districts and provinces that have been under British occupation for not less than 25 years to be made regulation ones, and the anomaly of appointing military officers to civil charges, and worse still as judges, to be totally done away with.

14. The military element in the political department to be wholly eliminated, *viz* Lord Rayer's views as given by Hunter (pp. 75-76, 'Bombay 1185-1890') A separate political service recruited from among the I.O.S. men of over 10 years' standing and in which the Indian element too would be fairly represented, to be created.

15. A large number of attachés to be thrown open to the scions of the ruling houses, after they have finished their college career, to train them up in civil administration, by thus directly bringing them into touch with the various and varying methods of the different native states.

16. The large amount of judicial work that political agents have to do and which even the heads of provinces have to do both in civil and

criminal cases (*vide* Hunter's Bombay, p. 83) should go before the Indian judicial tribunals.

17. Madras does very well without the fifth wheel of divisional commissioners between the Governor and the district officer and a good many provinces without the cumbrous machinery of the Board of Revenue. Both these to be abolished all over India, and if necessary, the Provincial Executive Councils to be strengthened by having their number raised from 3 to 6.

18. The Governor-General not to be in charge of any special department. This in practice often means secretariat rule. The Governor General should be left free to supervise *every* one of the departments. A Foreign Minister chosen from the British Diplomatic Service, of say, ambassadorial rank, is a long delayed reform.

19. A knowledge of more than one vernacular—and a pretty sound one too—is absolutely necessary not only for Europeans serving in the country, but also for Indians, and here comes in the perplexing question of scripts. There are over a score of recognised and accepted scripts in which records have to be kept and petitions accepted. It is preposterous to expect the hard-worked officer to master even one of them so well as to be able to read ill written Mas, not to say of 2 or 3 or more. A speaking knowledge is easily acquired, but the written word is mostly the frightening ogre. The simplest way out of the impasse is to order the use of *Roman* characters, throughout British India and discontinue the use of every other for Government purposes.

20. The district officer relieved of his judicial duties and under the designation of commissioner to become the head of the district executive council composed of (1) himself as the president and chief executive officer, (2) the inspector of schools, (3) district engineer, (4) district civil surgeon or district sanitary officer and (5) the municipal chairman, with a district council composed of 11 non official and 7 official members. This of course means the abolition of the present day district boards, which are unwieldy bodies for the work expected of them and powerless bodies for the work that is expected of district councils. The work they are supposed to perform would be done much more effectually by village unions and taluk or taluka boards.

21. All the High Court appointments, leave, pensions, travelling allowances, etc., should be brought under the Government of India in the Law Department. The Home Department should have nothing to do with these, nor the Provincial Governments.

22. The Ecclesiastical Department should be abolished.

23. On all guaranteed railways a certain number of the higher posts in every department, which are at present the monopoly of the European and the Eurasian, to be reserved for *bona fide* Indians and a clause to that effect to be entered in the contract and if the company refuses, then no Government guarantee to be extended to that railway project.

24. The Governors of provinces which have got an Executive Council should be selected from the ranks of English public life. Indian opinion is united on this point and there is no lack of support on this point from Anglo Indian opinion. The *Madras Mail* in its leading article of January 29, 1912, makes the following sensible observations on the subject—

'A Governor who has spent the best years of his life in India cannot be expected to defer to his colleagues as experts in matters in which he is to rank as an intelligent amateur. On the other hand, he cannot claim over them that superiority which a Governor appointed from Home possesses. Thus the position of a Civilian Governor with an Executive Council is an impossible one. Either his tenure of office will be remarkable for dissensions within the Government, or it will be remarkable for an autocracy not contemplated when the system of Governorships in-Council was established."

25. The second volume of the Civil Account Code, which is at present secret, should be published. Sumptuary allowances should be curtailed, and their amount should be expressly shown both in the provincial as well as the Government of India budgets. The publication of volume II of the Civil Account Code is absolutely necessary, as all matters connected with accounts should be subjected to the check of public opinion. Secret expenses and payments are apt to run very high, when uncontrolled by considerations which exist in cases where sufficient publicity is given.

DADABHAI NAOROJIS SPEECHES AND WRITINGS.—An up-to-date, exhaustive and comprehensive collection of his speeches and writings with a portrait. Price Rs. 2. To Subscribers of the "Indian Review," Rs. 1 8.

UTTERANCES OF THE DAY.

University Education in India.

At the third Session of the Empire Universities Congress held on the 3rd July last with the Rt. Hon. Mr. Balfour in the chair a paper was read by the Hon. Dr. Dava Prasad Sarvadthikari. In the course of his excellent address he refuted the common notion that Western ideals are disastrous to Eastern minds and disparaged the habit of comparison between China and India. He dilated at length on the extent and intensity of India's relations with England, on the intellectual kinship of the two countries, on the identity of their interests and on the necessity of a common ideal, and concluded his powerful address with the following brilliant periods:—

To the Hindu mind knowledge has never been the means only of improvement. It is the means of salvation itself. Knowledge of self in its relation to God and the universe is believed to be the only means of restraining aggressive selfishness. The West has long realised that such aggressiveness in spite of transitory glamour is the root cause of interminable conflict between nation and nation, between capital and labour, between man and man, between man and woman, which threaten to disturb, if not altogether destroy, the peace of the world in the name of material advancement. While Western science is helping in this advance, with the aid of which we are beginning to shake off our 'weak impracticalness,' the East has a mission and a message. It is a difficult and delicate task to harmonise that advancement with true spiritual advancement in which there shall be as little of the impractical old-world dreaming and as much as possible of the true inwardness of spirituality, which two thousand years ago, with the advent of the Prince of Peace, the East presented to the West, much to the abiding benefit of both.

In this great work the new universities of the East, based on the models of the West though overtly divorced from active and direct religious teachings will have a large and important place. Their influence on popular ideals will be proportionately large, ideals of self-abnegation and self-effacement that have been and ever will be the wonders of an admiring world. Quite an unique and eventful experiment is in progress. It has lasted but all too short a time. We celebrated

our first jubilee only the other day when some of you were celebrating your fiftieth. The time is hardly ripe yet for definite and matured results but we have no reason yet to despair.

The problem is an Empire problem and not merely academic. The augmenting importance of the East has nearly made it a world problem. Meet were it therefore that a special and early session of this great Congress of the finest intellects in the Empire should be devoted to it.

With statesmanlike instincts did our beloved King-Emperor and Queen-Empress realize and voice this fast asserting influence of the problem, while in India. And those in charge of their Majesties' reception responded. Wherever they went school children in their thousands acclaimed their Sovereigns. In Calcutta the number was twenty-five thousand, of all color, creed and race. These citizens of the morrow took to their homes tales of their Majesties' wonderful yet unostentatious personality, the influence of which would never fade, but will be replete with abiding and abounding good to themselves and the Empire. One of these was aged no more than eight and I heard her declare that she was lonely and desolate because their Majesties had left the Prince's Ghat that day.

When my university had the unique honor of being permitted to present an address of welcome to his Majesty, his Majesty declared:—'It is to the universities of India that I look to assist in that gradual union and fusion of the culture and aspiration of Europeans and Indians, on which the future well-being of India so greatly depends. You have to conserve the ancient learning and simultaneously to push forward Western science. You have also to build up the character without which learning is of little value.' You say that you recognise your great responsibilities. I bid you Go!—speed in the work that is before you—let your ideals be high and your efforts to pursue them unceasing and under Providence you will succeed.'

My university has resolved to inscribe these memorable words in gold on marble for the benefit of generations of graduates and undergraduates. It was a glorious and mighty Durbar I attended at Delhi. A mightier and a more glorious and eventful Durbar is assembled to-day under Imperial auspices for consolidation of the Empire of letters, the truest reagent for the consolidation of the Empire.

INDIANS OUTSIDE INDIA

Lord Amphill on "Indians in South Africa."

In the House of Lords, on the 17th July last, Lord Amphill, in rising to ask the Under Secretary of State for the Colonies what was the present position in regard to the question of the treatment of British Indians in South Africa, and whether it was intended to present any further Papers to Parliament in the near future, said —

My Lords, I am not going to take up your Lordships' time with a speech, but I must say a few words of explanation with regard to the Question which stands in my name. I am obliged to put this Question because there was no opportunity in another place for those interested in this supremely important question of the treatment of British Indians in South Africa to elicit information from the Secretary of State. Your Lordships will remember that the Secretary of State took the members of the House of Commons for a tour round the Crown Colonies, which was so interesting and protracted that there was not opportunity to go further. Those of us who have for some years past been interested in this question are feeling very grave anxiety at the present time. Our anxiety is due to two causes—in the first place, that the settlement which was promised so long ago, promised so definitely and so hopefully by the late Secretary of State for the Colonies, has again been postponed, and, in the second place, that the management of that settlement is now in other hands. General Smuts, who was Minister for the Interior, was personally pledged to carry out a settlement which, as we believe, had been agreed upon as satisfactory, not only by the Indian community in South Africa, but also by His Majesty's Government and by the Government of India. But now, unfortunately, the Bill has been postponed, and the office of Minister of the Interior is in other hands—in the hands, I believe, of Mr. Fischer, who unfortunately we know to be, I will only put it this way, less amicably disposed towards the British Indian community than was General Smuts. We should like to know most particularly whether the fact that there is a new Minister of the Interior will make any difference as regards the settlement, and also, of course, why exactly it has been found necessary to postpone this settlement.

Your Lordships will remember that more than a year ago we were assured most confidently and hopefully by the noble Marquess, the Leader of the House, who was then Secretary of State, that the settlement was close at hand, that he was really confident it would be brought about. Perhaps I may remind your Lordships what that settlement was. The essence of the settlement was the repeal of the Transvaal Act No 2 of 1907, which was so hurtful to the feelings of our Indian fellow citizens in South Africa. That Act, which served no useful purpose and only acted as a humiliation and a soreness to the Indians in South Africa, was to be repealed, while the rights of minors were to be safeguarded and the principle of the restriction of Asiatic immigration—to which the Indians themselves assented and which they recognised as inevitable and reasonable even—was to be that there should be no racial bar on the Statutes of the Colony. That was the one thing they had been contending for—that Indians should not be excluded on account of their colour. "If you must exclude us," they said, "let it be by administrative differentiation. Do it because it is a matter of economic convenience, but do not do it on the ostensible ground that you think we belong to an inferior race." We had hoped that the settlement might have been brought about long ago. It has been twice postponed. Therefore the first thing I want to know is what are the exact causes of the postponement, and then I should like to know whether His Majesty's Government are satisfied that the Bill which has recently been before the Union Parliament does actually fulfil those conditions of settlement to which I have referred. I know that there are competent lawyers in South Africa who say that it does not fulfil those simple and plain conditions, but that the racial bar is maintained in another form. What is the opinion of His Majesty's Government on that point? And supposing they are not satisfied, what steps have they taken, are they taking, or are they going to take to set that right?

Then it is also alleged—I speak subject to correction, but it is one of the points on which I am asking the noble Lord for information—that this Bill does deprive Indians in the Coast Provinces of rights which they have hitherto held undisputed. Is that the case or not? His Majesty's Government, in the Despatch of October, 1910, I think it was, said that no settlement of the Transvaal Indian trouble would be acceptable if it diminished the rights of Indians in other provinces. All along it was the professed aim of the South African Government, long before the

Union, that they did not wish to diminish the rights of Indians who were already lawfully resident in that country. Lord Selborne, when he was High Commissioner, made that the keynote of his statements on the subject. He said he did not wish in any way to treat Indians who were lawfully resident in the country one whit less well than they had been treated before. The only thing hestuck out for was that no more were to be admitted, with the reasonable exception, which has been agreed to now by all parties, that the few educated men who are required for the natural life of the community, as ministers of religion, as doctors, and as lawyers, should be admitted. The number of six per annum was given as a probably reasonable limit to the requirements of the community. I hope it is not the case that, after competent examination, it has been found that this new Bill does actually diminish the existing rights of Indians in the country, because, if that were so, it would be a very grave and unpardonable breach of faith. I trust, therefore, that we shall hear that His Majesty's Government have examined very carefully into the point and have been in friendly communications with the Union Government about it.

But there is one more word which I must say in order to explain the object of my Question, and that is, that the spirit of this settlement, which we were told was so near at hand, seems to have been violated during this period of delay. It was because we were allowed to expect that there would be an immediate settlement that the Indian community themselves agreed to drop their passive resistance movement. It was because we were told that a settlement was at hand that friends of the Indian community in this country stayed their hand and have since shown considerable reticence and self-restraint. We have waited most patiently, we have not bothered the Government with Questions and Motions in Parliament, we have treated them with very considerable trust and confidence and have waited patiently for a long time before asking them again what they were doing in regard to this question. I say that advantage has been taken of this delay to violate the spirit of the settlement. The spirit of the settlement was to treat Indians who were lawfully resident in the country as well as possible. I must show what I mean by quoting some instances. In the first place, the Transvaal Supreme Court have taken a very serious course in deciding against the introduction of plural wives married according to the law of Islam, and there has been a notorious case in which it has been decided that the second

wife of a Mahomedan cannot be admitted into the Transvaal. It is going further than that. It seems to me to be part of a very deliberate movement, for there is now an attempt to secure a decision against the admission of Mahomedan wives at all into the country on the ground that polygamous marriages are not recognised by the Transvaal law. From there it would only be a step to declare that the offspring of these marriages are illegitimate. I need not enlarge upon that point. I need only appeal to your Lordships' imagination. Your Lordships have only to think for a moment what the consequences would be in India, in Egypt, in every part of the Empire where there are thousands of His Majesty's loyal Mahomedan subjects, if an affront, an insult, of this kind were levelled at the Mahomedan religion. Surely the whole spirit of rule under the British flag wherever it was flown has been religious toleration. There seems to me absolutely no ground for departure from that principle, and surely whatever the risk may be, it is the duty of His Majesty's Government to uphold that principle wherever there are British citizens under the British flag. That is a very serious matter. Apart from everything else, a necessary question, if the movement is allowed to continue, is the breaking up of homes, the wives not being allowed to come in or being turned out of the country, the separation of families, the ruin of business, the expulsion of men whose right to be in the country has never been questioned, and consequences which I leave to the imagination of any one of your Lordships who will take the trouble to give the matter a thought. I want to know what His Majesty's Government have done in regard to this decision of the Supreme Court of the Transvaal. Have they pointed out how fatal would be the consequences of carrying this movement any further? Have they protested? What has been the nature of their protest, and what answer have they received?

There is another matter, and that is the growing tendency on the part of the immigration officers to exercise arbitrary power. On one case I had occasion to correspond with the Colonial Office, but I got very little satisfaction. That case showed this, that even if an Indian can prove his right to be in the country to the satisfaction of the Supreme Court, it is within the power of the immigration officer to keep him out. That was proved by the decision in that particular case. It is said—I want to know whether it is the case or not—that the present Bill increases the arbitrary powers of the immigration officers. General Smuts,

in introducing the Bill, did make some sort of apology for what he regarded as the occasional excesses on the part of the immigration officers. On a par with this action of the immigration officers is the exclusion of children of lawful residents in the country by the Portuguese officials at Mozambique at the instance of the Immigration Department of the Union. What has been the consequence of this? It is a very serious consequence, and I cannot understand for the life of me why more notice has not been taken of it. The result is that the Germans are imitating our example. In German East Africa they are proposing anti-Indian legislation on the ground that we are pursuing the same course. What will be our position as a nation before the people of India if we are obliged to confess that we cannot protest against this exclusion by a foreign country because it is merely what we are doing ourselves? There are other matters which are serious enough, though they are smaller. For instance, the growing tendency to exercise the trade licensing laws in Natal with the apparent object of making it impossible for Indians to have a right to be in Natal, whose right has never been questioned, with the object of compelling them to leave the country. The same is being done, during this period of delay of which I have spoken, with the Townships Act in the Transvaal and the Gold Law. The tendency of the regulations, which seem to be unlawful regulations, under that Act is to force Indians into locations. I should have thought that His Majesty's Government, of all people, would instantly object to and resent any attempt to force Indians into locations. That was the test of Chinese slavery. The one test was that Chinese labourers were obliged to live in locations. What, then, is the Government's answer to and their justification of this deliberate tendency to force Indians into locations?

I could give scores of instances of the way in which advantage has been taken of this Bill to oppress—there is no other word—the lawful Indian residents in the Transvaal. What I want to know is whether His Majesty's Government have been taking note of these oppressive acts, whether they have done anything to protect His Majesty's subjects, our Indian fellow subjects, who are in South Africa and have every right to be there, whose right has never been questioned. I emphasize that because it is not a case of immigrants who have forced their way in without permission. I do hope the noble Lord who is going to answer me will not give that answer which I

have often heard before, and which I dare say the occupants of the Front Bench opposite think good enough for me. It is not good enough for those on whose behalf I speak. It is not good enough for anybody who regards this question from the point of view of common sense and the interests of the Empire as apart from the ordinary devices of political Parties in Parliament. That answer is that you cannot interfere with a self-governing Colony. That seems to be satisfying to many people but it is a rotten answer, a stupid answer. In the first place, there is no question of interference. Let me remind you of the Maleeka case. If you can interfere with the Government of a foreign country, over which you cannot possibly exercise any compulsion in order to secure the reversal of the acts of a Court of Justice on behalf of one single person who was only half British citizen, if she was a British citizen at all, then surely you have a right to do something, to say something, to make a bargain, to come to an understanding, about thousands of persons who are wholly British citizens, and to make that understanding with people who are your own national kinsmen, who are under the British flag, who are under the authority of our Sovereign, and with whom—and that is the point—we have absolutely vital interests in common. If you cannot come to an agreement with our kinsmen in our dominions overseas about matters which concern the whole welfare of the Empire, then I say that the Empire itself cannot have any existence in fact.

I wish to Heaven that I had the power or the knowledge which would enable me to create public opinion and propitiate those wizards of the Press who, for good or for evil, influence our destinies in the same way as opinion was created and the Press was propitiated in regard to the Maleeka case. Ten thousand times justification has there been during the last five years in the case of our Indian fellow subjects in the Transvaal; and if the pressure which I refer to in the Maleeka case was potent to move the Government in this country to action, to oblige them to interfere with a foreign country over whom we have no power of control, how much more, had I known the trick, would it have been possible to move them into action in regard to our Indian fellow subjects in the Transvaal? I hope I have made it clear to the noble Lord what are the exact points on which I wish to have an answer.

FEUDATORY INDIA

The Bikaner Representative Assembly.

The Maharajah of Bikaner has made a notable concession on the occasion of the celebrations which marked the 25th anniversary of his succession to the *gadi*. His State has made such steady progress of late years that he considers the time is ripe for the introduction of a Representative Assembly in which *ex-officio* and nominated members will be reinforced by those returned by election. The steps which have led to this reform have been slowly but surely taken. At first there was merely an annual Revenue Conference; then in 1908 this was expanded into an Administrative Conference, composed, of course, of officials, but a gathering to which private persons were invited to take part in the deliberations and to submit proposals for consideration by the Durbar. Four years' experience of this practice has confirmed the Maharajah in his idea that the State would benefit by more direct non-official opinion being brought to bear upon the administration, his view being that the Conferences was too official. He has, therefore, decided that a Representative Assembly of a strength of between twenty and thirty members shall be formed, their powers being exactly the same as those of the Viceroy's Legislative Council, with some slight reservations in the matter of the Annual Budget. The model taken is unquestionably the best that could be found, for while an official majority is always secured, the Councillors will have the right of interpellation, of moving resolutions and of introducing private Bills. Freedom of discussion will be allowed but the ultimate power of accepting or rejecting resolutions or recommendations will rest with the Maharajah and the Durbar. This is in accordance with the principles which the

Governor-General in Council follows; and whether the matters at issue are legislation or financial policy the reservation is one to which no reasonable objection can be taken. The non-official members will have an assured position and it will rest with them to justify it, just as similar members have done in the Legislative Council over which the Viceroy presides.

The experiment which the Maharajah of Bikaner is making is one for which we may wish all success. It has been remarked that Rajputana is essentially conservative, and that probably in no State other than Bikaner could a change of this kind be attempted at the present time. But His Highness has confidence in the loyalty and good sense of his people; and as Bikaner has of late made remarkable progress, material and otherwise, this step forward seems perfectly safe. As the Maharajah said in his recent speech:—"No similar Assembly could start under better auspices; it has not only the sincere good will of myself and the members of my administration but also we all welcome its members as partners in the responsible duties of administering and strengthening the State." Rajput rulers in the past have relied mainly upon the exercise of their traditional autocratic powers in carrying out the Government of their States and all authority has been embodied in "The Durbar." The feudatory system is, of course, strong in Rajputana and care must consequently be taken that no offence is given to the deep sentiment which binds Thakurs and others to the Durbars; but the Bikaner experiment has been cautiously framed, and it need not excite any alarm in other Rajput States. In a few years' time the results will declare themselves and they may then be not without their influences on the administrative methods of Bikaner's neighbours. If success is gained the full credit for it will rest with the Maharajah of Bikaner, whose strength of purpose was made clear in his announcement of last week.—*Pioneer*,

Travancore Census.

It appears from the last Travancore Census report that the total population of the province is 3,428,975, of which 1,976,151 live in the littoral division, that is to say, it has for less than one-fourth of the entire area, 58 per cent of the population. The proportion of increase of population for the decade is 16.2 per cent. The density to the square mile for the whole area is 452, but in the littoral zone the greatest density was as high as 1,595 in the Travandrum Taluk, and as low as 68 in the Devikulam or High Range Taluk. The density of population in Travancore is greater than in any part of British India except perhaps Bengal, and excepting Cochin Travancore leads easily among the Native States without exception. The female population is below that of the male, there being a deficiency of 19 to every 1000.

Manganese in Mysore

Manganese Mine owners will be glad to learn that the Government of Mysore is following the other parts of India as regards the royalty payable on ore, and has issued the following Notification:—In accordance with Rule 42 of the Rules for the grant of Exploring and Prospecting Licences and Mining Leases in the State of Mysore, published under Notification Geol. No. 800, dated 29th October, 1910, and in supersession of the rates given in the schedule to those Rules, the royalty on Manganese Ore shall be paid as follows on all ore despatched on or after the 1st of July 1912 and until further notice, (1) the royalty shall be payable quarterly (2) On all ore despatched during any quarter the royalty shall be paid within thirty days of the close of the quarter and shall be calculated on the average market rate (in London) for 50 per cent. ore during the quarter in accordance with the following scale:—Average market rate per unit for 50 per cent. ore, 9d and under, the royalty is one

anna per ton. Over 9d. and up to 10d., two annas per ton. For each additional 1d per unit or portion thereof, an additional two annas per ton. The decision as to the average market rate and the rate of royalty payable for the quarter will rest with the Government of His Highness the Maharaja of Mysore whose decision shall be final. This is a great advance on the old 6 annas rate, and brings considerable interest just now when the Home market is rising steadily, and has touched 10d. C I F, London recently, so the change dated last month is particularly opportune. *Daily Post.*

Education in Bhavnagar.

The chapter on Public Instruction in the Bhavnagar administration report, is interesting reading. The State has for many years shown itself to be keenly appreciative of the advantages of education and devoted large sums for promoting education of all kinds among its subjects. The Samaldas College is a first grade college teaching up to the M. A. standard and has 124 scholars on its rolls. There is only one high school in the State. Perhaps if one or two more High schools are established, the College will be able to prove itself of more utility to the population proportionately to the expenditure incurred on it. It is a mistake to stint on secondary education while spending large sums on University education, for pupils must pass through a secondary school before they pass to a college. We are glad to see that the State pays special attention to girls' education, the ruling family itself setting a bright example of enlightenment in this respect. The Bhavnagar Durbar has shown itself to be well disposed to the Depressed Classes Mission. The report notes with satisfaction that the erection of school buildings in places where they do not exist, is becoming a popular form of private benevolence among the well-to-do citizens of the State. Two such schools were built in the year under report with the support of the Durbar.—*Indian Social Reformer.*

INDUSTRIAL AND COMMERCIAL SECTION.**Making Wood from Waste paper.**

There is an old saw to the effect that

"Nature works in circles,

Every one agrees;

Trees grow out of doors,

Doors are made from trees."

Some one with a gift for rhyming may add another verse about paper being made from wood and wood now being made out of old paper. An inventor has perfected a machine which does this. He takes old newspapers and straw and puts them through his machine and they emerge in the shape of artificial boards of any desired length or thickness suitable for building material, for railway ties, or for furniture.

For many years the ever-increasing demand for white paper for newspaper printing has been making serious inroads on the available forests of the world, and the problem of where to find timber to meet the demand has been growing more and more menacing. This also applies to wood needed for building construction, furniture and railway ties.

Turn out is fair play, so to-day old newspapers are being converted back again into wood, which is claimed to be even more suitable for many purposes than natural timber. Specimens of the new artificial wood that have already been made out of old newspapers and straw vary in thickness from an eighth of an inch upward, and range from narrow moulding to boards four feet wide and twelve feet long. The inventor claims that it can be impregnated with certain chemicals to render it fireproof, can be made waterproof, can be premeated with any desired colour during manufacture, or can be given a highly polished surface finish. He further asserts that it is susceptible to all kinds of tool treatment, is free from knots with their consequent waste, and it can also be used in embossing.—*Science Sisters*

Manufacture of Artificial Silk.

M. G. Ditzler, of Nerviers, Belgium, has patented in England a new method for the manufacture of artificial silk which is accomplished by dissolving cellulose in ammonical copper oxide, or other suitable solvent having a copper base. The operation is carried out in a vacuum, or in the presence of an inert gas, or an isolating liquid, and is continued free from the action of air, or any other oxidising agent, up to the time of its precipitation or coagulation.

Novel take-up Motion for Looms.

Mr. R. E. Starkie, of Burnley has devised an apparatus for letting back in the take up motions for looms consisting of a curved arm formed with ratchet teeth at its extremity, and placed between the boss of the lever, and the ratchet wheel of the taking up motion. The teeth of the curved arm engage with the teeth of the ratchet wheel so as to cause a let-back when the weighed end of the device falls against an adjustable table stop on the liberation of the ratchet wheel.

Opening and Cleaning Cotton Fibres.

Mr. A. Marr has protected quite recently improvements in machines employed in the preliminary opening and cleaning of cotton, and other fibres, such as openers, scutchers, and carding engines, in which a cylinder covered with Garnett or other toothed wire may be employed. The invention consists in dispensing in such machines with flats or rollers as commonly employed, and in constructing the machine with a perforated cylinder covered with Garnett wire, or similar covering, through the perforations in which a current of air may pass from the interior to the exterior, a close fitting casing around a portion of the cylinder with motive knives on the underside at intervals to strip, or partially strip, the cylinder and a roller placed near to each motive knife to receive the fibre stripped off by the knife, and replace the fibres again upon the cylinder.

Bogus Companies in India.

The *Hindi Punch* of Bombay has an excellent and telling cartoon illustrating the position of bogus companies in India. They are made to figure as a big sized spider balancing in the centre of its vast web and the foolish bee, hovering about the place with bags of money. There is no doubt that but for the extraordinarily credible people, bogus companies in this country—particularly in the Panjab—would not flourish. But we hope that the Provident Fund and Companies' Acts will sound a death knell to most of these. Many of the so-called benefit societies as conducted in the Panjab, ought not to exist if the people were a little discriminating.

Industrial Survey in the Provinces

Referring to the Order of the Government of Bombay instituting an industrial survey of the presidency, the *Bengalee* remarks—It seems to us that in this matter the example of the Government of Bombay may, with advantage, be followed by other Local Governments. Bengal has a large number of industries in respect of which an industrial survey of the kind that has been undertaken in Bombay would be of the greatest value. Like Bombay we too have our hand loom industry, an industry which at present is handicapped by competition with goods turned out by mills, but which under suitable conditions may yet have great potentialities. There is again the sugar industry which is in a more or less languishing condition but which all who know anything about the facts of the case agree in holding ought to have a great future. And these are only the type of the rest. An industrial survey, confined in each case to one particular industry, would, in our opinion, be of the greatest value not only in ascertaining the exact condition of the industries but finding out what precisely has got to be done. We earnestly hope the Government of Bengal will in this matter take a leaf out of the book of the Bombay Government.

Machinery for India.

Sir Theodore Morison, in an address to the London Chamber of Commerce, referred to the development of India as a manufacturing country. He also suggested that facilities should be given by our Manufacturers, as was being done by those of other countries, for the acquirement of practical training by young Indians, on the ground that in starting or developing industries in India orders would naturally be given for the machinery of which they had practical knowledge. We have since received from Mr Frederick Noel-Paton, Director General of Commercial Intelligence for India, a reprint of an article in the *Indian Trade Journal*, in which he also calls attention to the increase of manufactures in India, which has become the largest single purchaser of machinery from England. Difficulties are, however, encountered even by wealthy and intelligent native gentlemen in obtaining information as to the approximate capacity and cost of the complete installation requisite for a given industry for which raw material and demand are present. To procure and supply information of this kind Government officers have been appointed who travel India and receive *bona fide* inquiries from persons qualified, financially and by intelligence, to establish useful works. But, Mr Frederick Noel-Paton says, they are handicapped by the absence of co-operation among British makers of machinery. Many engineers in England make only part of the appliances required in a given industry, although the several firms who produce complete appliances for such industry are known to each other and are prepared to work together when a definite order is in sight. It is therefore suggested that it would be worth the while of British manufacturers to assist officials in obtaining full information about all the appliances necessary for a particular industry. In most cases the manufacturer knows what other appliances are required and what their power or capacity should be. In such cases it would be sufficient if

he would drop a line to the makers of the complementary plant, saying that a certain official required information as to plant for such-and-such an industry, stating that the writer was sending drawings and approximate quotation for such-and-such appliances, and asking that his correspondent should forward similar information about such-and-such complementary appliances of corresponding capacity. We cordially commend this proposal to the careful consideration of British manufacturers of machinery. There can be no shadow of a doubt that the Indian market for machinery will develop by leaps and bounds and that, in the absence of co-operation amongst our manufacturers, a good deal of the business will continue to go to those countries where such co-operation has been carried further than in England and where co-ordination between officials and manufacturers is more highly developed.—*London Chamber of Commerce Journal*.

Motor Cars in India.

One of the features of the trade returns of India in recent years has been the remarkable increase recorded in the importation of motor cars. In 1909-10 the value of cars received at Indian ports was £317,000, while in the following year the total was stated at £488,000. In 1911-12 the figure rose to £669,000, and although a portion of the increase during that period may be attributed to the Durbar, the expansion on the whole is due to the popularity which the motor car has attained in this country. Of last year's imports cars to the value of £516,000 came direct from the United Kingdom, so that British makers must have secured large profits from the Indian demand. This trade is certain to go on increasing since a notable tendency is apparent to substitute the motor for the horse. The use of the motor vehicle for trade purposes in India has, so far, been limited, but there is a field open here which will no doubt prove of great importance to manufacturers in the near future.—*Indian Agriculturist*.

Child-Bearing Women in Factories.

On the subject of the employment of women before and after childbirth, we still get evidence of evasions of the Factory Act. On account of poverty, sometimes perhaps because of greed, some women seek work and secure it before the termination of the four weeks during which the law prohibits their employment. It is not a difficult matter to evade the law on this particular point; the restriction is very loosely construed, and it will be impossible to stop this practice of returning to the mill too soon unless some system for the registration of expectant mothers be adopted, as already is done in one or two of the continental countries. The fact might as well be faced that, despite some so-called authoritative opinions to the contrary, an extensive employment of married women leads to high infantile mortality. What is needed is a better regulation of the conditions, an alteration of the law relating to child-bearing women, and the help of municipalities in providing proper places for the care of young children while the mothers are earning bread for them. Not infrequently, municipalities spend money in less useful social service.—*Textile Mercury*.

Tata Steel Works.

It is stated that the Tata Steel Works are progressing in a decided fashion. Including forward orders accepted, 40,000 tons of pig iron have already been sold, of which the proportion disposed of in India is less than five per cent. Japan is at present the company's biggest customer and it is as much as they can do to supply demands from this quarter since English supplies were curtailed owing to the labour troubles. By the end of July, 13,000 tons out of 38,000 tons ordered for export have been shipped. The works are now capable of a monthly output of 5,000 tons, of which Japan will take all but 300 tons, 200 of the latter being for Australia and the other 100 for Ceylon.—*Indian Textile Journal*.

Artificial Rubber.

Rubber, we are told, is to be made from starch. In making it from this material we shall not only be withdrawing land now used in raising food crops (potatoes and cereals) as the raw material. The question is how long this will be desirable and possible. As we increase in numbers the difficulty of securing adequate food supplies is bound to increase. Moreover, there is a direction in which there will be a use for starch in the future which also may militate against its use as the raw material of artificial rubber. The only way in which it will be possible to meet requirements will be to ferment starch and sugar produced for the purpose in hot countries where large crops can be grown. All the indications point to a shortage of sugar and starch in the future and to an increase in their value.

But, after all, in using starch to make rubber we shall only be copying the plant, as this also makes the rubber more or less directly from starch. It is not a case of utilizing a waste product—such as coal-tar was when dye-stuffs were first made from it, and such as it would be still in the absence of the colour industry—but a material is to be used which is of particular value for other purposes already. Ethically we shall probably be making a mistake in not availing ourselves to the full of the activity of the plant, but, apart from this, it may well be that, when everything is taken into account, the plant is able far more effectively than man to make rubber from starch. It is of the utmost importance, from this point of view, that the production of natural rubber should be made a scientific industry. In the case of indigo the margin in favour of the artificially made material is not so very great; had the planters taken time by the forelock it is not improbable that they would have held their own. It will be well if rubber planters take the lesson of indigo to heart and learn without delay to set and keep their house in perfect order.—*Times*.

Indian Silk Industry.

THE *Civil and Military Gazette* says that the President of the Royal Silk Association, London, writing to Mr. Jackson, Superintendent, Tata's Silk Farm, Bangalore, which is now worked by the Salvation Army, says that a bale of their silk was shown at a recent London Silk Exhibition and that it attracted the attention of many visitors, including the King and Queen and other members of the Royal family. The opinion was also expressed that it was possible to increase the demand for those silks in European markets, and he was inclined to think that if the silk were sent to Italy or France in a raw state and thrown by one of the best French or Italian throwsters it would prove quite a good class of serviceable silk.

The Bombay Commercial College.

HIS Excellency the Governor of Bombay has received the following very generous promises of support towards the establishment of a Government College of Commerce in Bombay. Sir Jugmohandas Varjesvandas, Rs 2,25,000 towards the founding of a professorial chair to bear his name. The Trustees of the Wadia Charities—Port Trust bonds yielding Rs. 4,800 per annum towards the founding of a chair to bear the name of Mr. N. M. Wadia. Sir Chinubhai Madhavlal, Rs 1,00,000. The Bombay Chamber of Commerce, Rs 1,500 per annum. The Millowners' Association, Bombay, The Indian Merchants' Chamber and Bureau, Bombay, The Bombay Native Piece goods Merchants' Association, and the Mill-owners' Association, Ahmedabad, Rs 1,000 per annum each. The income thus provided will amount to about Rs 23,000 per annum, and Government are prepared to contribute an annual grant of Rs 15,000. The liberal and most gratifying support which the proposed college has thus received will enable it to be established, although additional funds will be required to make the institution complete in all respects and to provide scholarships.

Four Days for Six Months.

The American Consul-General at Callao, Peru, reports that the Amazon Pacific Railway should be completed at least by the time the Panama Canal is to be officially opened for the ships of the world, and will enable direct shipment of United States products to be made to the Amazon regions via the Panama Canal, the Pacific Ocean, and the port of Callao, thus materially increasing the commercial importance of the port. The effect of any transcontinental Peruvian railway would be to permit an interchange of the eastern and western products of Peru within three or four days, instead of their having, as now, to undergo a journey of some 20,000 miles via Europe, covering a period of six months or more.

State Technical Students.

The Government of India have this year sanctioned the award of ten State Technical Scholarships to the following candidates for a course of training in Europe in the subjects noted against each:—

Mr. Tombat Sakharama Rao, Electrical Engineering; Mr. D. Sadashivam, Practical work in Applied Chemistry and the manufacture of textiles; Mr. D. N. Nagarkatti, paper making; and Mr. E. C. Henriques, architecture,—all from Madras, the last to undergo a training for two years in India and then proceed to Europe for a third year to complete his training.

Mr. P. R. Duncan, Mechanical and Electrical Engineering; and Mr. Chandra Sekhar Sarkar, Mechanical Electrical Engineering, from Bengal.

Mr. Lakshmi Das Kochli, Tanning, from the Punjab.

Mr. Maung Ba Chitt, Mechanical and Electrical Engineering subject to his passing the B. Sc. Examination, from Burma.

Mr. B. Das, Mechanical and Electrical Engineering, from Bihar.

Mr. K. Mitral, Electrical Engineering, from the Central Provinces.

AGRICULTURAL SECTION.

Indian Hemp.

The Agricultural Department, Bombay, has issued as a press *communiqué* the following extract from a letter written by Mr. Alfred Wigglesworth of Messrs. Wigglesworth and Co., 82, Fenchurch Street, London, E. C. dated 17th May, 1912, addressed to Major A. T. Gage, I. M. S., Superintendent, Royal Botanic Garden, Calcutta.—We think that a very great future could be made for the hemp trade in India if they would adopt better methods of preparation. For instance in the Pilibhit district there is no earthly reason why they should "ret" this material in muddy water, if not in mud, as it results in deteriorating the strength of the fibre and in filling it up with such volumes of dust that some of the European countries have actually had to legislate against its use except by the introduction of expensive dust collectors, to save the working people from being injured by breathing the atmosphere. In the Godavery Delta the practice is at its best, also in Gopaulpore and Bengal, and if they could be studied and introduced to the rest of India, then we should have qualities of hemp of greater uniformity, and a much higher price would be obtained for the product. In Jubbulpur they grow a fine class of fibre; sometimes it is prepared in fresh water and is free from dust, but at times it is also prepared in muddy water and the fibre is deteriorated and weighed with dust in consequence. Owing to the scarcity of European hems during the last season, the demand for Indian fibres has been very great and the prices have gone up to a figure unheard of in the history of the trade. All this should encourage the native grower to enlarge the production and to improve his methods.

Cattle Breeding

Two new experiments are being conducted at Woburn that will be of interest to those who undertake the breeding of cattle. One of these is in connection with tuberculosis and the other with the feeding of calves in their earliest stages. At present there are thirteen yearling animals, and two calves born this year, all of them being the offspring of cows which had reacted to the tuberculin test shortly before parturition. The cows were allowed to calve in premises at Woburn, and immediately after birth the calf was removed from its mother and taken to a separate farm, one mile distant. All the milk used for feeding the calves has, before use, been raised to a temperature known to be certainly fatal to tubercle bacilli, and both indoors and at grass the animals have been strictly isolated. The calves have all been tested twice for tuberculosis, but were found to be perfectly free of the disease. The intention is, eventually, to kill the animals, and ascertain by careful post-mortem examination whether they are free from tuberculosis or not.

Experiments in Flax.

The Agricultural Research Institute at Pusa has issued (Bulletin No 30 of 1912) a Report on the Flax Experiments conducted at Dooriah during the year 1911-12 by Mr. E. M. Vanderkrogh, Flax Expert to the Behar Planters' Association. The Report shows a profit amounting to Rs. 63 per acre. It is stated in Mr. Bernard Coventry's Introduction to the Report that in spite of this satisfactory result, planters are not inclined to take up the growth and manufacture of flax, because of the large amount of expert knowledge and capital required in the industrial side which are not easily commanded by the grower. The authorities at Pusa have therefore decided to conduct separately in future the operations of the grower and the manufacturer in order to determine the profits to be earned by both.

Farming with Dynamite

The latest rural novelty is farming with dynamite. According to an article in the *World's Work*, it has "grasped" the United States and "is spreading throughout Canada and Mexico like a prairie fire." A special dynamite is prepared for the purpose. It is in the form of "sticks" and perfectly safe to handle so long as common sense is displayed. The method is exceedingly simple. A long auger drills a hole vertically into the ground. The stick or cartridge carrying its length of fuse, which projects a few feet above the surface of the ground, is then shipped in. The hole is now filled up with soil, which is rammed down tightly by the aid of a wooden stick. Then the fuse is lighted, and one and all retire until the blast has done its work. The system has come into extensive vogue for ploughing fields deeply. The men advance one behind the other in rows so many feet apart, and at regular intervals the charges are tamped home. When the cartridges have been laid, the men proceed across the field in a line, one to each row, lighting the fuses as they move forward. Before they have proceeded half-way across the tract the charges first fired go off, sending a plume of earth into the air. The charges ignite in rows one after the other. When the field has been treated in this manner the plough is run over in the usual way and the crops are sown. Possibly, what at first sight appears to be the strangest application of dynamite is for the purpose of planting trees. Yet its success in this connexion is said to be peculiarly remarkable. With dynamite a large clean hole is blasted out, and in addition the soil on all sides is loosened for five or six feet. When the tree is planted the young and tender roots force their way without effort through the crevices, sucking up nourishment, and commence to grow from the moment they are set, without any retardation whatever.—*The Indian Agriculturist*;

Departmental Reviews and Notes.

LITERARY.

TRAVELLING FREE LIBRARIES.

The Secretary of the Travelling Free Libraries writes:—Our plan is that a box containing a set of about fifty volumes will be given in charge of a gentleman living in a chawl occupied by the people of the backward classes. This gentleman will be requested to issue these books to the people in the chawl free of any charge and also to try his best to persuade them to make their use. After two or three months a fresh set of books will be given to these people, the old set being removed to some other place. Thus, if we give five sets of books in a year to one chawl and start this work in twenty-five centres we must secure 125 sets or 6,250 volumes. To purchase this number of books would mean an expenditure of about Rs. 5000. But we shall not be required to spend this sum if those who have some Marathi or Gajrathi books with them will be ready to part with some and place them at our disposal for this purpose. Editors of newspapers and magazines and book-sellers can help us a great deal in this matter. A man of good means can, without difficulty, give us a set of fifty or hundred books and even people of the middle class can very well spare a few volumes. We hope that all our countrymen will extend a helping hand to us in this undertaking of enlightening the masses that are groping in the dark.—*The Collegian*.

NAMES OF CHARACTERS.

A writer in a contemporary compliments Thackeray on the felicity of the names he gives his characters. The compliment is only partly deserved, for, like Dickens, Thackeray often made the names incredible, and Trollope, who has been so much praised for the naming of his characters,

became preposterous at times. Perhaps the happiest name in English fiction is that of Meredith's "Egoist"—Sir Willoughby Pattern. But novelists have not only given apt names to their characters, some have shown admirable taste in the names they assumed themselves. "George Eliot" was a happy inspiration, for Marian Evans would sound highly inappropriate. The best thing in this kind, however, was Balzac's addition to his name of the honorific particle Honore de Balzac is a splendid name, and it is the "de" which brings out the effect. In his case the feeling for names so finely exemplified in the *Comedie Humaine* must have been hereditary, for it was his father who turned the commonplace name of Balsac into Balzac. The father of the Brontes was not less wise in preventing the name of Prunty from becoming famous.—*Madras Mail*.

POPULAR INTEREST IN LETTERS.

Sir Frank Newnes, Bart, presiding at the Annual Meeting of George Newnes, Ltd, said that the year had been a highly satisfactory one, the profits amounting to £47,278-10 as against £33,360-16-1 last year. *Tit-Bits* had shown record sales. The *Strand Magazine* had also shown handsome increases in circulation. That observation applied also to the *Wide-World Magazine* and the *Grand Magazine*. The Newnes sixpenny novels had also sold in unprecedented numbers. No fewer than 25,000,000 copies of this popular series had been sold since they commenced the publication of that class of literature. The year under review had been a very prosperous one, but in addition to that they had only now reaped the benefit of the changes which had been effected during the past five or six years in the organisation of some of their most important departments.

EDUCATIONAL

A COSMOPOLITAN ACADEMY.

The University of Paris outdoes all the other academies of the world in attracting studious youths from other countries. Of the 18,000 students in Paris no less than 3,500, or nearly one fifth, are of other than French nationality. Of these foreign students there are 1,303 attracted by the Faculty of Letters, 953 by the Faculty of Law; Medicine has 329 women and 476 men from abroad. There are 1,600 Russians at the University of Paris. If to the foreign contingent at Paris be added the 2,000 foreigners attending provincial Universities, it will be seen that France is feeding with culture and knowledge 5,500 students who are not her own children.

THE HINDU UNIVERSITY

A meeting of the executive committee of the Hindu University Society was held at the residence of Dr. Sunder Lal. Several members from the mofussil were also present. It was stated that nearly ten lakhs had been realised. It was resolved that fortnightly statements recording the progress of the movement should be issued to the press. It was decided to give the honorary secretary the help of a whole time assistant, and it is believed that the choice will fall on Babu Brahmananda Sinha of Lucknow. Letters from some Jain and Sikh gentlemen asking for arrangements for instruction in their religious systems in the coming university were considered and the committee resolved to recommend to the University Society the making of provision as desired in the aforesaid letters. A sub-committee was appointed for redrafting the constitution and another for collecting funds. Among the members of the former are Mrs. Besant, the Hon. Pandit Madan Mohan Malaviya, the Hon. Dr. Sunder Lal, Mahamahopadhyaya Pandit Adityaram Bhattacharya and Babu Bhagavan Das.—*Leader*.

THE POSITION OF INDIAN ENGINEERING STUDENTS.

A number of Indian engineering students in England have issued a letter in which they protest against the system of recruitment of civil engineers for the Indian Department of Public Works. In the course of it they say:—Formerly the Imperial engineers were trained and taken from the Royal Indian Engineering College, Coopers' Hill. There was no limit placed on the admission of Indian students, but it was a question of merit. After its abolition the present system of selection by the India Office came into force. The Selection Committee selects from the recruits, placing a limit of 10 per cent of Indian students, and the system has fallen from bad to worse. Lord Morley said, "Deserve and desire." The Indian engineering students has done full justice to this axiom of Lord Morley. They have done much more than could be expected of them in a strange land and in a foreign language. One can readily understand what this percentage limit and this mode of selection means to the intelligent manhood of India. Each student's life and livelihood is involved. In his own country he has not an atom of chance to enter any department of engineering. Taking railways as an example, the staffing is fully monopolised by Europeans, and Indian students cannot even enter into the Convenanted Service, for here the English engineers are sent out from this country with an agreement for a certain period and after the expiry of their time most of them are taken into the permanent service. If justice is to be vindicated, let the following clauses be inserted for the governing of the Department:—(1) A 50 per cent share in the selected candidates for Imperial service and an increase in the Indian applicants' age limit from 24 to 25 years; (2) the abolition of the Convenanted service, and to recruit temporary engineers from the England trained Indian engineers and from the local colleges; (3) a proper share in the engineering establishment of all the railways.—*Manchester Guardian*.

LEGAL.

A LEGAL CONUNDRUM.

In the Madras High Court, before Mr. Justice Sundara Iyer, and Mr. Justice Sadasiva Iyer, the interesting question whether a man who has been missing for some time is to be presumed to have been dead or alive at any particular period, arose in a case which came up in second appeal before this Bench. The husband of the plaintiff in this case went abroad 36 years before the suit. The deserted wife was living with her father-in-law for some time. He, however, died five years later, and ultimately the question that arose in respect of the rights of plaintiff, thus doubly left alone, to the properties of her husband's family was whether on the date of her father-in-law's death the husband was to be presumed to have been alive or dead. If the Hindu husband was to be presumed to have been alive, plaintiff would take the property through him, and that would give her a complete estate in it. If otherwise, the father-in-law having been the last male holder, the reversioners would take the estate, plaintiff being entitled only to maintenance out of it. The woman's pleader argued that her husband should be presumed to have been alive at the critical date. The contention of the plaintiff was that her father-in-law having died within five years after the disappearance of her husband, he must on that date be presumed to have been alive and have passed the estate to his deserted wife. Their Lordships held that qualification of section 107 by virtue of the succeeding section did not warrant any presumption that the man was alive at any particular moment, though within seven years. It was again argued that on the particular facts of the case such a presumption might be drawn, but their lordships held that apart from the law the particular facts of the case did not justify them in drawing any such conclusion.—
The Panjabee.

LAW AGAINST GAMBLING AND BETTING.

The law having been found inadequate in Bengal to suppress the evil of "cotton figure gambling," fresh legislation will be undertaken to cope with it. The Bill will also prohibit other forms of gambling and betting.

SPECIAL MAGISTRATES FOR CHILDREN.

An influentially signed memorial has been sent to the Home Secretary urging a number of administrative changes with regard to juvenile courts and probation.

It is urged that special juvenile court magistrates should be appointed, selected for their knowledge of social conditions and understanding of boys and girls of all ages, as well as for their powers of personal influence and organisation. Juvenile courts should be held, not in or near police or other criminal court buildings, but in or quite close to the remand homes.

Each juvenile court, it is also urged, should have at least one woman and one man probation officer devoting their whole time to the care of juvenile probationers. Whenever a child is arrested the probation officer should approach its home as a friend of the child, and try from the first to secure the co-operation of the parents.

Where locally possible, the Court should secure the services of volunteer (unsalaried) probation officers, and also enter into co-operative relations with all religious and charitable societies and persons likely to help in their regenerative work.

The remand homes should preferably be in charge of a gentlewoman with the right kind of experience, and the staff should include specially qualified educators.

Those signing the memorial are:—

Earl Grey, Lord Edmund Talbot, Lord Henry Bentinck, Sir John Gorst, Sir Henry Toulmin, Mrs. Barnett, Miss. Isabella Baker, Miss. N. Adler, Miss. Constance Smith, Mr. W. H. Dickinson, Mr. Chas. E. B. Russell, Mr. J. H. Whitehouse, Mr. W. F. Cobb and Mr. Arthur St. John,

MEDICAL.

POISONOUS BORAX IN YOUR FOOD.

Borax, or some preparation of it, is a common food preservative. Its most evil use is in connection with milk, which may be given to babies. Dr. Andrews Menel has just proved what an unmitigated evil it is. A three month's old child was suffering from stomach trouble, and the doctor placed it on a special artificial diet. Then fits began. A local trouble was remedied and then the fits were accompanied by diarrhoea. Consumption was now suspected. Then the doctor discovered that "borax and honey" was put on the child's soothing teat. The child was having thirty fits in the twenty-four hours, and was at the point of death. The borax and honey was thrown away, the fits vanished, and the stomach trouble disappeared, while the child is now perfectly well. These facts point their own moral.—*Science Stylings*

THE CULT OF THE SUN BATH

Medical opinion has not perhaps encouraged so widely as in Germany the cult of the sun bath, which now almost assumes the proportions of a fashionable craze. In Berlin, the *Hospital* points out, the popularity of the sun bath is extraordinary, and in the best districts of the city the most modern houses possess roof-gardens and erections which are to all intents and purposes lineal descendants of the Roman Solariums. In such delightful wooded resorts as the Grunewald and Wannsee, and also around the lakes between Potsdam and Berlin, may be seen large numbers of sun-bathers both in single spies and in club battalions. In England, since the days of the celebrated and isolated case of the lady of the Park lane balcony, not a great deal has been heard of the therapeutic value of the sun-bath. But taken seriously and thoroughly there is no question, our contemporary affirms, that a moderate degree of insolation is well worth trying as an adjunct to the hygienic side of a holiday.—*Times of India*

A GREAT SCHOOL OF HEALTH.

Lady Paget makes the following suggestion in an article in the *Nineteenth Century*:—

Why should not the Crystal Palace be made into a great School of Health for all manner of people, for all ages from infancy to childhood, for girls and boys, for young mothers on to middle and old age? It would be a school with practical demonstration in every thing pertaining to health.

Demonstration in cooking, gymnastics and dancing, sun and air baths, and every kind of water cure. There would be air huts for those who wish to learn the simple life and nature cures; no place could be more perfect for this ideal way of recovering health than the Crystal Palace, as on rainy days it would provide a shelter and amusement and exercise. Hygienic clothing would be taught and hygienic living in its best sense. The theme and scope are so large that they would fill volumes, and yet so simple that the rules once learnt become a second nature to those who have thoroughly grasped them.

The writer suggests also that the palace should include a great Empire Club.

WOMEN'S MEDICAL COLLEGE.

There is an agitation afoot in England to establish a separate service of lady doctors in India. We are glad to see from a press communication that it is realised by the authorities that the provision of a Women's Medical College in India, must precede the establishment of such a service. Lady Hardinge has, accordingly, started a project for founding a Medical College and Hospital for Women at Delhi, and has enlisted the sympathy of several ruling chiefs for it. It is a question whether a College in Delhi will be freely resorted to by women from the remoter parts of the country, but the movement is in the right direction, and it will doubtless be followed by others to establish provincial Colleges. Bombay at any rate is fully ripe for an institution of the kind.

SCIENCE.

A NEW LIGHT MOTOR TRI-CARRIAGE.

The ever-increasing developments in regard to motor traction for a variety of purposes have induced greater attention to be paid to the light three wheeled vehicle which is more handy than a motor-car and more useful than a motor bicycle. This is particularly the case when it is applied to tradesmen's purposes where express delivery is urgent, and where a cumbersome vehicle is not desired. One of the latest and most efficient vehicles of this type is the Wall tri-carriage. It is built on the lines of the familiar light car carrying the engine in front, with shaft transmission, differential axle, and so forth. There the similarity ends. At the same time, the carriage has none of the drawbacks of the ordinary motor tri-car, where the excessive weight and the wear and tear on the back tires nullify any benefits over the four-wheeled carriage which it may possess. The Wall tri-car is well-conceived, smart little vehicle for the purpose for which it has been expressly designed—namely, light goods delivery; and the many features which it possesses, and which have been duly patented, cannot fail to impress all those firms to whom the expeditious and economical, as well as safe, delivery of goods is a vital consideration. It is extremely convenient in handling, as it can turn in its own length; the control is absolute, and the cost of operation is low, the fuel consumption averaging about fifty miles per gallon. Moreover, it is light and easy on the tires. It is the cost of upkeep, particularly the way in which tires are cut up, that causes the average tradesman to abstain from adopting a light motor vehicle for his business; but in this particular vehicle all these drawbacks appear to have been greatly lessened.—*Chamber's Journal*.

THE MARCH OF SCIENCE.

Scientific investigation of the ocean's bed and of aquatic plants and animal life will be made comparatively easy, says the "Philadelphia Record," by the use of a glass-bottomed boat that has just been launched at Camden, U. S. A. Through the glass bottom and the apparatus with which the boat is being equipped it will be possible to see clearly to a great depth, and the boat will be of especial value in locating wrecks at the bottom of the sea. From stem to stern the bottom of the novel craft is laid with plate-glass fully one inch thick and divided by steel frames into sections securely sealed to make it absolutely watertight. An ingenious arrangement with a specially constructed submarine radio light has been devised for illuminating the bottom of the sea and bringing objects resting or floating there into clear view by throwing light down through the water. Scientists who have inspected the boat say that it will show at the bottom of the sea many living creatures hitherto unknown.

INTRINSIC LIGHT OF STARS.

M. Nordmann, of the Observatory of Paris, has made some interesting calculations of the intrinsic light of a number of stars, based on the results he had previously attained in regard to their effective temperatures. The brightness of a star, as seen from the earth, does not depend wholly upon its size and distance. Thus M. Nordmann finds that Sirius and Vega emit light the brightness of which is 6,000,000 candle power per square centimeter, while at the other end of the scale the light of Aldebaran amounts to only 22,000 candle power per square centimeter. The intrinsic brightness of Vega is according to this calculation, 19 times that of the sun. If Vega were of the same size as Aldebaran and at the same distance from the earth, the former would appear to us over 200 times as bright as the latter.—*Science Siftings*.

PERSONAL.

THE HON. MR. G. K. GOKHALE, C. I. E.

Mr. Gokhale left England for South Africa on the 5th instant to examine the question of Indians in South Africa, on the spot. Prior to his departure from Waterloo, a large gathering of Indians presided over by Sir Mancherjee Bhownagree, bade him farewell. The President said that Mr. Gokhale went to South Africa accredited with the confidence of the whole people of India to study the question of finding a solution to the Indian problem, and to get the public and responsible officials to understand that this question was not only vital to India but also to the unity of the Empire which they themselves desired.

Mr. Gokhale, responding, said he was going on the invitation of his countrymen in South Africa. His friend, Mr. Gandhi, was responsible for the step, but he felt it a great privilege to receive an invitation from those who had been making a brave stand against aggression, and for a position in the Empire compatible with self respect as civilised beings.

His object was primarily to acquire first-hand knowledge. He also hoped his visit would be accepted by his brothers and sisters there as an indication of the deep interest which India was at last taking in their struggle. The position was daily getting more difficult and it behoved the leaders to proceed with deliberation and care in advising Indians on this question. If things did not improve within a reasonable time he hoped to qualify himself by the visit to advise his countrymen in India what they ought to do to give more assistance. He was not dependent, however, for he believed that when the state of India was known to South African statesmen they would rise to the occasion and realise that a solution to the problem was essential to the good of the Empire.

THE LATE DR. A. H. EWING.

We are grieved to learn the death of Dr. A. H. Ewing, for several years Principal of the Allahabad Christian College, on Friday the 13th at the Civil Hospital, Allahabad. Dr. Ewing was barely 48 years of age. He had a high reputation as a Sanskrit scholar, was a member of the Senate of the Allahabad University and had acted as Vice Chancellor. Dr. Ewing was greatly respected and was very popular with the students, and the Allahabad Christian College greatly developed and prospered under his guidance. His death has been a severe blow to his brother Dr. J. C. R. Ewing, Principal of the Forman Christian College, Lahore, and Vice Chancellor of the Punjab University, to whom we offer our respectful sympathy.

MR. RATAN TATA.

Seldom has a son been truer to the lessons of his father's life than Mr. Ratan Tata is to those of J. N. Tata. Not only has he, in conjunction with his elder brother Sir Dorab, most faithfully set himself to give effect to his father's schemes of philanthropy and enterprise, but on his own account he has given away in discriminating charity large sums of money which have gone to benefit many a deserving object. Mr. Ratan Tata has just announced a donation of 6,000 guineas (Rs 94,500) for an Indian memorial to General Booth. This money along with other donations that are sure to come will be expended, we presume, on the most worthy object of the relief of poverty and suffering Mr. Tata has given Rs 75,000 to the Indians in South Africa. He has given a generous sum to the Servants of India Society. Mr. Ratan Tata is verily one of the chosen of God.

THE HON. MR. MUDHOLKAR.

The Hon. Rao Bahadur R. N. Mudholkar has been elected President of the Indian National Congress to meet at Dalkipore in December next.

POLITICAL.

CO-OPERATION

Speaking at the Servants of India Society's Home on co-operation for national work between officials and non-officials, the Hon. Mr. Hill, a member of the Bombay Government, paid a high compliment to the members of the Society who did famine work in Gujarat and Kathiawar, and then said of the hon. Mr. Gokhale:

"To my mind Mr. Gokhale can lay claim to a title to greatness more by reason of the formation of this small body of self-denying persons than by almost any other of his public acts, and I feel that so long as this Society adheres to the lines laid down for it by him, it will be one of the greatest monuments to Mr. Gokhale's career."

SIR GEORGE CLARKE ON MOSLEM EMPIRE.

Sir George Clarke, the Governor of Bombay, addressed the following farewell sympathy to the Moslem Imperialists assembled at Poona:—

"It is natural that the fortunes of Islam abroad should concern you but I do not think you always realize how deeply they also concern Great Britain. In my life-time we have spent blood and treasure lavishly in defence of the integrity of Turkey and later we again intervened at a crisis in her affairs. Do not forget that the issue of the present unfortunate and unnecessary war must be of far less importance to Turkey than the internal troubles and dissensions which are now causing us great anxiety. Remember always that the integrity and independence of Persia would have disappeared long ago, but for British diplomacy and the support which lay behind it and to-day there is no power so sincerely desirous for the regeneration of Persia and the avoidance of foreign intervention as Great Britain. Our wishes are identical with yours but we are faced with difficulties which you do not entirely recognise. You can trust us to do all that is possible within the limits which the world forces impose upon us.

LOCAL AUTONOMY.

A resolution has been issued announcing the assent of the Secretary of State to the grant of enhanced powers to local governments in respect of the creation of permanent and temporary appointments, the grant of fees, rewards, or honoraria.

SIR JOHN HEWETT.

The *Madras Mail* says: Sir John Hewett's administration has been remarkable for many things, but perhaps most of all the impetus given to education generally, and to technical education in particular, for the great interest taken in industrial and agricultural problems, and for the judicious treatment of those political evils which naturally threatened in 1907-09 a Province lying between the storm centres of Bengal and the Punjab. The United Provinces have generally been fortunate in their Lieutenant Governor but Sir John Hewett's predecessor was in some respects incapable of maintaining the high standard and a second administrator of the same kind would have been a serious misfortune. As it was, the new Lieutenant-Governor tightened up the machinery of administration before it had fully felt the effects of the tendencies of the preceding administration. He has been one of the most independent, and in a legitimate way one of the most innovatory, of administrators, and not only have the United Provinces prospered under him but in various ways he has suggested lines of enquiry and modifications of method to other Provincial Governments. His organising ability has always been acknowledged, and it was that which specially marked him out for his important special duties in connection with the Coronation Durbar. How successful his work there was is a matter of common knowledge. Sir John Hewett has deserved well of the United Provinces and of India, and we hope that after retirement he will have opportunities of adding in other ways to the work he has done for this country.

GENERAL

INDIANS IN THE I. C. S. EXAMINATION

It must be a source of satisfaction to our countrymen to find no less than seven Indian names among the successful candidates at the last Indian Civil Service Examination. The names are:—B. K. Basu, Ram Chandra, Y. A. Godbole, S. S. Nehru, B. R. Rani, G. Rodrigo, S. N. Roy, and K. C. Sen. We congratulate these young men on their success.

A PLEA FOR IDEALISM IN LIFE.

Mr. Wilfred Wellock deplores in the course of an article in the *Modern Review* for September the materialism of the present age and its lack of ideals. Mr. Wellock makes an eloquent plea for idealism in life. He observes:—

Nothing can save the present age from the materialism and the social strife which are at present disintegrating it but a through investigation into the meaning of life, the development of a new and a finer ideal. The ideals of the past have broken down: they have finished their work. Hence a new one is being called for. Christianity is not dead, notwithstanding that many interpretations of it are. Puritanism has ceased to be spiritually productive; it presupposes a social order that the more advanced people of this age cannot longer tolerate.

Referring to the gap which has to be filled up, Mr. Wellock says:—

If I were asked what that element is I should say it is the conception that fellowship is life, that in relationship with our fellows we can have real spiritual life. Until we realise that man is a spiritual being, worthy of our love, devotion and service we shall not as a people cease to treat our fellow men cruelly and inhumanly as we do to day by our commercial practices. Thus, this question of an adequate spiritual ideal for the guidance and development of our democracy is, we believe, the most vital question of the hour. And

surely the puritan conception of life, with its abstract spiritual ideal, its tendency to ignore social claims to undervalue social relationships, is surely not the last word in the development of Christian thought! It were arrant fatalism to deny that there are heights and depths of spiritual attainment beyond that! Happily a new social idealism is slowly coming upon the horizon of our life; in that idealism is the great hope of the twentieth century, the hope of England, and, may we not also say of every nation on the face of the earth that it is desiring liberty, opportunity to grow and to live as men.

THE SUICIDAL MANIA

The *Indian Mirror* writes:—The increase of the suicidal mania is one of the greatest social problems of the day. The Report on Sanitation in Bengal shows that the number of suicides in these provinces during 1911 was 2,897 against 2,857 in the previous year. The number of female suicides was nearly double that of male suicides, viz., 1,899 against 998. The largest number of the misadventures was as usual reported from Cuttack, viz., 401 against 427, while 24 Pargannas, Jessore and Nadia, continue to occupy the next three places with their positions slightly changed, the deaths in them amounting to 261 against 242, 238 against 260, and 222 against 237, respectively. The smallest number of suicides was reported from Durbhunga viz., 7, Darjeeling and Bhagalpur coming next with 13 deaths each. The preponderance of suicides among females will perhaps be found on investigation to be due to some of our social evils, that of early marriage being the most conspicuous among them.

INDIAN LOYALTY.

Some of the cooly folks of Calcutta have made a god of the place where last year was the Royal Pavilion which sheltered the King and Queen. A small grey stone with a few withered hibiscus flowers about it may be seen saluted by the passing crowd at all times of the day.

THE DEPRESSED CLASSES.

A recent number of *The Christian Endeavour* gives the following interesting review of our publication, "The Depressed Classes" from the pen of the late Dr. Arthur H. Ewing:—

The sub-title of this recent book, published by G. A. Natesan & Co, Madras, is "An Inquiry into Their Condition and suggestions for Their Uplift."

The book is made up of twenty three articles by well known Indians, with a few Europeans. In the former list the best known names are H. H. the Gaekwar of Baroda, the Hon. Mr. Gokhale, the Hon. Mr. Justice N. G. Chandavarkar, and Lala Lajpat Rai. Most of the remaining names also indicate men of a very wide, if not in every case, of an All-India representation. The European list contains four names—the Right Rev. the Lord Bishop of Madras, Mr. Valentine Chirol, the Rev. C. F. Andrews and Mrs. Besant.

Most of the articles are re-publications from *The Indian Review*, where they first appeared. Those who wrote later had the benefit of what had been previously published. The book is, therefore, of the nature of a "progressive symposium" on the subject. The good round sum of 50,000,000 figures largely in the book, this being approximately the number of the "Untouchables," whose present condition and future welfare, for a variety of reasons, stir the hearts and quicken the mental activities of those who have contributed to the series.

Though many minds have uttered their thoughts on the problem, and though shades of opinion and angles of vision are as diverse as the writers are various, still certain outstanding features characterize the contributions as a whole.

1. There is profound recognition of the fact that, in the treatment accorded to these lowly peoples, the past may be fairly described as long "Centuries of dishonour."

2. There is a deep conviction that something must be done, and in some articles a most wel-

come record of what has been accomplished, as for example, in Barar, Bombay and the Punjab.

3. There is a frequent repetition of the thesis that in the treatment accorded to the "Untouchables" Hinduism has been untrue to certain great voices and examples of the past, which pointed to a better way.

4. There is universal recognition of the fact that education must be the chosen means to transform the evil conditions of the time into the better conditions of an anticipated future.

5. There is frequent recognition of the noble work done by Christian Missions for these down trodden ones. Sometimes this recognition is gracefully given with no sign of a different feeling lying behind the words. At other times the other note is clearly manifest. Says the Hon'ble Mr. T. V. Seshagiri Aiyar, on page 86—

"A Christian Convert from Hinduism seldom takes part in our national movements. With rare exceptions he keeps aloof from political organizations. It is, therefore, necessary that we should earnestly and seriously work up this question as statesmen with human instincts."

The significance of the "therefore" (italics, mine) is lacking on the surface, but it is not difficult to imagine what is hidden away. Another writer speaks of the impropriety of recognizing men of this class, when, as Christians, they put on coat and trousers, and refusing to the same sort of men recognition while they remain Hindus.

While these are the outstanding features of the book, there are many points of much interest dealt with by one or more of the contributors, and to some of these we may now turn.

1. A certain number of contributors frankly indicate that the ruling of Mr. Gait, the Census Commissioner, who held that the "Untouchables" are not Hindus, is the focus of their thought, and the special object of their attack. In these new days of Councils, when numbers determine representation, it is not possible to contemplate calmly the removal of 50,000,000

THE VIKRAMA ERA.

BY

RAO BAHADUR C V VAIDYA

THE *Quarterly Journal of the Royal Asiatic Society of Great Britain and Ireland* contains an interesting article by Mr J Kennedy on the era of Kanishka in which he tries to settle the date of Kanishka on the basis of evidence derived from some Chinese writers of about the fifth century A D Mr Kennedy supports the theory already propounded by Dr Fleet and thinks that Kanishka founded the era of 57 B C, which, as he himself observes, is universally ascribed by Hindus to Vikrama of Ujjain Many scholars, on the other hand, notably Mr Vincent Smith, the author of the well known "Early History of India," assign a much later date to Kanishka viz, about 125 A D All Western scholars however agree in thinking that Vikrama the reputed founder of the era of 57 B C, is a myth In an article which appeared in the April number of the *Indian Review* for 1911, I tried to show that this bias of European scholars against a Vikrama in 57 B C, is not well founded and that there must have been a Vikrama of Ujjain in 57 B C, who defeated the Shakas about that time and founded the era which goes by his name I think it would not be improper for me to examine this new contribution to the controversy about the era of 57 B C, and to see how far the theory put forth by me is shaken thereby No doubt Mr Kennedy does not refer to my views on the subject—probably he is not aware of them I shall however try to confine myself to

an examination of his view referring to my previous arguments only in the briefest possible manner and adding new ones which suggest themselves to me at this stage.

Mr Kennedy after detailing the evidence he adduces from the Chinese writer above mentioned thus concludes his article "Most eras of long standing are either astronomical or religious in their inception * * * Now the era started by Kanishka is not only a regnal but a religious one It marks the date of Kanishka's conversion to Buddhism, and the convocation of the council—two events which followed the one immediately upon the other * * * Now it is evident that he (Kanishka) must have conquered Jambudvīpa before he convoked the council, and that as a foreigner and a *mlechha* his rule was illegitimate It was the convocation and the patronage of the council which made him and his line legitimate He naturally dated his regnal years from it On the other hand the Buddhists would continue to use the era, once it was started, without reference to the reigning monarch. Hence its wide diffusion, its perpetuation and its namelessness But these are precisely the characteristics of the numerous inscriptions of early date which are ascribed to this era In the Takhta Bahai inscription, it is merely called the 'continuous' era It was never connected in the popular mind even at that early period with any particular king It was at once nameless and general Although started by a King it was strictly speaking not a regnal but a religious era, the era of the Buddhists And thus by the irony of fate the Hindus preserve the memory and celebrate the birth of an heretical and hostile faith" (P 688)

Now if we carefully examine each statement of fact or inference in this argument we shall find that it is either incorrect or unsound or else but partially correct or sound. Let us take the statements one by one and see how far each one is well founded or otherwise.

Mr. Kennedy observes first that most eras of long standing are either astronomical or religious in their inception. Now this is only a partially correct statement. In fact no era has been in its inception astronomical except perhaps the problematical Kali Yuga era of the Hindus. Eras have usually been regnal in their inauguration, and there are some notable eras of long standing which were in their beginning purely religious. But there are some eras of long standing which were neither regnal nor religious in their inception, but national. For instance the Roman era was a national era and was founded not when Rome was founded but subsequently under the influence of a national sentiment and from a point of time of national importance viz., the fabulous founding of Rome by Romulus. The Greek era was similarly a national era counted from the holding of the first Olympian Games, founded not then, but subsequently. Both these eras were long lived, especially the former. The Roman era continued to be used for several centuries of the Christian era and in spite of the fact that the Roman population had adopted the Christian faith. It was only after the complete destruction of the Roman national sentiment after the disruption of the Roman Empire that the Christian era was founded and began to be used by the different peoples which sprang from the disrupted Empire. Similar was the case with the Grecian era. Now, this point I notice specially for the purpose of showing that the Vikrama era might have come into general use and favour owing to a national sentiment in its favour, though there was neither astronomical nor religious consideration to perpetuate its use. If it be once admitted that Vikrama was the first native sovereign

of India who conquered the Shakas, the foreigners and *mlechhas* and was the supreme Lord of the whole of northern India, his era owing to a national sentiment might survive long after he and his line were gone, among the inhabitants of India of all religions. That this was the actual case we shall show subsequently, but it will appear from the above that the fundamental statement on which Mr. Kennedy bases his theory is not correct and that an era in order to be of long duration need not necessarily have an astronomical or religious beginning.

The next premise in Mr. Kennedy's argument is equally unsound. We do not know anything as to when Kanishka conquered India or when he held the Buddhist religious council he is believed to have convened. Whether these facts occurred in the same year or different years, one before the other or after the other, there is nothing to show. But granting that he held the council after he subjugated India we cannot accept Mr. Kennedy's inference that Kanishka naturally dated his regnal years from the holding of the council. For this is not natural, in our view at least. A conquering hero who subjugates a vast country like India would not date his regnal years from a religious council but from his assumption of the imperial rule which might be commemorated by a special regnal occasion or simply from his last great victory. Conquerors of countries are far more impressed by the political aspect of their greatness, than by any religious function they might hold or assist. And if Kanishka was really so engrossed by his religious enthusiasm for Buddhism as to wholly forget his imperial instincts, he would found an era which was wholly religious in its inception. It would be called the era of the council of Parushapura or the council of the Mahayana school of Buddhism or by some other religious name. Moreover the holding of the council of Mahayana Buddhism would not legalise or Aryanise Kanishka's rule in the eyes of

orthodox Hindus who were not Buddhists. And their number was legion. Buddhism even in its palmy days did not supplant Hinduism; at its best period the population in India was only half converted to Buddhism. How then can we explain the continuance of the era after Kanishka's race was gone? We may go with Mr. Kennedy when he observes that "the Buddhists would continue to use the era once it was started without reference to the reigning Monarch." But when he observes immediately thereafter "*Hence its wide diffusion, its perpetuity and its namelessness,*" (which we shall presently discuss), we are disposed to cry "Halt!" Does he mean to say that Buddhists formed the whole of the people of India? At no time did the Buddhists form even the majority of the people, nor were the princes in India Buddhists by majority at any period. It is not therefore valid to argue that because Buddhists would use an era therefore it would become general and thus be perpetuated.

But even here there is a doubt about the fact itself on which this inference is based. Is it true that the Buddhists generally used the era of 57 B.C. for their writings, documents and inscriptions? So far as my impression goes, it is the orthodox Hindus and the Jains who favoured the era of 57 B. C. The Buddhists used probably the Nirvana era more than they used the era of 57 B. C. The Jains had also an era of their own original founder of faith viz. the era of Vardhamana Mahavira, but they used the Vikrama era from a very early time along with the other era almost always in their writings and documents. As a matter of fact the Jains very early made this national hero Vikrama a Jain and thus their religious scruples were satisfied. The Jains were haters of orthodox Hinduism as well as of Buddhism and they would not have taken up this era as they must have known that it was used by Buddhists on religious grounds peculiar to them. It seems to me, therefore, doubtful if the Buddhists

as a matter of fact or inference used this era to any special extent.

We now pass on to the next chain in the argument of Mr. Kennedy who goes on to observe: "But these are precisely the characteristics of the numerous inscriptions of early date which are ascribed to this era." By these characteristics, we apprehend, is meant "wide diffusion and namelessness." Now this is exactly the place where the shoe chiefly pinches in the argument of Mr. Kennedy. The early inscriptions which are dated in this era are apparently widely diffused from the extreme north-west of India to Magadha in the east. The Takhta Bahai inscription in the extreme north-west is now generally admitted to be dated in this era, an inference necessitated by the newly discovered legend of the mission of the Apostle St. Thomas to Gondophares, King of India. But though the wide diffusion of the inscriptions is very probable the other half of the statement is not correct. The era is not *nameless* as Mr. Kennedy seems to think. It is the name of the era in the early inscriptions which in my view makes it improbable that Kanishka could have been the founder of the era of 57 B. C. The era is not *nameless* in the early inscriptions as Mr. Kennedy seems to believe. It is spoken of usually as the Malava Vikrama Era and European scholars often use this name, as curiously enough appears from this very number of the Journal wherein Mr. Veins refers to this era as the Malava-Vikrama Era in a note written by him on Ashvagoshā. That name is evidently significant of the fact that the era was known in the early inscriptions as the Malava era, and in the later inscriptions as the Vikrama era. Dr. Kielhorn who first propounded the theory that Vikrama was a myth (a theory which has unfortunately biased the views of later scholars), in his well-known paper on the subject in the *Indian Antiquary* (Vol. XX), gave a general list of inscriptions known (up to his time) to be in the Vikrama era and found that in the first

inscription there was no name to the era, further on the name used was Malava era and later still the name was Vikrama era. We will specially mention here the first four inscriptions which are antecedent to Houen Tsiang, their dates are Vikrama era 428, 484, 493, and 589 or A. D. 371, 427, 436 and 532. In the first two inscriptions no name is given while in the last two the name given is Malava *मलवसिद्धि* (reckoning or people's). Now it is natural that in the beginning no name may be used, not because people do not know who founded the era, but because the fact is so well known and patent to all. Mr. Kennedy observes here "In the Takhta Bahai inscription it is called the 'continuous' era. It was never connected in the popular mind even at that early period with any particular king. Now if there is any statement in Mr. Kennedy's argument which might startle one as strange, it is this. The Takhta-Bahai inscription is dated 103 and is now pinned to the Vikrama era or rather the era of 57 B.C. by the discovery of the legend of the visit of St. Thomas to India. Now that people should have forgotten in 103 of an era who founded that era, seems to me perfectly unbelievable. The fact must be exactly the reverse. People would not mention the name of the era because the fact of how it came into existence was so well known. We shall cite an instance. Shivaji founded on the occasion of his coronation an era which is mentioned as the Rajyashobana era in Marathi documents subsequent to that event. Now the word Rajyashobana means only coronation, and the words Rajyashobana era mean the coronation era. Whose coronation it is, is never mentioned or mentioned but rarely. These documents which are now being examined would leave any person not acquainted with the fact, wondering as to whose coronation it was meant to convey. The writers forget to mention it not because they do not know whose coronation it is, but exactly because they know it too well and think it unnecessary to

mention it. Similar is the case with the inscriptions dated in Kanishka's and his successors' time. The figures given are Rajyashobana years as has now been found [See *Journal* (1909) of *R. A. S. Great Britain and Ireland*]. The figures were a riddle for a long time and this was so not because the people who recorded these inscriptions did not know to what the figures referred but because they thought it was so obvious. In short the absence of a name in the beginning can never be attributed to people's forgetting to what event the era owed its origin.

There is another consideration which may be noted in this connection. When there are two competing eras, it would be natural to expect that people mentioning a figure would give the name of the era to which the figure referred. It was in this way we believe that gradually a name began to be given to the era of 57 B.C. Even the Takhta-Bahai inscription uses the word "continuous" to distinguish the era from the ordinarily used measure of time which, as we well know was then the number of years elapsed from the beginning of the reign of the reigning monarch. In ancient times, there were no eras and the general custom was to mention the name of the reigning monarch and the year of his reign. This practice was common almost all over the ancient countries of Asia. Now the word "continuous" would signify a special general era which was continuously to be counted on, and not to be changed at the death of each monarch. Such an era was the era of 57 B.C. and there was no competing era of the same kind for some centuries in India, until the Gupta Era came into general use. For some centuries, therefore, the era of 57 B. C. would not be named in documents. When the Gupta era became prevalent it was found necessary to mention the name of the era of 57 B. C. and the name given to it was the Malava reckoning. It seems therefore not at all surprising that the first two documents noted by Dr. Kielhorn do not mention any name

while the next two dated A. D. 436 and 532 mention the name of the Malava era.

But whatever may be the real cause (and many can be imagined) of the omission of a name in the earliest records we have, it would be conceded by everybody that this omission was not due to any want of knowledge as to what event the era referred to. To me it seems almost absurd to argue that in the very first or second century of the era people who used it did not know or had forgotten to what event the era related. The people knew it, but did not mention it for various imaginable reasons. When the name was given it was given as the Malava era and that name is of the highest importance in the present controversy. Strangely enough European scholars ignore this point altogether or pass it by carelessly. Dr. Kielhorn even in the paper above-mentioned, after stating that the name given to the era was Malava, (मलवसंवत्सर) merely remarks:—"What special circumstances may have given rise to its establishment (of the name) I am unable to determine at present." Dr. Hoernle who wrote a paper in the *J.E.A.S.* on the Mandsore inscription of Yashodharman Vishnuvardhana (the 4th inscription above-mentioned) and formulated the theory that this Yashodharman first assumed the title of Vikramaditya and changed the Malava era into Vikrama era passed by the question in the same manner stating that he was not concerned with the question how the era got to be named the Malava era. But this question is of vital importance and cannot thus be shoved off. Its proper significance must be noted and the natural inferences drawn therefrom. Let us see to what this name clearly enough leads us.

We have the name in the 3rd document above-mentioned, dated 436 A.D. or 493V. Now although this is the first document we have, there may have been others of a previous date which we have not yet discovered which give the name here given,

viz., Malava-reckoning. As a matter of fact I have come across an inscription in the very first century of the era which mentions this very name. It is an inscription under a stone *Linga* of great dimensions showing thus that it is a Shaivite inscription. I do not however base my case on this inscription as it has not yet been brought to the notice of scholars and examined by experts. What I would simply urge here is that because our first document is dated 493V, it does not follow that the name was first given then. Keeping that fact in mind let us argue on the basis of this inscription which we have authenticated and which mentions this name in 493V. Now it seems to me that this name indicates without doubt that the era has a reference to some event connected with the Malava people. We have seen and Mr. Kennedy also admits the wide diffusion and perpetration of the era of 57 B.C. It was an era prevalent not only among the Malava people but among most people of Northern India and used by Buddhists and other persons forming a majority of the people. Why should it then be called the Malava-reckoning to the exclusion of all those other people who used it. Clearly enough, the name was not given owing to the era being prevalent in Malava. Nay, as a matter of fact in Malava or Malwa proper it could not have been prevalent then. We know from history Ned Ujjain, the heart of Malwa, was in the hands of the Shakas from 78 A.D., at least certainly so from 125 A.D., to 400 A.D., when the last Shaka King was killed by the Gupta King Chandragupta II. Probably therefore in Malwa from the second century to the fifth the Shaka era was prevalent and thereafter perhaps the Gupta Era. So the facts show that the Malava era was prevalent over many countries except Malwa proper and therefore the name Malava does not refer to the prevalence of the reckoning, but to the cause of it. We have thus strong ground to hold that the era was believed in the fifth century A.D., to have been started by the Malava people. Now that people have nothing to show between 78 and 400 A.D. If they started an era which was not confined to them but which became general it must relate to an event of general importance and admiration and we are thus inevitably led to the admission of a Vikramaditya or some conquering hero belonging to the Malava people who led his arms to the extreme Northwest Frontier in 57 B.C. It may perhaps be suggested that in 500 years people had forgotten all about the real founder of the era and his capital and had substituted a fictitious Vikrama

Character.

BY

REV. R. A. HUME, M.A., D.D.

WHEN are coming to know that the physical eyes of the majority of human beings have more or less imperfections. A common defect of eyesight is inability to see things in focus, that is, to see all parts in the right perspective. And the greatest difficulty in supplying spectacles is the difficulty of so adjusting them to the eyes as to give the right focus. But if things are not seen in true focus, they are not seen as they rightly are. Similarly thoughtful persons know that the mental eyes of most men are quite imperfect. The common defect of mental eyesight is inability to see things in focus. For this reason men do not see principles, tendencies and facts as they really are. This common mental myopia, i. e. shortsightedness, makes those things which are near appear inordinately large.

Unquestionably the most important good for every one, both for his own advantage and for his usefulness to others, is the possession of noble character. Yet hardly one in a hundred would say this. The majority of men consider the satisfaction of some bodily desire, or the possession of money, or reputation, or knowledge the supreme good. It might be imagined that the flower of our youth, who are intelligent, well-meaning, and well-behaved, who are pursuing an education in advanced institutions, would not make such a mistake. Yet in the highest educational institutions of every country the most clear-sighted instructors have frequent occasions to remind students that, not the attainment of knowledge, but the development of worthy character, should be the chief aim of all education.

The one conclusive illustration of this truth is that the highest adjectives which can be applied to God are not the adjectives 'all-wise' or 'almighty,'

but the adjectives 'good' and 'holy.' Since the supreme satisfaction of even our all-wise and almighty God is not in His wisdom or power, but in His character, equally must this be so of all His human children.

Again the chief service which any one can render to others is through his chief possession. A mother's main service to her child is through her mother-love which quickens her mother-wit. A doctor's main service to suffering humanity is through his peculiar possession of medical skill. A friend's main service is through his sympathetic appreciation of his friend's need. Though this is so, the quality of the service of mother, doctor, friend is largely determined by their characters. Of two mothers, doctors, or friends of equal intelligence, verily the service of that one is finest who has the noblest character. God's character is not only His chief satisfaction for Himself, but it is His chief means of helping the human race. And on the contrary the greatest injury which a wicked man does is through his contamination to the characters of others caused by contact with him. When a new offender is put in the ordinary jail the injury which he suffers is not from his confinement, but from association with bad people, and from his loss of self-respect.

When the word character is used without any defining adjective, it is ordinarily understood to mean the possession of nobility of nature. This is one strong evidence of the general recognition of the intrinsic importance of character. It is not difficult to say why character is the supreme good. Strictly, character is the man himself. His physical frame, his money, all his possessions are not the man. When he dies what can he, what does he, take with him except his character? Yet is there a single characteristic which he can leave behind. Not one, not one. The character is the man; the man is his character. Some figures of speech may make this clear. Character is the blade of the knife; everything else about him is

the knife's handle. Character is the picture; everything else the picture's frame. Character is a watch's mechanism; everything else the watch's case. Character is the steam which makes the locomotive go; everything else the machinery without which the engine can do nothing.

In a general way we know the chief elements of noble character. Yet probably most men rarely think this over, and rarely specify what these elements are. Also it is difficult to recognize and enumerate them in the best order. However, probably every one would consider truthfulness the most basal of worthy traits. Like all elemental things truthfulness is not easy to define. Its essence is a reverential desire to see, to accept, and to adapt one's self to every thing just as it is. It is an expression of the teachable spirit. It involves a sincere desire to avoid bias in the consideration and representation of every matter. It feels a real aversion for any statement or appearance about one's self or about others which is meant to mislead or to deceive. The more truthful one becomes, the more conscious he is of the easy tendency in thought and feeling; the more pains he takes to avoid yielding to bias, the more he appreciates the satisfaction of being true within and without. There never was an age when truth was so prized, honored or followed as the present. In diplomacy between nations there has been an immense increase in frankness and truth. In religion there is a growing demand for simplicity and reality, and an open revolt against professed allegiance to any opinions or practices simply because they are traditionally deemed correct. But probably the greatest gain in reverence for truth is in scientific circles, because in real science the only acknowledged test is the evidence of experience. Every department of life owes a debt to science for its demand that only that shall be accepted as true which stands the test of the most searching examination. To my mind the chief value of

higher educational institutions is that their general influence is to promote the desire and search for truth. This note of reality as the controlling element of life is probably the main reason for the power of Kipling, the most virile of modern poets. Take as one of his characteristic utterances the following anticipation of the future from his poem *L' Envoi*.

"Then only the Master shall praise us and
only the Master shall blame;
And no one shall work for money, and no one
shall work for fame;
But each for the joy of the working, and each
in his separate star,
Shall draw the Thing as he sees it for the God
of Things as they are"

A second chief element of noble character is devotion to duty. Not more universal nor ceaseless is the law of gravitation in physics than the law of duty in morals. Because every physical atom is in relation to all other atoms, the force of gravitation immutably controls the tendency of each atom to all others. But physical entities are not more certainly or universally bound into mutual relations than are spiritual entities. *Unus homo nullus homo* is a true Latin proverb, meaning, that no one could be human except through being in relation with others. First he is in relation to his immediate family, but through them he is truly in relation to thousands of others; and through those thousands, he is, in the last analysis, in real relation to still larger and larger aggregations, and to the Source of all being. Therefore, being in relation to others, yet unlike physical particles, being an agent capable of choosing to follow a higher or lower relation to those with whom he is bound, the law of moral gravitation, which is another name for duty, as ceaselessly pulls on him, as gravitation pulls on physical atoms. Herein comes the nobility of devotion to duty as an element of character. If he will, man should and can loyally respond to

the call of the highest relations, or he can ignobly resist the call, and so fail in duty.

So near is glory unto dust,

So close is God to man,

When duty whispers low "Thou must"

The youth replies, "I can."

There is one Being in the universe, the Father of us all, who never once has failed to do His very best for every human being, and in so doing He has doubtless considered that he was merely doing His duty. In so doing He has probably never been fully appreciated. But that has made no difference in His course. He has done His duty for the satisfaction which He had in it. It is an element in His perfection of character.

It is a sublime and inspiring truth, though one rarely noted, that we are a part of a universe. But a universe must have and can have only one system of control, one moral order namely the thought and character of the God who is the soul of the universe. Since doing His duty toward every human being is the source of His personal satisfaction, even though this is unknown and unappreciated by almost all for whom He does His best, under the one law of the universe the same principle holds equally good for men. The best thing for ourselves and our best service to fellow-men is that, up to the best of our light and our ability, we should steadfastly and gladly do our duty. Elizabeth Barrett Browning well sung:—

The sweetest lives are those to duty wed

Whose deeds, both great and small,

Are close-knit strands of an unbroken thread

Where love enobles all.

The world may sound no trumpets, ring no bells,

The book of life the shining record tells.

As a third element of noble character I mention two qualities which are so closely allied that they might almost be considered one, though they have two names. They are faith and patience. They are fundamental constituents of character.

Unfortunately the meaning and implication of these transcendent terms are often so emasculated as to rob them of much of their finest significance. Sometimes faith is supposed to mean nothing more than mere assent to intellectual formulæ. When faith is weakened to mean intellectual acceptance of even a religious creed, it has no more spiritual quality than intellectual acceptance of a geometrical proposition. But that noble word has fuller implications. In the highest sense faith is devotion to and trust in persons and ideals. He is a man of faith who has devotion to some person or to some worthy cause. Yet even such faith has inadequate power unless it is associated with the closely allied virtue of patience. Too often patience is thought to mean a mere passive submission which takes evil without resistance, because it is too inert to try for anything better. In its fullest meaning patience is a spiritual endurance of delay in the actual securing of high aims because of loyalty to some persons and assurance of the final victory of high aims. Patience is "readiness to wait God's time because of trust in God's truth." In a good book men are urged to be "followers of them who through faith and patience inherited promises."

The history of the world supplies many examples of men of power who, though men of faith, finally failed, because to faith they did not add patience. History also offers shining examples of men of less native equipment who won final victory because they combined patience with faith. It is not difficult to see why this is so. One sufficient reason is that, however wise a man may be he is not far sighted enough to forecast all the future and to apprehend all unexpected reverses. In the face of sudden failures patience is an indispensable adjunct of faith.

Napoleon is a brilliant example of a man of exceptional endowment, of fortunate circumstances, of abounding faith in himself, and of extreme ability to awaken in others faith in himself, who

yet became a conspicuous failure because he lacked sufficient patience. Therefore, though for fifteen years continuously he had marvellous successes yet in three short years he failed because he lacked that spiritual endurance which knows how to meet temporary reverses.

A conspicuous example of the opposite kind is furnished by a classical illustration from Rome in the Punic wars. It illustrates the greatness of patience because it involved the character of a whole people as well as of a single leader. There was a mortal conflict between Carthage and Rome. Hannibal, the Carthaginian leader, one of the greatest generals of ancient times, had invaded Italy with an immense army. The Roman army was commanded by a far less capable soldier, Fabius. In the battle of Cannae in 216 B. C. Fabius so mismanaged that the greater part of his army was destroyed. His hopeless younger officers proposed that in shame they should fly to some foreign land. But despite his failure and his other limitations, that defeated general possessed the victorious quality of spiritual endurance and of devotion to his country's cause, called patience. He led his handful of men back to Rome. And though most of the members of the Roman Senate were his political opponents, though through his mismanagement their brothers and sons had lost their lives, and the existence of the nation had become endangered, yet that Roman Senate, possessing the national characteristic of spiritual endurance, received him with no reproach, but with thanks, and voted him a triumph, because, as they said, "He had not despaired of the Republic." And through subsequent ages that defeated, but enduring, Roman general has had the honor of having his name attached to a conquering mode of life called "The Fabian policy," i. e., the way of eventual success through calm endurance in working for a high purpose, viz., the way of patience. Perhaps more than any other quality this characteristic of patience in its highest sense,

i. e., of spiritual endurance, is the main source of power in the English national character. It is well described in the following poem by Henry Newbold.

There's a breathless hush in the close to night;
Ten to make the match and win.
A bumping pitch and a blinding light,
An hour to play the last man in.
And it's not for the sake of a ribboned coat,
Or the selfish hope of a season's fame,
But his Captain's hand on his shoulder smote,
"Play up! Play up, and play the game."
The sand of the desert is sodden red—
Red with the wreck of the square that broke;
The Gating's jammed and the colonel's dead,
And the regiment blind with dust and smoke,
The river of death has brimmed his banks,
And England's far, and honour's a name,
But the voice of a school boy rallies the ranks,
"Play up! Play up, and play the game,"
This is the word that year by year,
While in her place the school is set,
Every English boy must hear,
And none that hears it dares forget.
This they all with a joyful mind
Bear through life like a torch aflame,
And falling fling to the host behind,
"Play up! Play up, and play the game."

Time forbids dwelling on many other elements of character, such as humility, unselfishness, purity, separation, love. However, I mention one more, viz. passion for service. Of the manifold excellencies of our heavenly Father one of the most supreme is His passion for service, His ceaseless effort to do something for every human child. This being so, the same passion must be and is essential for noble character in men. The Lord Jesus Christ gave His estimate of its worth by saying, "Whosoever would become great among you shall be your servant; and whosoever would be first among you shall be your bond servant." This being the divine law, how appropriate and inspir-

ing the fact that the royal crest of the most exalted person in the British Empire, our King-Emperor, bears as its motto the words, "Ich dien," *i.e.* I serve.

Much might helpfully be said as to how noble character can be developed. Time permits of only two brief suggestions. Character cannot be achieved by any direct effort to gain it. The first fundamental principle is that only life begets life; and that the closer the contact of life with life, the more empowering the connection. The one sure, quickest way to develop bad character is for any one to be associated with persons of bad nature. At first though the association be not one chosen or approved, yet finally it becomes such. The main exception to this experience is when the association is caused by an earnest desire to reform the evil doer. The reverse is equally true. Noble character is mainly developed by intimacy with persons of worth. The more worthy the person and the more intimate the relation, the more helpful the connection. Every pupil of every beloved instructor will testify that his main obligation to that instructor is not for knowledge received, but for inspiration from character.

A necessary inference from this principle is that, since God is a person who is in actual relation with every human being, and since His character is perfect, intimacy with the living God is the greatest power for the development of character. While this is logically true, it must be the sad testimony of us all that rarely are our spirits truly conscious that God is within us. This developed absence of realization of God's presence is the main cause of low spiritual life. Therefore every one of us needs to do what is called "Practising the presence of God," *i.e.* intentionally and frequently saying to oneself, "God is now in me, earnestly desiring to help me to be noble." Such constant reminder is a most powerful means for a man's gradually becoming noble in character, *i.e.* coming more

and more to think, feel and act as our heavenly Father does. The perfection of the character of the Lord Jesus Christ is illustrated by His ceaseless consciousness of intimacy and harmony with God the Father. Also it is God's wish and practice that our relations with fellow-men should ever remind us of our connection with Him, just as every sense of our connection with Him should inspire us with a feeling of more responsibility towards brother men.

The second fundamental principle for the development of noble character is that by imparting life to others we develop our own life. It is a spiritual law that the highest way of developing one's own life is by imparting it to others. It is blessed to receive life. It is more blessed to give it. Whoever loses his life in service for others finds it. *Saved to serve is the divine law of life. If one ever once thinks of improving his own good by serving others, that very thought will injure his character. But without thinking of the reflex influence on himself whoever unselfishly serves others is thereby certainly ennobled.*

I take this opportunity to drop a token of admiration and gratitude on the memory of that most humble, but most noble, of our fellow-countrymen Behramji M. Malabari, who was foremost in service for all fellow-men in any need, but who rarely let his own right-hand know what his left hand had done. Also I would express high respect for that foremost public man of India today, the Honorable G. K. Gokhale, the founder and leader of the Servants of India Society, who lives to advocate the cause of all who are oppressed.

The greatness of the principle which we are considering is that it works its benign effects not solely on a few prominent leaders of mankind. Equally and absolutely it is beneficent in the lives of every member of the unheralded multitude who are true noblemen through goodness of

ed a man or rather the hero of the play, simply because he had too much reflective temperament in him. Any man who thinks and thinks too much develops a peculiar trait of his own character which ultimately proves fatal. Too much thinking seems to make one unfit for action. What was young Hamlet when his father was occupying the throne of Denmark? He was a diligent student and that too of a branch of study which is so much liked and admired by the Hindus, namely of philosophy and metaphysics. How did this study, probably conducted on wrong lines, influence him? When he grows to manhood he becomes a first-rate philosopher and begins to moralize on every incident however trivial it may be. No moment passes when he does not put on his philosophic garb. His father's ghost appears to him and commands him to murder Claudius his own brother who had murdered him and married his wife Gertrude. An obedient son as the young Hamlet was, he promises to carry out his instructions faithfully but what has the young-philosopher done to redeem his promise? Whatever justification might be given for Hamlet's delay it can be safely asserted that he had signally failed to do his duty. He lets every opportunity slip by and seeks consolation from his philosophy so much so that on certain occasions he himself is baffled in his attempts to analyse the cause of his own inaction. What with the serious doubts crossing his most able mind, what with his so-called justification of his inaction and failure to act promptly and what with his desire to "put on antic disposition" he delays and delays unusually long. A period of torturing suspense drives him into melancholia and leads on to semi-madness. He thought and "thought precisely on the event" and so many innocent lives were lost and who is responsible for that 'diurnal sight' if not the melancholy and highly contemplative nature of Hamlet himself? What is true of a man is equally true of a nation. And the saying,

And thus native hue of resolution,
Is sicklied over with the pale cast of thought,
And enterprises of great pith and moment
With this regard their currents turn away
And lose the name of action.

(*Ham. III. 1.*)

has a special moral significance of its own especially for a 'nation' which ever and anon 'plunges in deep thought.' Thought there must be, but too much of it seems to suck the life-blood of a nation at a time when action and not talk should have a free play. The "ghosts" of reformers like Raja Ram Mohan Roy and Swami Dayananda denying to themselves the pleasures of "Mookti" in an undiscovered region from the bourn of which for a time no traveller returns, come and cry for speedy action in matters of social reform and many like the young Hamlet respond saying

"Thy commandment all alone shall live
Within the book and volume of my brain
Unmixed with baser matter: yes, by heaven!"

(*Ham. I. 5.*)

But a "no" by action, at least, in the majority of cases. We pause, pass resolutions, think and deliver thundering speeches, calculate, but do (?).. Philosophy of quietism must find a secondary place in the evolution of society and the nobler philosophy of action should take its place. Of course, some 'whips and scorns of time' which made Hamlet's life so unbearable to him are in a great measure responsible for driving many an earnest but poor soul to despair and create in them a disgust for the world and its affairs.

'The oppressor's wrong, the proud man's contumely
The pangs of despised love, the law's delay
The insolence of office and the spurns
That patient men of the unworthy take."

Fortunate indeed is the man who has not felt all these whips! But in this topsy-turvy world of ours every religious reformer and every earnest truth seeking soul has felt one or all these pangs but the glory of such men consisted in marching victoriously over all these and ultimately in conquering even death. Far different is the case with ordinary mortals. To them, how discouraging are these:—(1) The oppressor's wrong

(2) The proud man's contumely (3) The insolence of office!

Polonius, another interesting character in "Hamlet" talks wisely but acts foolishly. There is a world of difference between his precepts and his own example. He is a bundle of inconsistencies. With all that, he gains worldly success. Every monarch seems to like him and his ways. In addition to his being a garrulous old man and a cunning courtier he is a weather cock and a clever time server. He, like many worldly wise men falls in the good looks of the ruling monarch but with all his noble precepts

"See thou character! Give thy thoughts no tongue,
Nor any unproportioned thought his act,
Be thou familiar but by no mean vulgar.

Give every man thy ear but few thy voice,
Take each man's censur but reserve thy judgment.

Neither a borrower nor a lender be,
For loan oft loseth both itself and friend,
And borrowing dulls the edge of husbandry."

he never seems to have known or realised the significance of the famous saying "*Rāja nīte Anēka Rupa*" and that too much of flattery of any one and an officious and impertinent nature lead to a disastrous down fall. The "tedious old fool" was of superficial worldly experience but any how his fate gives a warning to many, that mean flattery to gain selfish ends or the setting off the one individual or a community against the other—mark how ingeniously he made Ophelia dis-regard Hamlet, her lover and an idol of her heart—is ultimately ruinous to such time-servers. This fact is emphasized by the fate of two other courtiers "Rosencrantz and Guildenstern" as well. Polonius asked his son

"To thine own self be true,
And it must follow as the night the day,
Thou canst not then be false to any man,"

but he himself never acted up to these words and many of our readers who have had occasion to come across many "Poloniuses" will not fail to realise that in 'the rotten state of the then

Denmark' too he met with a just punishment for his insincerity.

The punishment that is meted out to a moral wrong doer like Claudius in the shape of the prickings of his own conscience; the reward that is obtained by one who leads a highly moral life; the peace of mind which is the outcome of equanimity so marked in Horatio—'one sterling thing in the rotten state of Denmark'—; the miseries that fall to the lot of a man who is entirely guided by 'a timid, sensuous and sentimental' woman of the type of Gertrude; the ship-wreck of life, so natural to a weak, fragile being like Ophelia; and above all the victory that crowns the efforts of a genuine hero like Fortinbras are admirably shown in this great play of *Hamlet*.

There is no doubt that a religious element is very strong in *Hamlet*. In spite of the ghost and other ghastly incidents Shakespeare's mind seems to have been upset with the great problems of life and death. In the first Soliloquy of Hamlet (Act I Sc 2) the poet refers to "the cannon against self-slaughter" and says that the Everlasting has "fixed that cannon." It is easy to perceive that he rightly considered suicide as a heinous crime. Hamlet in another Soliloquy (Act III Sc 1) refers to "death" as a "sleep" and to "that dread of something after death, the undiscovered country from whose bourn no traveller returns." He believes that after death the human soul is not annihilated but only enjoys a kind of "sleep" in an unknown region. He is neither a believer in the "re-birth theory" nor is there anything to show his belief in the eternity of human soul. Whether the human soul existed before this birth or not he does not explicitly say. It is therefore safe to conclude that he like many other Christians believed that human soul is created, and that it has a beginning but no end. Unlike Shakespeare, William Wordsworth believes in the eternity of the human soul as well as in its previous existence. He unlike Shakespeare,

considers birth as "a sleep and a forgetting." He further believes that

"The soul that rises with us, our life's star
Hath had elsewhere its setting,
And cometh from afar;
Not in entire forgetfulness,
And not in utter nakedness,
But trailing clouds of glory do we come
From God, who is our home."

The difference between the views expressed by these two is striking. While Shakespeare considers "To die is to sleep" Wordsworth holds that "Birth is but a sleep and a forgetting," and he leans towards the belief of the Hindus in the theory of "Transmigration of human souls."

Shakespeare has implicit faith in the efficacy of Prayer. Says he

"And what's in prayer but this two-fold force,
To be forestalled ere we come to fall,
Or pardoned being down? .."

(*Hamlet III. Sc. III.*)

Prayers should be sincere and must be accompanied by a true sense of repentance is his firm belief.

"Repentance—what can it not?
Yet what can it when one cannot repent?"

(*Hamlet Sc. III, Act III.*)

Claudius, the king of Denmark, with all his defects moral or mental, could not have expressed a better sentiment than the following one.

"Words without thoughts never to heaven go."

Sincere prayers offered in the heat of spirits and uttered by a repenting heart alone are likely to find a response and a hearing from on-high, is what the prince of poets believes. Hypocrisy he seems to detest. When a man commits a sin or deprives another of wealth or property of any kind he is not likely to be pardoned in spite of his prayers. Says the poet very forcibly:—

"Offence's guided hand may shove by justice,
And oft it's seen the wicked prize itself
Buys out the law; but it is not so above.
There is no shuffling, there the action lies
In his true nature and we ourselves compelled,
Even to the teeth and forehead of our faults,
To give in Evidence. . ."

(*Hamlet III. Sc. 3.*)

What a world of difference there is between human and divine justice!

Shakespeare is undoubtedly a theist of theists and a firm believer in the control that God exercises on human destiny.

There is a divinity that shapes our ends,
Rough-hew them how we will—

Whether man can possibly be the architect of his own fortune or not and whether it is in the power of man to command success, Shakespeare seems to hold that ultimately there is a Great Divine will that controls man's actions and guides his destinies. "We may not command success but we may deserve it." A theist of Shakespeare's type cannot but hold such views though rationalists might find it hard to reconcile their thoughts with the postulates formulated by Shakespeare in his great play of *Hamlet* which though "a tragedy of thought" has much in it to make our lives not tragedies but comedies.

TWO BOOKS ON BUDDHISM.*

BY

MR. K. S. RAMABAMI SASTRI, B.A., B.L.

THESE two books state in a compendious form what the essentials of Buddha's great religion are. Dharmapala has long been known to us as an enthusiastic Buddhist and has laboured long and strenuously in the cause of Buddhism. Dudley Wright has discussed the essentials of the faith in a very sympathetic spirit.

We must take exception to a statement made in Dharmapala's book about the persecutions that drove Buddhism out of India. This statement is often taken from ill-informed and unsympathetic books on Indian History written by persons who

* "A Manual of Buddhism" By Dudley Wright.

† "The Life and Teachings of Buddha." By the Angarika Dharmapala, Published by G. A. Natesan & Co., Madras Price. Rs. 12.

have not made an accurate study of ancient records Buddhism failed to strike a firm root in India because in spite of the great beauty of its ethical system, it was essentially Godless and failed to satisfy the highest spiritual cravings of the human soul. There is a law of competition and survival of the fittest and the sweetest in the realm of ideas as there is a law of competition and survival of the fittest in the material world, and the doctrines of Buddhism had to retreat before the doctrines of *Sachchidananda*, and *Karma*, *Bhakti*, and *Jnana*.

Another statement made by Dharmapala is equally untenable and opposed to fact. He says that the author of the Bhagawad Gita was hostile to the Vedas and relies on Chapter II verse 46 as supporting his view. Anyone who has studied Sankara's famous Bhashya on the Gita can see how entirely Dharmapala has misunderstood the passage. Further, a glance at the last verse of chapter XVI of the Gita shows beyond all possibility of doubt how Krishna teaches that the revealed scripture is the only and final source of true knowledge.

Another fallacious statement contained in Dharmapala's book is that in Ancient Indian philosophy the highest form of religion consisted in mortifying the body. "This allegation is as astonishing as it is untrue. The Indian sages taught that self control and self denial are the basis on which the temple of devotion and God-realisation can be built, but they always knew and taught that the highest thing in life is the attainment of God love and God realisation through the disciplining of the mind by unselfish action, *tapas*, and *yoga* (mental control).

Thus though the psychology and the religious element in Buddhism are of a poor type, there is no doubt about its ethical beauty or about the supreme fascination and charm of Buddha's personality. Buddha's analysis of the cosmos and of the mind was perfect so far as it

went, though it had some deficiencies as stated already. His ethical ideal is perhaps the highest that has shone upon the heart of men, and no personality in the world can be said to have in a higher measure love for humanity and renunciation. His doctrines of the eightfold path, of the seven jewels of the Law and of the vanquishing of the ten evils are of great beauty and enduring value and make for the evolution of a higher type of humanity in the world.

The two above said books enable us to understand and appreciate Buddhism and will well repay perusal. We can confidently recommend them to the public as enabling us to realise the best elements of a faith whose "goal is to find a refuge for man from the miseries of the world in the safe haven of an intellectual and ethical life through self conquest and self culture."

The Life & Teachings of Buddha

BY

THE ANAGARIKA DHARMAPALA.

This is a clear and concise account of the Life and Teachings of Lord Buddha written by a well-known Buddhist authority and in a style specially intended for non-Buddhists. The book is bound to be widely circulated and appreciated. With an appendix.

Contents.—Introductory, Birth of the Future Buddha, The Boyhood of the Future Buddha, The Initiation of the Bodhisat, The great Renunciation, The Ascetic Life, The characteristics of the Buddha, The Philosophy of the Buddha, Skandas, The Gospel of Destruction, The essentials of the Religion, The decline of the Buddhism, The Ethics of Righteousness, The Brahmachari Life, Analysis, The four stages of Holiness, Appendix Buddha's Renunciation. (Extracts from "The Life of Buddha" by Avagadha Bodhisatva.)

TANAH SHAH (1672—1687).

BY

MR. A. VENKATARAMIAH, B.A., L.T.

ALMOST every Hindu, at least in the Madras Presidency, knows well enough the story of Ram Das and Tanah Shah. Some have read the story, some have witnessed a Hari Katha (kalakshepam) of 'Ram Das Charitram,' while others have seen it put on boards. The events detailed in the story are historical facts and there are sufficient data to strengthen one's conviction. The story is briefly this: Rama Das was a great Bhakta of Sree Rama. He lived in the seventeenth century of the Christian Era. He held the position of a Taluqdar (a Tahsildar—a revenue officer) under Tanah Shah the last of the Kutub Shahi kings of Golkonda. In his zeal and devotion to Sree Rama, he erected a temple at Bhadrachellam and dedicated it to Rama Bhadra or Rama Chandra. But he spent the money of the state for the construction of the temple, and so he was not able to send the amount collected as revenue to the state treasury in time. On investigation, Tanah Shah found out how the money was utilized by the revenue officer, and gave orders, according to the prevailing custom, to exercise "*Zulum*," i.e., torture the offender. Ram Das was sentenced to imprisonment attended with severe torture. Accordingly, he led a miserable life of twelve years' imprisonment. At last Sree Rama is alleged to have gone to Tanah Shah accompanied by his devoted brother Lakshmana, and to have paid the amount in full satisfaction of the debt. The interview of Sree Rama with the Badshah is a very interesting scene. The story says that Tanah Shah gave a receipt for the amount received by him. This receipt was left near Ram Das and the two brothers disappeared. The next day Tanah Shah was struck with won-

der and at once released Ram Das and became his ardent admirer.

To this day, H. H. The Nizam of Hyderabad sends the customary presents to the temple at Bhadrachellam. So much for the story in outline.

Who was this Tanah Shah, at first the oppressor and later the admirer of Ram Das? Tanah Shah was the last of the Kutub Shahi kings of Golkonda. His other name was Abul Hassan. He reigned for fifteen years (1672-1687). He was the nephew of Abdulla Kuli whose daughter he married.

GENEALOGICAL TABLE CONNECTING TANAH SHAH WITH THE OTHER KUTUB SHAHI KINGS OF GOLKONDA.

* Hyderabad, the present capital of H. H. the Nizam, was named after this man.

Tanah Shah (Abul Hassan) was a man of indolent habits and passed most of his time in the pursuit of pleasure, leaving the control and management of the state to his able Hindu ministers Akkanna and Madanna.

In the seventeenth century Bijapur and Golkonda were towers of strength for the Moslem power, in Southern India. The Marathas were also a rising power at this time. Well might Aurangzeb have used these two States to keep

in check the Hindu power; but he invaded the Dekkan and first directed his attention to the conquest of Bijapur, the fulfilment of which he entrusted to his son Prince Mahomed Azam. As the entire subjugation was an undertaking requiring some time, he himself removed from Aurangabad to Ahmadnagar and thence to Sholapur, where he pitched his camp. Tanah Shah wrote a letter to his envoy with the Emperor's army, in which he professed his loyalty and devotion to the emperor, but that since the Emperor had laid siege to Bijapur, Sambhajī would proceed to the assistance of Bijapur with a large contingent and that Tanah Shah himself would despatch a force to oppose the invaders. This letter fell into the hands of Aurangzeb. The Emperor was very angry when he saw the language of the letter. He is said to have postponed punishing Tanah Shah, whom he contemptuously designated the "Poultry seller," the "Monkey trainer" and the "Tiger exhibitor," for his misconduct so long, "but as the cock had taken to crowing so long, no time was to be lost in wringing his neck." He despatched Shah Alam and Khan Jahan at the head of a considerable force to bring Tanah Shah to his senses.

Several engagements were fought in which the Kutab Shah's forces were victorious, and they would have driven out Aurangzeb's forces, but for the treachery of Tanah Shah's general, who temporised with the enemy until the arrival of reinforcements. The Golkonda troops then fell back upon the capital. The king tried to make his general prisoner, but he escaped and joined the Imperial army.

The subjugation of Bijapur was followed by that of Golkonda. Aurangzeb, himself went to Golkonda. Tanah Shah felt that the time of his fall was near and wrote a letter to Aurangzeb renewing his protestations of obedience, and reiterating his claims to forgiveness. Aurangzeb wrote a reply to the following effect: "The evil

deeds of this wicked man pass beyond the bounds of writing; but by mentioning one out of a hundred, and a little cut of much, some conception of them may be formed: (1) placing the reins of authority and government in the hands of vile tyrannical infidels; (2) oppressing and afflicting the Sayyids, Shaikhs and other holy men, (3) openly giving himself up to excessive debauchery and depravity; (4) indulging in drunkenness and wickedness night and day, (5) making no distinction between infidelity and Islam, tyranny and justice, depravity and devotion; (6) obstinate wars in defence of infidels, (7) want of obedience to the Divine commands and prohibitions, especially to that command which forbids assistance to an enemy's country, the disregarding of which had cast a censure upon the Holy Book in the sight both of God and man. It had lately become known that a lakh of pagodas had been sent to the wicked Sambhajī; that in his insolence and intoxication and worthlessness, no regard had been paid to the infancy of his deeds, no hope shown of deliverance in this world or in the next."

In 1687 Aurangzeb himself led an army and besieged Golkonda. The siege was protracted for a long time. Of all the nobles of Tanah Shah, the one who never forsook him until the fall of Golkonda, and who throughout exerted himself in an inconceivable manner, was Mustafa Khan Lari, or Abdur Razzak, as he was also called. Many of Tanah Shah's commanders deserted him and joined the Imperial army, when Aurangzeb granted to them suitable mansabs and titles. During the siege, a few brave men of Aurangzeb secretly and suddenly at night ascended the ramparts, but the barking of a dog gave the alarm, and the defenders rushed to the walls and soon dislodged those who had gained the top. They also threw down the ladder, and so made an end of those who were mounting. Tanah Shah gave

the dog a gold collar and a plated chain and directed that the dog should be kept chained near to himself.

The siege lasted eight months, and Tanah Shah's men still worked indefatigably. Aurangzeb frequently communicated with the devoted Abdur-Razzak Lari, and promised him a mansab of 6,000, with 6,000 horse and other royal favours; but "that ungracious faithful fellow," taking no heed of his own interest and life, in the most insolent manner exhibited the Emperor's letter to the men in his bastion, and tore it to pieces in their presence. But the besiegers continued to show great resolution in pushing on the siege. Several times the valour of the assailants carried them to the top of the walls, but the watchfulness of the besieged frustrated their efforts. At length, the fortune of Alamgir prevailed. After a siege of eight months and ten days Golkonda fell into the hands, *not by force of sword and spear, but by good fortune. It fell by treachery.* In 1687, by the efforts of Rahulla Khan, a negotiation was concluded through Rammast Khan Afghan Pani, with Abdulla Khan, who was one of the confidential advisers of Tanah Shah and had charge of the gate called Khirki. In the last watch of the night, Rahulla Khan, at a sign from Abdullah, entered the fortress by means of ladders. Prince Mahomed Azam (Son of Aurangzeb) mounted an elephant, had a large force ready to enter by the gate. Those who had got in went to the gate, posted their men, opened the gate, and raised the cry of victory. The shouts and cries made Tanah Shah aware that all was over. He went into his haram to comfort his women and to take leave of them. With remarkable self-control, he went to his reception room and took his seat upon the *masnad* and watched for the coming of his "unbidden guests". When the time for taking his meal arrived he ordered the food to be served up. As Rahulla Khan and others arrived he saluted them all, and never for

a moment lost his dignity. He received them with courtesy and spoke to them with warmth and elegance. Tanah Shah called for his horse and accompanied the Amirs, carrying a great wealth of pearls upon his neck. When he was introduced into the presence of Prince Mahomed Azam Shah, he took off his necklace of pearls and presented it to the prince in a most graceful way. The Prince took it, and placing his hand upon his back, he did what he could to console and encourage him. He then conducted him to the presence of Aurangzeb, who also received him very courteously.

The property of Tanah Shah which fell into Aurangzeb's hands after the capture of Golkonda included 8,51,000 Huns (a hun=8 shillings), 2,00,50,000 rupees, besides jewellery, ornaments and plates of much value.

Having settled the country about Hyderabad and having placed the garrison of Golkonda under the Governor of Hyderabad, Aurangzeb went to Bidar at the close of 1687. Thence he proceeded to Zafarabad, where "he parted company with Tanah Shah," who was sent for confinement in the fort of Daulatabad. Stringent orders were given, however, that the king should be honourably treated, literally supplied with food and clothing. At the request of Tanah Shah, Aurangzeb gave orders that he should also be supplied with best *perfumes*. Even when he was a ruler at Golkonda, he always lived in a "perfumed atmosphere." He planted a Garden of roses (it is still to be seen) and he invariably lived in that Garden. Rose-water was used by him for his daily baths. Tanah Shah lived at Daulatabad as a prisoner for 14 years and died in 1701. He was buried near Daulatabad and his tomb is still visible at Razi. Thus strangely enough Tanah Shah experienced prison life (though not rigorous) for 14 years like his victim Ram Das, and passed away in 1701 in Dandakaranya.

AMERICAN FRATERNITIES AND SORORITIES.

BY

MR. RAFIDIN AHMED.

IN America the words Fraternity and Sorority are used to represent student organizations. It is the purpose of these pages to explain their unique characteristics.

College students, all the world over have a marked tendency to form themselves into societies. Whether founded upon a rational, literary or social basis these organizations seem to have been coeval with the colleges themselves. Throughout the United States there is a class of students' societies, nominally secret in their character which have rapidly grown in favour and have become of great importance in the college world. They are composed of lodges or branches, placed in the several colleges, united by a common bond of friendship and a common name generally composed of Greek letters. From this latter fact they are known as "Greek letter Societies".

The name of each Fraternity is composed of two or three Greek letters, as, Kappa Alpha, Chi Phi. These letters commonly represent a motto, supposed to be unknown to all but the members. The lodges situated in the various colleges are affiliated and are termed "chapters."

These fraternities have distinctive badges. First, a shield of gold displaying upon it the Fraternity name together with symbols of general or peculiar significance. This is worn as a pin or a pendant from a watch chain. Secondly, there is a monogram of letters comprising the name. Thirdly, some symbol representing the name of the society, as a skull, a harp, a key.

In the early days of these fraternities only seniors were admitted into membership, but the sharp rivalry for desirable men soon pushed the contest into the junior class. The general rule

is however, that members shall be drawn from the four undergraduate classes. As the colleges usually open about the middle of September, the campaign for fresh men is then commenced and lasts until Christmas, when each Chapter has secured its most desirable candidates. When there is great rivalry, however, initiations take place all the year round and the chapters continually surprise each other with new members.

The administrative, the executive and in some cases the judicial functions of the government of these societies were gradually vested in a body of *alumni*, sometimes elected from one locality and sometimes connected with one chapter, who acted in precisely the same way as the board of trustees of a college. In order to keep the alumni interested in the work and progress of the order, chapters have been established in nearly all the large cities, forming circles of cultivated men, who would not otherwise know each other, and who by keeping alive their interest in college life and doings, advance the cause of education in many ways. The literature of these societies include catalogues, song books, histories, music, magazines and journals, and so they develop in a way, permanent and periodical literature.

Since the fraternities have been firmly established, graduate and undergraduate members have united in contributing toward building funds and have built chapter-houses and halls, sometimes at great expense. The creation of building funds, the frequent consultation as to plans and the consideration of ways and means have intensified the interest of alumni in a way that nothing else has done. The advantages of chapter house system are not altogether on the side of the student. They relieve the colleges from the necessity of increasing dormitory accommodations and also of many of the details of supervision over the actions of the students.

Co education is the popular and prevailing system of College education in the United States,

About seventy per cent. of the five hundred colleges in the country are co-educational. When the opportunities for collegiate training became a possibility for women, it was but natural, especially in co-educational institutions, that college girls should be anxious to enjoy the advantages of Greek-letter societies. It is not surprising then that one-third of the existing Sororities were founded at co-educational colleges within three years after the admission of women. They are run on exactly the same line as the Fraternities.

The benefits of these organizations have sometimes been exaggerated. But considering all sides they are not wholly undesirable. These Greek-letter Societies give a perfect home life, coupled with all the advantages of a college boarding house life. The distinction between the college classes is done away with and there grows in its place a strong college spirit. Another opportunity that the Societies open to their members is the chance they get through correspondence, publications and conventions, to get a wide outlook over the whole field of collegiate education.

There is this much to be said against these organizations, that they develop a sort of aloofness from, and sense of superiority to, the non-frat. man. And these in a democratic country like America, are disliked. For this reason, some of the States have prohibited the formation of these societies. Princeton is the only one among the higher educational institutions in this country, that prohibits these societies. Taking as a whole, they have exerted not a little influence upon American College life, and for that reason, if not for any other, they would be worthy of note.

A JAPANESE TEACHER.*

BY

MR. V. S. SWAMINADHA DIKSHITAR, B.A., I.T.
(Officer, d'Académie, Pondichery).

L'ECHO de Paris mentions one trait in Japanese manners which is both singular and calculated to inspire teachers in all countries with the highest and the most serious thoughts.

What is the highest, the most just, the most significant and the most useful recompense that a country can bestow in this life on one who has rendered it distinguished service? Japan has given to this question an answer whose meaning we shall all do well to pause and meditate upon. On General Nogi, who took Port Arthur after a siege the terrible incidents of which we have not yet forgotten, Japan has bestowed a national honour, but in the most unexpected, delicious and touching manner. It has made him a teacher!

Not the head of a Military School or a Polytechnic, as one may suppose, but a teacher, a simple teacher, who will have to teach boys of 8 to 10 years of age.

This fact, unexpected, but elegant, will be almost incredible, if not attested to, not by the Japanese journals which find it too natural to say anything about, but by Mr. Loudon, the gallant gentleman who was then the Dutch Minister at Tokio and who has since been translated to Washington.

He says that he was paying his farewell visits owing to his transfer and that among those from whom he wished to take leave was General Nogi the victor of Port-Arthur. He therefore went to the General's house. He was not at home. Mr. Loudon was told that he would return soon, as he did every day, as soon as he had finished his

* The reference here made is to the late General Nogi. The article gives a picture of the great warrior as a simple schoolmaster—an aspect of his life that was hidden beneath the blaze of his military triumphs.

class "Finished his class?" Mr. Loudon did not understand it at first. They explained the fact and gave him the name of the school where the General did his work punctually. The visitor spontaneously desired to go there and pay to the valiant soldier his most heartfelt homage at the civic theatre where he now exercised talents of a new order.

"I found him," says Mr. Loudon, "among boys the oldest of whom was not ten years old. The history lesson was just over and the General now presided over a lesson in fencing which the little chaps practised under the orders of a monitor to whom he gave directions, himself assuming appropriate postures and naming the movements which the children repeated."

There can be no two opinions about this, in his rejuvenated simplicity, it is very pretty. A people having such traits of genius, as to have their children educated by their own heroes, with a view to communicate more directly and more intimately the sacred flame of emulation has decidedly no equal. *Cincinnatus the schoolmaster* surpasses *Cincinnatus the ploughman*.

MORALITY AND RELIGION.

BY

REV. E. L. KING, M.A.

Principal, M. E. Mission High School, Belgium

THE underlying cause of confusion and uncertainty in practically all recent discussions of the question of moral training in this land is a failure to distinguish between morality and religion, a failure to see the bearings of one upon the other. This failure is seen most decidedly in the desire, expressed or implied, to keep them distinct and apart from each other. Sir Alfred Lyall, in his "Asiatic Studies" has remarked that "in India, few people would admit that their religious beliefs were necessarily connected with morality," and states his belief that the great difference between East and West is the

fact that "in Europe, morality can on the whole, dictate terms to theology. In Asia theology is still the senior partner, with all the capital and credit, and can dictate terms to morality, being, for the most part, independent of any connection with it." The truth of this is scarcely open to question but there is much to say on its practical bearings not only on that more or less formal pedagogy that we call "Moral Training" (with much emphasis on the "Moral" and little on the "training"), but also on the moral problems that increasingly face both individual and society. Are the two distinct, not in practice, but in their fundamental and basic characteristics? Is there no essential relationship that not only binds but modifies and controls? If there is, to try to teach a religionless morality is folly; if there is not, what are the roots and qualities of the deserved morality? This question is taken out of the realm of theoretical discussion by that problem that is necessarily facing this land, a problem in which, if we will only see them, are found all the large questions of not only the future of education but also the larger questions of national quality and character. Price Collier speaks in no uncertain terms when he says, "I am unorthodox, I might even be dubbed a heretic by the narrow, but I am bound to confess if ever a nation suffered from physical and moral dryrot, as a direct result of secular education, it is France." And that too in the face of the fact that France has the most highly developed, the most pedagogically perfect, system of moral education of any nation on earth. The problem, apparently, is worthy of consideration.

The confusion has partly resulted, I believe, from an uncertainty in the very definitions of morality and religion. By well ordered definitions both morality and religion can be made almost anything desired. Where the error in definition appears is frequently not so much in the definition itself as in results coming out of adherence

thereto. To do full justice to morality necessitates making it more than mere morality. The definition of Professor Curtis* satisfies the larger needs of the subject. It runs thus: "Whenever a deed, whatever its form, is done, not because it is the point of least resistance, not because it receives commendation in society, not because it gains money or votes or influence, but directly and only because to us it is right, that deed is intrinsically moral. This statement I refuse to modify by so much as a stroke."

As to what "is right" will appear more clearly as the discussion as to the real characteristics of morality opens up. Morality to the ordinary man, and even in definition, is rarely a unity. There is superficial morality based on self-advantage or an inherited disposition which the mental and moral inertia of human nature finds it difficult to shake off. There is bare morality as well as formal and sporadic morality. All of these are moral, in some senses, but neither fully nor righteously moral. Bare morality fails because of its lack of a unifying principle; it is too scattered. Man "cannot control the depths of his individuality. He cannot gather all his moods, all the flying moments of desire, all the dim basic longings of his nature, all the subtle interlacings of his soul—he cannot get together." And the reason is clear—it is but morality and nothing more, morality finding its basis in itself, and a shifting one at that. Wordsworth has hit upon the futility of such a morality in a world of deep spiritual concern.

"Go and demand of Him, if there be here

In this cold abstinence from evil deeds,

And these inevitable charities,

Wherewith to satisfy the human soul?"

Its bareness springs from a fatal ignoring of the soul, rights of race and individual. Formal mora-

* To whose illuminating discussion of moral personality I am indebted for the fundamental assumptions of this article.

lity is simply societary conformity. Right motives rarely enter it as elements and forces. Sporadic morality, while it utilizes considerable motivation, is erratic and capable of meeting only isolated needs and situations. It has no staying power.

But the higher reach, greater than that of a superficial, bare, formal, or sporadic morality, is that of a morality that is *personal*. Its personal character enters when it looks upon right as a totality, incapable of modification or emendation, and assumes a personal loyalty to its demands in deed, word, principle, and spirit. Absolute loyalty and a large inclusiveness are its outstanding qualities. It demands personal surrender and herein is its strength. A morality failing continuity cannot demand personal surrender, because it furnishes no ideal that continues long enough to produce a sense of obligation. Other moralities adjust themselves, personal morality creates its own adjustment. It co-ordinates all the valuable elements in man's spiritual nature and weaves them into a garment for his life, rejecting the loose and broken strands.

But to emphasize further the obligatory character of any true morality, its outstanding loyalty to ideal, its unswerving truthfulness to life and its needs. Any element that is mechanical to the slightest degree, is fatal to this type. Professor Huxley somewhere says, "I protest that if some great power would agree to make me think which is true and do what is right, on condition of being turned into a sort of clock and wound up every morning before I got out of bed, I should instantly close with the offer." But is this the Professor Huxley whom we know? Is he not rather the man who could write to Charles Kingsley out of the very depths of his loyal nature, "still I will not lie!" Does not the very acme of morality appear only in the midst of struggle and spring from those parts of a man's nature that are least mechanized? Matthew Arnold, in one of those phrases that somehow spring into use and become

the watchwords of unthinking movements and men, has told us that "conduct is three-fourths of life." But conduct never plays that commanding part in life save when it expresses personal moral intention and a clear cut choice of righteousness. In no otherwise can it have any ethical value whatsoever. We must probe down to the level of the underlying motivity and search it out to its deepest depths. Another phrase and idea that has often been used as a watchword and sanction of weakness in moral decision, of stagnation in moral action, is that voiced by Browning when he says that it is "not what man *does* which exacts him but what man *would* do." Only when man is dominated by motives that are subject to a high personal and moral ideal, a unifying and commanding ideal, has he any right whatever to place the slightest trust in this maxim. The only deed that can be morally judged is a deed expressive of his longing purpose, and ideal, not a *statement* of longing or ideal, but an *action* expressive of all that they are and mean only when such longings, purposes and ideals, moreover, are strong enough to bear subjection to test as to their worth should they become principles of universal law, can they be said to be truly moral, for only that which is good for the hive is good for the bee. A large view of life in its entirety is a pre supposition of a worthy morality. Only when grounded on these principles does society sanction have any wright at all. Absoluteness and universality should characterize all morality, and, what is more, an absoluteness and universality not of theory but of life and life's results. But it is right at this point that morality begins to fail. No one seeking absoluteness in character and life can find it in a mere morality. It fails to satisfy. Frequently, filled with good deeds and a certain kind of business, it may for a time and cover up its partialities and think itself to have attained to the ultimate. But unless stagnation and regression are to result a further analysis is

a necessity, and such an analysis can lead a man nowhere else than face to face with his soul. And men, perhaps the majority of men, shrink from the facing of themselves. Hence they solve their conscience by falling back into the easier forms of a so called morality, or even into immorality itself. This break-down is fatal, for the moral character is a totality whether we so see it or not, and a sin against one part of it is a sin against the whole. The weakening of one of a set of motives soon saps the whole set of any propulsive power. The whole moral character is emptied of urgency, and religion becomes impossible. But should the situation be manfully forced, should the unsatisfied soul throw itself on the Almighty, should its sense of the supernatural be accentuated, at least the first faint glimmer of religion is seen.

Let it be strongly emphasized, then, that no morality in itself, no matter how high, no matter how near it may approach permanence or universality of application, can be satisfying or ultimate. "Morality touched with emotion"—another of those plausible but shallow phrases—is inadequate. To the stock of motives must be added that of holy love, grounded in God and expressed towards Him and His creation. The moral law, when touched by love, will cease to be taskmaster and become Friend. This new motive "will dominate every word, make all idiosyncracies coalesce, bring every wandering element of manhood into organic simplicity and beauty." However we define religion it will in the end come to this. Its reach may be higher and its sweep broader, but deep down it will be this, and this alone: "In the perfect love of the perfect God is found the flower and perfection of such (i.e., normal) religion. It presupposes a true knowledge, a right impulse, and issues in a well balanced expression toward God and man."

THE MEDALS OF CREATION.

BY

MR. V. KRISHNA MENON.

THE earth has preserved in its bosom the remains of various animals and plants, which are not at present existing on any part of our globe. The bones of certain elephants found in Salamis had been identified by the ancients as belonging to Ajax and it is well known that many people used to bow down before a huge skeleton, found in Sicily, in the belief that it formed a part of the single-eyed giant Polyphemus. The mediæval people had no idea of the existence of any creatures other than those that were found then. Naturally they believed that the skeletons of some huge creatures, were the faithful remains of the great ancient warriors. The shells found on the mountains of Europe were considered by the men of the seventeenth and the eighteenth centuries, as scattered by the pilgrims, who came from the four corners of 'the known world' to visit the holy city of Rome.

In the dark ages, when civilization had not begun to exercise its humanising influences the people were steeped in blind superstition. To them science was a miracle and the cause and effect of the natural phenomenon were equally alien. They thought that these subterranean organic 'remains' were only the 'freaks of nature.' Careful investigations of the last century revealed to us that the fanciful ideas of the ancients were fabulous. The work-shop of the world was thrown open and then it brought home to our hearts that the so-called "fossils" were nothing more than "the body or any portion of the body of an animal or plant buried in the earth by natural causes, or any recognisable impression or trace of such a body, or part of a body."

The science of the study of fossils,—paleontology, as it is otherwise known—is of a recent origin, and can be considered as the youngest of

all sciences. Although the fossils were considered as the organic remains even before the Christian era by Aristotle and Xenophon, they could not form any correct idea of their existence. The names of J. B. Lamarck and Cuvier are inseparably associated with this science. The former, in the beginning of the nineteenth century, threw a good deal of light upon the hidden treasures in the womb of the earth, which consisted of animals devoid of skull and backbone, and the latter, his contemporary, astonished the people by his marvellous discoveries of many back-boned animals, which he conclusively proved to be the animals that grazed on the lap of this earth and became extinct in the course of time. This excited the interest of many a scientist and in a comparatively short time it grew in importance and became an essential branch of biology—the science relating to the living beings—and Geology, the science of earth. The progress of this science was accelerated by the timely intervention of Charles Darwin, who has won an immortal fame, as the author of "The Descent of Man." Interest was awakened, unknown regions were explored and the fossils of animals and plants un-heard of and un-dreamt of were brought to light in a small epasm of about fifty years.

These "remains" of animals and plants are met with in the interior of the earth. Our earth is supposed to be covered up with two kinds of rocks. One of them is composed of hard masses, like granite, and the other kind is formed of slabs or layers of rocks, one above the other as in the slate rocks. Fossils of animals and plants are found only in the latter variety. The rocks that are already in existence are washed down and the particles are deposited in the bottom of the seas and lakes. Animals and plants that are carried down by these currents and the creatures of the seas and lakes that die and find a calm grave on the bottom are preserved for ages and ages by the blanketing of the sediments that fall upon them

and which prevent any external agency to act upon. It is the marine creatures that are kept in numbers, for they are in a more favoured position for preservation among these slabs. The soft parts of animals, being easily decomposed in water, are not preserved for a long time. The animals should not be exposed to the atmosphere, lest they should be oxidised shortly. The important requisites for the preservation of the parts of animals are the possession of a hard skeleton and the covering up of the substances by fine deposits.

The "medals of Creation" occur in nature in different forms. Sometimes the animals are kept intact, without undergoing any change. In Northern Siberia a mammoth and a woolly rhinoceros have been discovered entombed in ice. This does not occur always. Every preservation depends upon the material of the structure of the animals and the medium in which they happen to lie. The skeletons are, however, very often met with unchanged. When the animals and plants fall to the bottom, decomposition sets in, and in some cases it so happens that some gases evolve and carbon particles take their place. The coal that forms an essential ingredient for most of the commercial and industrial concerns are the remnants of the thick vegetation of those past ages. The impressions left behind on the ground or on substances, which are afterwards hardened, also form another feature by which the existence of animals can be traced. Frequently we meet with the cast of the shells of different animals. In addition to these very few animals are preserved with all the minute structures, but in this case the materials of the substance have been replaced by a different set of minerals.

The deeper we go into the interior of the earth, the older the formations of rocks we have to pass through. The oldest layers are jacketed over by the later ones. If we go deep enough to trace out the first habitation of the animals, we find that the oldest rocks are studded over with innumera-

ble animals, that have no back bones. Later on the fishes appear. These are followed by amphibians. In the race-history of animals we find that reptiles succeed the amphibians. After these creatures, comes the stage of birds, which are in turn succeeded by the animal, that occupies the highest pedestal in creation, the mammals.

The account of the reptiles, that peopled this earth at a remote period strikes us with awe and astonishment. A kind of 'fish-lizard' was found to measure 33 feet. In 1822 a marine lizard was discovered, which attained a length of about 75 feet. Dreadful to behold! In America another extinct species of a reptile possessed three powerful horns.

"After a storm comes a calm." While we pass beyond the scene of the monstrous reptiles, we come to a peaceful atmosphere where mammals,—animals which allow their young ones to suckle—predominate. In the gypsum quarries of Paris abundant fossils of two kinds of animals are seen. One of them is supposed to connect the Pig family and the ruminants, while the second animal is an intermediate between the horse and the rhinoceros. Mammals resembling an elephant in shape and much bigger also appeared in those times.

Mastodon, which bears a close resemblance to elephants was first discovered in 1840 in North America and this is at present set up in the British Museum. The frightful Sivatherium—the name was derived from the God Siva—one of the largest of extinct animals known, is found in India. It was a stag, as large as an elephant, and endowed with four horns. In India, we had eleven species of elephants, and most of them have perished, leaving only one species to flourish in our days.

The evolution theory, which was propounded by Darwin, is well illustrated by a study of the fossils. The discovery of a bird, belonging to the genus *Archæopteryx* is considered as a valuable gift to the

upholders of the theory. It stands midway between a bird and a reptile. It possesses wings, tails with feathers and fine teeth. This animal is supposed to be a connecting link in the chain of the progress of evolution. By the study of the modification and diminution of the toes of a horse, whose fore-fathers had five toes, we learn how organs are modified and function precedes organs.

By the presence of terrestrial and marine creatures, and the trees in position, we can with some accuracy determine the past geography of the earth. The climatic condition of the land can be ascertained, if we examine the past flora of the particular region.

To the geologist the fossil is a reliable companion. A rock in Europe, containing a certain fossil, will be as old as a rock found in Asia or America with the same kind of fossil. The rocks have been divided into epochs and again subdivided so that the same strata in different parts of the globe have the same fossil remains. This becomes a strong evidence in fixing the age of any layer of rock.

The structure of the teeth and abdomen gives us some clue as to the nature of the food of the animals. Those animals that have sharp pointed canine teeth are considered as flesh-eaters and those fossils, that have rough flat teeth and comparatively large stomachs are herbivorous.

Throughout the length and breadth of India^{*} the *Saligramam* is considered as very holy and deep adoration is paid to it by the Hindus. To the orthodox people it may be revolting to hear that they are the ammonite fossils, found largely in Nepal. It has also been found that fossils are used in certain parts of the world as possessing high medicinal value, and in times of dearth the Laplanders and the people living on the banks of the Amazon are living mostly on a kind of soil rich in the deposit of microscopical shells of the extinct organisms.

SOCIAL SERVICE IN INDIA.

BY
MR. MANU SUBEDAR.

"The removal of this or that particular defect or vice should not be the only end and aim of the agitation to improve our social condition. The end is to renovate, to purify and to perfect the whole man by liberating his intellect, elevating his standard of duty, perfecting all his powers . . . Where this feeling animates the worker, it is a matter of comparative indifference in what particular direction it asserts itself and in what particular method it proceeds to work,"—*Ranade*.

THE welfare of humanity is the most important subject that can engage our attention and inspire endeavour and sacrifice. A healthy civilised society has a certain measure of regularity and foresight in life, control over environment and provision against contingencies. Attempts will be made to have an intelligent grasp of social tendencies, to formulate social aims and ideals and to find and organise means and agencies for eradicating or palliating evil, and conserving or advancing good. Misfortune will not catch them napping. No opportunities for progress or reform will slip through their fingers.

In the Social organism, life and vitality must run from where they are abundant or superfluous to those weaker members who need them. Channels must be kept free for this beneficent flow of energy. This is the problem of Social Service. But the term has been used by Socialists* to draw attention to the question of inequalities of property and the possession of money "which commands social service," obviously meaning economic services. The interpretation which makes the distribution of property responsible for the wrongs of society is confusing and fails to include those philanthropic and quasi-philanthropic efforts at remedying social evils some of which are due to deep moral defects and others susceptible of a moral cure. It is to this disinterested work which reaches communal life as a whole and

* Vide "Social Service" by Louis F. Post.

all its departments that Social Service commonly refers. In theory its outlook is wide and synthetic, in practice no individual item can be too small for serious consideration.

The secret of social organisation lies not only in giving an incentive to every individual to live his best but in providing suitable social environment for the fulfilment of that impetus. The bulk of mankind are moved by the social machine, and are unable to know or do what is good. It is the task of social workers to ascertain and make good any deficiency in the relation of social efforts to social wrongs. Beneficent and progressive forces within society must be kept efficient by organisation and co-ordination. They must awaken the conscience of the community to their responsibility for existing evils. They must seek to quicken social sympathy between classes, the well provided and the destitute, the strong and healthy and the weak, defective and invalids, the literate and cultured and the ignorant toiling masses of humanity. But doctors who have to cure social diseases must adopt the same intelligent attitude as physicians and must study the normal tendencies and course of development of the organism. Hence the importance of social study. Social work is never so effective as when based on an intelligent social philosophy. And yet social servants must be eminently practical. Inspiring ideals may form the moral backbone of social efforts but no plan of social amelioration which neglects any possible accession of strength from existing institutions, prejudices tendencies etc. can produce great or lasting results.

It is not easy to make a survey of and criticise social service in India. There is a bewildering diversity of conditions and the field of social inquiry has been ploughed superficially. Social history has been irregular and obscure. Few thorough studies in the life and labour of the people have been produced. There is a great confusion of religious theories and pious practices

The finer relations of political environment and social institutions and opinion have not been sufficiently weighed. And the task is not simplified by the economic transition through which the country is passing as a whole.

The field of Social Service is strewn with many efforts of all kinds and sizes of which it is difficult to have an intellectual grasp. We shall make a division, more convenient than logical, of social agencies in six groups but it may serve to remove misconception, if it were remembered, that through different channels, the same human field is watered. All the work has only one aspect, so far as Society is concerned the weak, the needy, the helpless are assisted and the vitality of the community is increased.

A great agency of mutuality resting on biological and social instincts of men is the family, in which moral and material benefits flow to the weaker members in numerous ways*. As a scheme of social insurance much may be said for the joint Hindu family. But under a new set of conditions the individual comes by not only freedom to rise but to fall in the world. The old system tends to break up, beginning with the large cities and many of the services might be transferred to the domain of the state or local bodies or trade unions. It is to be wished in order that the hardships of the transition may not be great that the disorganisation should not be rapid.

Castes hold an important place in social service on account of their providing effective regulation of beneficent social practices. Their size, their visible and popular character, the funds and powers at their disposal render them a very promising agency for social work†. And they are in a

* Cp Lunatics in 1901 in India. Total 58033. In Asylums 4020, the rest being presumably taken care of by relations.

† Cp At the sitting of the Lohana conference in Bombay last year as many as Rs. 400,000 were promised for educational purposes.

vague manner adapting to modern conditions. Orphanages, lying-in hospitals, dispensaries, sanatoriums, cheap chawls, educational institutions and scholarships etc. are provided. Conferences are meeting to discuss social evils and promote the social welfare of the group. The compelling force of Caste and Social custom might be made an engine of social good and can be forced into the service of progress.

Group consciousness is asserting itself in a new form. Traders and professional men, capitalists and men of property, like grain-dealers, cloth-merchants, lawyers, stock-brokers mill owners, land-holders and others come together to guard their own interests. Working men in industrial cities are organising a kind of crude trade-unionism. Ramifications of co-operative efforts for thinking out and solving various problems are spread wide and deep in the body of the community. Conferences meet for the promotion of various objects, religion, political freedom, education, literature, medical research etc. Associations and societies, samajs and sabhas for all sorts of social purposes have sprung up. They provide a common platform and meeting ground, and secure maximum enthusiasm and close knowledge. The spread of self-help and united endeavour is like the spread of education, reaching first the few who may gain a temporary economic or social advantage. But society has everything to gain from these organisations. An extension of their sphere and an infusion of new aims and methods, may be desired. Nothing better can be done for poorer classes such as weavers, school masters, soldiers, miners, railway servants, pressmen, small-holders, actors, clerks, cab drivers etc., than to teach them to help themselves by organisation socially and economically.

India is the "land of charity" and of beggars. *Atithya* and *Dan Dharma* has led to indiscriminate alms-giving and has landed us into a social and economic situation of grave confusion and

waste. Only the moral and subjective aspect of charity has been considered and its demoralising effects on the recipient and the deterioration of the moral and physical stamina of society are neglected. We must seek to replace unreflective by intelligent methods and change a mass of superstitious practices into an organised system for the promotion of general welfare. There will always be genuine poor in need of assistance of various kinds. We must therefore aim at providing special treatment for special needs, as in hospitals, asylums for lepers and lunatics, institutions for the blind and deaf-mutes, homes for consumptives, boarding schools for poor students, *ashrams* for widows, labour exchanges for the unemployed etc., and thus effect a break-up of the miscellaneous class of those who shift on doles of corn or money.* An exposition of the vice and crime of city mendicants might have a chastening influence on public opinion. A Charities Register bringing deserving institutions before the public might assist in diverting the stream along fruitful channels. Perhaps the state may follow up any marked change in opinion by a stricter administration of the laws of vagrancy and even making the giving and receiving of alms an offence. It is time we had bodies like the N.S.P.M† and the Charity Organisation Society.

Some of the ideas underlying endowments here become obsolete. Some of the methods by which they are administered have become harmful. The spirit of the endowment is often violated by too rigid interpretations and mechanical processes which prevent their being "a living work for living beings." Laws of property, we are told, are "sacred" but more so are laws of life. There must be at least registration of charitable and religious trusts and an annual publication of the

*Comp. The minority Report of the Royal Commission on Poor Law 1909

† National Society for the Prevention of Mendicancy. The charity organisation Society of London "considers carefully all plans undertaken by municipal bodies, trade unions, Church and individuals" Wood's English Social movements.

report of the administration of funds. In India this is a field worthy of investigation by social workers and regulation by an enlightened state.

Religion provides a very powerful sanction for domestic, social and civic obligations. But it has grafted in our mental constitution certain ideas which it may take generations to remove or modify. For example, the fatalism and "excellent passivity,"* with which we meet private and public misfortunes may be a religious virtue but this gospel of helplessness blunts the edge of communal self confidence and social work, and fails to provide an incentive for investigation, human foresight and civilised methods of relief. Religion is however a powerful spring for human benevolence, which takes the form of feeding of Brahmins, protection of cows, facilities for pilgrims, endowment of temples, ritual and ceremonial extravagance, alms to the poor, maintenance of scripture schools (Patashalas), etc. By moral suasion or intelligent pressure, some of this beneficence might be made to promote allied but more useful forms of charity.

The new faiths, the Arya Samaj, the Brahmo (Prarthana) Samaj, and the Vedantic revival are pervaded with a distinct social aim and are adopting to a certain extent modern methods in social work. They are of indigenous growth and their attitude towards social evils is more or less enlightened and practical. The Theosophical Society is also exerting an influence for good so far as social service is concerned. The Christian missionaries are doing remarkable work in certain places in education and medical assistance. They have taken a whole view of social evils,† and have indirectly roused our social conscience.

The state promotes general welfare by legislation or executive regulation or various economic and social activities. Tradition and immediate

exigencies decide the limit and character of state-action. In India both these factors have concurred in widening the work of the state till the state has undertaken responsibility not only for security of life and property, but for education, public health, moral and material prosperity of the people. The work of the state ought to be better known to the public and ought to secure fullest co-operation from social servants, who would try to review and supplement that work. The theory of social non-interference is intelligible but not just. A vital department of life cannot be allowed to drift without regulation. There are many social evils of which only the fringe has been touched, in which the larger resources of the state must come in. Social workers must gather, sift and interpret facts and lay them before the people and the Government, between whom they aim at securing better understanding and greater co-operation.

With the growth of civic spirit there might be a vast field of usefulness for voluntary work in connection with municipalities and local bodies. The growing problems of towns and of the country, and the breakdown of old agencies of social work tend to increase their powers and multiply their responsibilities. Interest in wider problems of social and civic life is growing and the efficiency and intelligence of local councillors might keep abreast, one might hope, of the growing functions of local bodies.

Even if there is not the larger development of civic ideals or infusion of new thought, considerable attention is given to social welfare. States like Baroda attempt social reconstruction along modern lines. What with the education of princes, and growing improvement of officialdom, what with migrations, communications and healthy rivalry between the states, these social laboratories of India might form effective and important agencies of social uplift.

* Carlyle.

† Even if it is with absurd conclusions as in "In Darkest India" by Booth Tucker.

The new interest in the welfare of the community is not derived from the orthodox doctrine of charity to the poor. Not only in politics but in industry, art, literature and practical ethics can the new impetus be discovered. Whatever its name, it is the *esprit de temp*. It has given new vitality to the work of all the agencies that we reviewed so far. Social life is being viewed as a whole from the national standpoint and problems like the amelioration of the Depressed Classes and the advance of woman are being pushed forward. Institutions and organisations with modern aims like the Servants of India Society and the Seva Sadan have come into being. Modern methods of Social work are being appreciated. Social study and journalism are advancing. The social worker has got a new idea,—the service of the mother-country—to evoke public interest. He has himself become more enthusiastic and intelligent. He understands propaganda and seeks to create suitable psychological conditions by imposing conferences, experimental work, reports, lectures, writings, placards etc. There was much idealism and many visionary programmes at first, but now with wider sympathies new hopes, deeper faith and greater insight, patient and earnest work is being undertaken.

Having noticed the various agencies, it may be well to draw attention to some of the principal problems of Social Service. Every evil to which the flesh or spirit of man is liable, all classes of society who are in need of assistance either on account of age or sex, physical infirmities, misfortunes or social anomalies claim its attention. The problems may be best viewed in two rough groups, those that are incident to life in the country and agriculture and those that result from life in towns and refer to trade and industry.

The problems of Agriculture are of supreme importance because the large part of the population to whom they refer are mostly without modern resources and intelligent organisation. The agri-

culturist need better productivity of land, easier credit, equitable land laws, cheaper justice, medical assistance and sanitation, safety against famines and better prospects of material welfare. Increased productivity may result from wider irrigation, (canals or wells) new methods of cultivation, larger use of manures, better seeds, more scientific breeding and rearing of live stock, safety against wild beasts, locusts, and other pests. Indebtedness, which overtakes small agriculturists all the world over, might be gradually lessened by greater literacy which will render them less open to fraud in computation and bargaining, growth of deposit banking in market towns and by the successful operation of co-operative credit which not only affords monetary assistance but is a great moral lever.* Complaints are often heard about the incidence of land revenue, the burden of the Salt-tax and harsh tenancy laws. Ruin is brought to many homes by litigation and delays in the course of justice. Simpler tribunals, the punchayats in some form, might prevent much loss and misery and check demoralisation. A co-operative effort to have a poor man's lawyer might be a great boon, if it succeeded. Medical assistance is reaching a greater number of people every year through hospitals and dispensaries, but insanitary practices like collecting house-refuse at street corners, bathing near wells etc. must be seriously checked. Measures both preventive and remedial are also needed to protect the thousands who are killed every year by snakes and wild animals.

In ancient days stores of grain were kept by every family, by the rich and by the local potentate. The modern state have after many failures drawn up a workable famine code and made provision by a famine insurance fund. We have protective railways, irrigation and organised relief. Except certain isolated efforts by patriotic men, popular movements of charitable relief have

* Vide "Agricultural Banks," F. Nicholson.

been weak and planless. To improve the outlook of agriculturists pressure on the soil should be reduced by bringing waste lands into cultivation and by creating a diversity of industries. Better roads and cheaper railway rates might increase the profits of agriculture.

There is greater division of labour, greater money economy and greater complexity in town.*

The inspection of markets, the byelaws against adulteration of articles of food, the storage of food, distribution through shops and hawkers, the growing number of restaurants and tea shops are all matters which in the interests of public safety want serious consideration.

Water-works have been erected by municipal enterprise and are being pushed forward in many places. But the service might be made more facile and cheap by intelligence, sympathy and economy in administration. Regular inspection of wells used for drinking purposes is a desideratum.

Phenomenal overcrowding has been the result of rapid and planless growth of towns. And it is the poor who suffer most, morally and physically. This is a vast subject which needs plenty of investigation and divers remedies. In view of the important bearing of this on all social and economic problems, we cannot but regret that India had no Booth or Rowntree to study the life of her towns. The principal solutions suggested are municipal bye-laws as to submission of plans for new buildings and limits of air space for the individual, social discredit of the owners of chawls, who do not provide adequate sanitary arrangements, development of suburbs by roads and suitable plots, cheap and fast trains for working men, provision of open spaces and parks, widening of streets etc.*

Municipal Councillors, journalists and others can do great service if by their criticism and suggestions they can make the administration of the public health department less corrupt and more efficient. A host of services, some of which are at present supposed to be rendered, might be pushed forward in connection with inspection of houses, wells, stables, drains, etc., cleaning of streets and public places including public lavatories, vaccination, nuisances and similar objects. There is room for improvement in methods of removing house refuse.* But these and many more useful things can not succeed till popular interest and co-operation are lacking and till a sanitary Inspector is regarded with undisguised suspicion and hostility.

Games, not so long regarded seriously in the scheme of Indian life have been now recognised as of immense physical and moral influence on society. We have athletic clubs and gymkhanas in cities, and elsewhere games are spreading in a less ostentatious manner. Theatres and popular shows, circuses, etc., have come to be part of normal social life. Laudable attempts are made to remove coarseness from popular festivals like Holi, Tabut etc. Much work might be done in all these matters as well as about the promotion of parks and public gardens, museums, picture-galleries and menageries, public bands, Sanjit Samaj and other means of recreation. After all, provision of healthy pleasures insures not only healthy development but keeps off vice.

The Temperance Conference is doing good work in keeping the question of drink before the public mind. Growth of workmen's associations and clubs and provisions of counter attractions and of non alcohol-

* It is widely felt that the Improvement Trusts are setting the wrong way about and increasing the evil of overcrowding by pulling down buildings in the heart of the town and not making adequate provision for those displaced.

* Instead of its being thrown in the streets or being collected round carts at odd corners, a regular collection of dust-bins from house to house would make it possible to make a bye law against things being thrown in the streets.

lic* drinks might assist in reducing the evil among poor classes. An opinion exists that vigilance of castes might provide a check in the lower strata of Society. But if Abkari administration rested less exclusively on business principles and if the practices of brewers and publicans were scrutinised from time to time, wider and more immediate results might be obtained. A certain amount of regulation and enquiry are also needed in the consumption of intoxicating and soporific drugs like opium, cocaine, gangs, bhang etc.

Social opinion is too prudish and irresponsible about the growing evil of Prostitution† in the towns. But this attitude argues not only inhumanity towards the unfortunate "broken earthenware" and those whose wants they supply but a kind of social myopia. We want a Vigilance Society which will see that laws against abduction are strictly enforced, which will protect helpless girls from white slave traders both males and females, which will befriend the friendless and sympathise with the fallen and which will provide homes of shelter for those who are prepared to return to the pale of society and conform to its moral tenets.

Gambling is the most elusive of all vices which needs greater look-out from the State and Social workers. It prevails in towns in myriads of forms which those who would serve Society may discover and expose.

592,835 people passed through jails in British India in 1909-10 and at any time more than 100,000 people are suffering imprisonment. One cannot believe that they are all depraved‡ or that they are all beyond reclamation to civil life and

* The wonderfully rapid spread of tea as a normal drink among all classes of city population is noteworthy. It does in some degree keep off a desire for more stimulating drinks probably everywhere, but certainly among the lower middle classes of India, if such a term can be used.

† There were in India according to the Census report 116,888 prostitutes in 1901.

‡ Vide 'Justice' by John Galsworthy.

honest living. Excepting a little missionary work, we have no organisation for visiting prisoners and befriending them or helping them on their release. The functions of the "Court Missionary" so useful in modern countries are in India neglected. Prison industries are flourishing no doubt, but there is room for more humane and enlightened treatment of convicts. Greater independence of jail authorities from Local police would further the ends of justice and humanity.

If the Industrial Revolution is coming in India we may expect to profit by the experiences at least of England. And yet the same sad story of long hours, abuse of child and female labour, insanitary conditions, want of safety appliances, insufficient precautions against fire and other risks, lack of provision of time and place for taking food, no sort of schooling of young workers, no adequate compensation for injuries etc. is repeated with greater enormity on account of the passivity of the Indian. The factory laws, if strictly enforced, may lead to considerable betterment. Factory Inspectors, secretaries of Kamgar Sabhas and others may bring before the public many other evils not connected with the act. Mining is growing, there being already more than 140,000 men working and inquiry and inspection must be equally persistent about conditions underground. But the vast mass of non-factory labour is still abandoned to the unrestricted operation of economic laws without any protection or as much as an intelligent inquiry*.

Education is a great need in towns and the country. Various stages, different and diverse methods might, if space permitted, be considered. Many agencies are working for its promotion. One aspect usually neglected and one lending itself emphatically to voluntary work is "mass education." This might include University extension lectures, popular discourses accompanied

* Except in the monograph on certain industries published by certain provincial Governments.

by lantern slide, night schools for men, afternoon classes for women, free libraries, circulating libraries, cheap books, pamphlets, cheap press, exhibitions, museums, art galleries, etc

The poor need protection in many ways, against corrupt and unnecessarily harsh officials, against wily tradesmen, against those violent elements which infest certain places at certain times. Their welfare is promoted by savings banks but many other forms of thrift institutions, co operative unions and benefit societies are needed. Provision should be made against sickness and unemployment of the earning members, which are critical occasions when destitution, demoralisation and crime may follow. Measures might be taken against plague, cholera, etc, in which the poor find themselves helpless. Social customs such as those which require certain expenses on marriage, death and other occasions press more heavily on the lower orders of society.

Adopting a different principle of division, we may consider first the problems relating to women. They must be associated in the work of progress. The mysterious gentle influence which makes their presence and personality effective even in such impersonal work as nursing, teaching, etc, is gradually appreciated. But very little is being done; a few social clubs in the large cities where women are literate in a small measure, half a dozen magazines of exclusive female interest, an annual meeting which expresses many pious hopes are the principal outstanding features. The State has cautiously recognised their right in certain matters of law referring to property, marriage and domestic relations. The reformed minority, who are doing women's battle against custom and orthodoxy, are agitating on cardinal problems of social life, child marriage, female education, widow re marriage, abolition of the purdah and other restrictions which bear directly on the life of women. But very little headway is being made, the conserva-

tism of women themselves being no small obstacle. The pressure of economics may improve the outlook for the sex. Respectable women are beginning to live independently not only on property but from their professional earnings. The factory system has set a value on female labour altogether apart from domestic ties. Education not only general but in the care of children and in domestic economy, suitable conditions of work, medical aid and institutional care for maternity and wider meeting ground for light social purposes and enlightened discussions are among the great needs.

The S P C O* in India hardly works beyond large cities and very flagrant cases, and is not given sufficient publicity by journalists and others or co operation by the public. We have orphanages for helpless children and industrial schools for young criminals. Juvenile courts, school clinics, country holiday for the town child are some of the desiderata. The ignorance of parents is answerable for much misery as in the curious persistence in loading children with ornaments. The high death-rate among children is perhaps due to insanitary conditions and quick midwifery. Physical defects of children are often neglected on account of the parents' ignorance, superstition or lack of medical aid. Harsh and brutal treatment is often given to children, and of the educational efforts of parents we can hardly say much because in many cases there are none, in others only primitive.

Though a very small portion of boys and girls of school going age, students are the most important amongst them. Methods of teaching, school curriculum, training of teachers, physical drill, manual training, moral education, teaching of art and industries, medical inspection, open air classes, fresh air outings, games and recreations, food and boarding are matters in which there is a very wide scope for corporate action and Social work.

* Society for the Prevention of Cruelty to Children.

The hardships of poverty and cases of self-help among students are not properly looked into, considering their bearing on the enfoldment of genius and character. Students who are sensitive as a body are misunderstood by parents, by the authorities, by business-men and by everybody. They need sympathy, which is the essence of understanding. In this light the work of institutions like the Students' Brotherhood of Bombay which brings the older and the younger students together and improves the outlook of the latter on life must appear very useful indeed.

The large number of depressed classes and the nature of their disabilities make a grave problem. Economic and political situation is favourable to social justice and a recognition of the dignity of human existence. National sentiment makes it impossible to debar them permanently from citizenship and free economic life. Indigenous and foreign missions are promoting education and better living among them. In spite of a few associations amongst them, their helplessness is most pathetic. No efforts to relieve their situation of the more outstanding evils can be too great, no work more truly patriotic.

The progress of Islam runs on the same lines and its problems are more or less identical, except perhaps an aggravated form of illiteracy, religious bigotry and the Purdah. It has shown remarkable vitality and cohesive power and will certainly form the most energetic element in the future Indian community. The separate organisation of Mahomedans serves a useful function in progress but with growing education and deeper social consciousness, they will realise that blood is thicker than water. However, understanding, mutual sympathy and co-operation in social efforts are very necessary.

Disinterested Social service is a great moral asset to a community. But though of a lower moral order, the social value of the work, for example, of the monopolist who reduces prices, of

the business man who provides wholesome food, well-built houses, healthy literature etc., so as to bring them within the reach of the wage-earner, of the landlord who promotes experiments in agriculture, of the Prince who advances the prosperity of his subjects, is by no means small. In fact, if social service is effective and does its work, society will look to it less and less. It must be our fixed aim to transfer more and more items for the realm of isolated philanthropic voluntary efforts to the domain of State action or of corporate bodies or better still to make it worth while for the individual to perform those services by an adjustment of the standards of social duty or social living.

Pessimists and cynics have regarded social service as ineffectual, ineffective and visionary. Enthusiasm does often show greater than insight but constructive social work seeks to bring, practically, close knowledge of the principles of Social life to bear on the facts whose existence has been ascertained in a scientific spirit. If it does not reach this standard, it may still keep flowing the stream of moral goodness and social responsibility. Considering the extent and dynamic character of the moral and material needs of Society, who can wonder if charity goes bankrupt? And the psychology of the poor, the illiterate or the morally backward (including the rich) has defeated many plans for social betterment.

The human material, the object of social service, has its own laws like water flowing in a stream. A wise miller will look to the proper adjustment of his gears. Behind the curtains is the living world of changing facts which dry figures and brilliant theories are likely to obscure. Nowhere is pliancy more necessary, nowhere is routine a greater danger. Social service is not for the gratification of our self-esteem, the work is to be done for others and the inner life of these must not be stifled or disregarded.

India has been thrown into the great material whirlpool. Foreign capital sunk therein has drawn her into the system of world-credit. Her currency has come into parity with that of Western nations. Her trade has been linked to the great trades of the world. Communications have facilitated all this and made any isolated economic life impossible even in villages. New conditions in industry seem inevitable. Social institutions are bound to react in a certain measure to this impetus from vital economic changes. Blind conservatism and wild haste would both be fatal in the coming social reconstruction. New needs will arise as new conditions come and social servants will have to adapt themselves in the face of popular prejudices and vested interests, social, economic and political. Discouragement and opposition will not daunt them. They will march forward, "the soldiers of God," passing the torch from hand to hand.

THE COCHIN CENSUS.

BY

MR A. P. SMITH

 R. C. ACHUTA MENON, B. A. Superintendent of the Census operations in the Cochin State has made a very concise contribution to the General Census of India in his Report for 1911. The map and diagrams are excellent in their way, and the information given has been cut down to the barest facts, and the inferences drawn as restrained as much as possible. This is in accordance with the instructions of the Census Commissioner of India, and because all other necessary information is to be found in

other publications. To the general reader this is disappointing, for Mr. Achyuta Menon's opinions and deductions from the Census figures would have been most welcome as he knows Cochin as no other man does; and as the accomplished author of the *Cochin Manual* we are sure that had he given his pen free play many interesting sidelights would have been thrown on the last Census returns.

The density of the population is greatest in the Coast or back water Taluks and where the coconut palm grows in profusion and produces largely. Mr. Achyuta Menon ascribes the pressure of population entirely to the cultivation of the coconut and the manufactures of produce derived from that valuable tree. The urban population shows signs of a marked tendency to increase owing to industrial and commercial enterprise, being 26 per cent. While the natural increase of population is only 13 per cent—three per cent less than in Travancore where there is a tendency to agricultural expansion. The joint family system exists, says the Superintendent, in "its pristine vigour"; several families consisting of over one hundred members in number while the average ranges from 12 to 20. How inconvenient and opposed this must be to individual effort, or even co-operative action in business—for in business a relative often makes business impossible—may be conceived, and it is a hopeful sign that there is a growing tendency to partition and separate interests. Emigration due to pressure of population being at a little over the rate of 1 per cent. per annum is increasing, though there are, as yet, no signs of acute pressure causing a want of subsistence; and a steady increase at, what Mr. Achyuta Menon considers, the nominal rate of one per cent. per annum is anticipated for some years to come. Two thirds of the population are Hindus, one fourth Christians and seven per cent. are Mahomedans. The Jewish population has shown no variation for the

last 86 years—a fact which is not accounted for, and for which there must be some special cause. The proportionate density of the Christian population is paralleled only by Travancore, and conversion to Christianity and Mahomedanism from the depressed Hindu castes is largely accountable for the decline in the Hindu population—though there are probably other reasons which are not mentioned. Mahomedans and Christians are more prolific than the Hindus, but, says the Superintendent, the more rapid decline of Mahomedans and Christians as compared with Hindus as they advance in age, is as inexplicable as their greater prolificness. An explanation probably offers itself in the fact, noted elsewhere in the Report, that Hindus, as a class, are more devoted to agriculture than either Christians or Mahomedans.

Though the conditions of life in Travancore and Cochin are very similar it is strange that while in Travancore the males are in excess of females by nineteen in every thousand, there are seven females in excess to males to every thousand in Cochin. The same preponderance characterises the Jewish population while it is the other way with the Christians and Mahomedans and Animists. The deficiency of females in the last three communities is more apparent than real and is due to erroneous enumeration pointing to the conclusion that the excess of the female is general. No explanation is offered. In this connection a hint thrown out by the Census Superintendent of Travancore, *re* the causation of sex appears to be *appropos*. "It is believed," he says, "that overfeeding of the maternal parent favours the procreation of the female sex, and moderate feeding of the male, and that when to deficient feeding overwork is added, sterility must follow." The Hindu women of Cochin are perhaps more valued and kept more comfortably than women in Travancore and elsewhere. They are consequently well fed, and have no hard work to do and the increase in girl children follows. That the sex of the honey

bee is determined by a special dietary is a scientific fact. Marriage is universal in Cochin and the average age of the girl is 14 and the man 20. Christian males generally marry earlier and Christian females later than Hindu, while Mahomedans of both sexes marry later than Hindus and Christians.

Educationally, Cochin is in the foremost rank, and in regard to female education she leads the way. Mr. Menon referring to literacy among Christian sects apparently had a bone to pick with Protestant missionaries, for he says, that worthy body is under the impression that the comparatively high proportion of literates among Native Christians is due to the diffusion of education through Protestant agencies. He says, that though there is a higher proportion of literates both in English and in the Vernacular among the Protestants, their removal from the total number of Christians in the State does not materially alter the position of the Christians as to literacy. The comparatively high percentage of literacy—not necessarily English literacy—is not the result of modern administration and was as widespread many decades ago as it is now. The Durbar has merely systematised and stimulated this general desire for education. Though caste still is predominant it is decaying, and hereditary and traditional forms of labour are being discarded. That is to say, in Cochin as in Travancore the Socio-economic caste system and co-operation is being disintegrated and broken up. While this is going on, Mr. Achyuta Menon says, caste prejudices are carried in conversion into Mahomedanism and Christianity indicating how stubborn is the resistance to a system which has influenced India for centuries. Some interesting remarks are made in the chapter on occupation, but the exigencies of space preclude our noticing them. We must congratulate Mr. Achyuta Menon on his workmanlike report, with the qualification that he should have "let himself go" on questions which are passed over with but slight comment,

EDUCATION FOR CITIZENSHIP.*

A REVIEW BY

MR. T. V. SIVAKUMARA SASTRI, B.A., L.T.

THIS is an eminently practical book. It deals with a most intricate and knotty problem, which is the one great concern of Society all the world over,—the education of the rising generation; and the author has brought to bear on the discussion, along with his knowledge of Pedagogy and Economics, a broad outlook and deep sympathy. Most pupils have their education stopped with the course they go through in the elementary school, while some have even to go without the full benefit of its educative influence. It is a strange and paradoxical situation that, while the richer boys that enjoy wholesome home influences are fortunate enough to have their school course continued, the poorer ones who lack such influences have further to deny themselves the advantages of an extended course. When these enter life, which they have to do almost immediately, they are exposed to the risks and snares of an uncontrolled life before their character has been fully formed. It is, therefore, extremely necessary that something must be done to have their instruction continued beyond the compulsory elementary school stage, and to place before them an ideal of conduct and duty. Education for citizenship must, especially in the case of such pupils, at every point be dynamic. Mere mechanical getting up of definitions can never give the necessary training. The pupil should be made to appreciate in a concrete manner, the reasons why he should do the things in the way in which the regulations enjoin them on him. Not the subjects of general educa-

tion, not even a theoretical knowledge of civics but the *exercise* of the civic virtues is the most important need. Education for citizenship is thus only another name for the training of the will, developing and directing it to good purposes and the formation of the moral character. The author, therefore, most appropriately discusses in this connection the whole question of the philosophical basis of moral education in general, and Chapter IV of the book is a most valuable contribution to the literature on the question of *Egoism versus Altruism*. The actual scheme of training that the author lays down on this philosophical basis is not therefore a narrow, utilitarian one. We should begin by appealing to the selfish interests of the individual and by making him do his work with delight for the general welfare of the community of which he is a member and regulate them gradually so as to foster the nobler spirit of a *discerning altruism*. Work is an excellent means of training; it disciplines the individual. The school is usually far removed from the daily interests of life and Society, whereas, properly speaking, the school ought to be life, the school ought to be society. Hence the main principles underlying the work of the continuation schools are practical activity in the school workshops and the organisation of school life on the lines of a self governing Society. The whole organisation with the details of the scheme and the methods is sketched in Chapter V which will amply repay perusal. The details are extremely instructive and possess the rare merit of their efficacy having been tested in successful practice. The whole book is full of solid reflections and significant practical maxims and we may well endorse Prof. Sadler's remark that the book is a "Landmark in the History of Education."

* "Education for Citizenship" by Dr. George Kerchen-
stenor translated by A. J. Press. Lond., George G.
Harrap & Co.

MR. THEODORE ROOSEVELT.

[Mr. Roosevelt, as he was leaving the hotel to drive to the auditorium to address a large gathering of his supporters was shot by a Bavarian Socialist and the bullet lay lodged in his body between the ribs. Before he was taken to the hospital he addressed his constituents and said: "I don't care a rap about being shot. It takes more than that to kill a bull-mouse. But I will disown any man of my party who attacks his opponent slanderously.]

IN A CHAMPAK GARDEN.

BY

MRS. SAROJINI NAIDU.

Amber petals, ivory petals,
 Petals of carven jade,
 Scattering your ambrosial sweetness
 Richly o'er field and glade,
 Foreloomed in your hour of exquisite glory
 To shrivel and shrink and fade!

Thou' mango blossoms have long since vanished,
 And orange blossoms be shed,
 They live anew in the luscious harvests
 Of ripening yellow and red,
 But you, when your delicate bloom is over
 Will reckon amongst the dead.

Only to girdle a girl's dark tresses
 Your fragile hearts are unveiled,
 Only to garland the vernal breezes
 Your fragrant stars are unfaded,
 You make no boast in your purposeless beauty
 To serve or profit the world.

Yet 'tis of you thro' the moon-lit ages
 That maidens and minstrels sing,
 And gather your buds for the great God's altar
 O radiant blossoms that fling
 Your wild, impetuous, magical perfume
 To ravish the winds of Spring.

HIS EXCELLENCY LORD PENTLAND.

HIS Excellency Lord Pentland who has just assumed office as Governor of Madras was until recently well-known as the Right Honorable John Sinclair. Born in 1860, the son of John Capt George Sinclair, and grandson of the late Sir Sinclair, Bart., he received his education first at the Edinburgh Academy and then at Wellington and Sandhurst. He entered the Army in 1879 and served with distinction in the Soudan Expedition in 1885 (Medal and Clasp). In the following year, he served as A.D.C. to Lord Aberdeen, the Lord Lieut. of Ireland, whose only daughter Lady Marjorie Gordon, he later married. While serving in this capacity, he appears to have first imbibed a taste for work in the Civil Department of the State. He contested as a Gladstonian Liberal, in 1886, the Ayr Burghs but was unsuccessful. In 1887 he retired from the Army with the rank of Captain. He was selected a member of the London County Council in 1889 and during the next three years he did good work on it. In 1892 he was elected member for Dumbartonshire, for which he sat until 1895. During these three years he evinced interest mainly in Scottish matters and only once spoke on Indian affairs. Throughout the Session he showed that he possessed considerable tact and judgment and though a Radical he showed himself ever anxious to know the other side of a question he was debating. In 1895, he was defeated by Mr. A. Wylie, the Conservative candidate, and he chose for a time to give up politics for a congenial office in Canada, and in that capacity during the next two years saw something of colonial life in America. He returned to Scotland in 1897 and was returned to Parliament by Forfarshire the same year. His constituents came to appreciate his qualities of head and heart, and retained

him as their representative until his elevation to the Peerage in 1909. He first became Secretary for Scotland in 1905, on the formation of a Liberal Ministry by the late Sir Henry Campbell-Bannerman in that year. He first made his mark as Liberal member for Dumbartonshire between 1892-1896 by his pointed criticism, and moderate views and became greatly popular with his constituents by the constant endeavour to serve them in Parliament.

In 1894, while yet member for Dumbartonshire, Lord Pentland carried an important amendment to the Lord's Amendment to the Sea Fisheries Regulation (Scotland) Bill, and his experience in that piece of Legislation ought to stand him in good stead in Madras, where, for some time past, much money and time has been spent on Fisheries Investigation work. Everybody in Madras as in Scotland is interested in the fishing industry and they are likely under the new Governor, to get "a scheme which their reason could assent to," to quote the words, he used in commending his amendment to the House. He also took part in 1894, in the debate on the Local Government (Scotland) Bill, and the Bill as it was eventually passed owed not a little to his amendments, many of which were accepted by Mr J. B. Balfour, then Lord Advocate for Scotland. In the following year, he took part in the debate on the Indian Cotton Import Duties question, first raised by the late Lord James of Hereford. Lord James rose on 21st February, 1895, to move the adjournment of the House for the purpose of discussing the recent imposition of duties on the importation of cotton manufactures into India. That was rather an important occasion for the constituency represented by Lord Pentland, who spoke in favour of Scottish dyers who were large exporters to India and Burma of goods which would be affected by the new Import and Tariff Act. While he rightly asked for "equal justice

between them and the Indian dyers," he agreed that it was "necessary to take a wide view of the subject." He reminded the House that they might with advantage remember one point in connection with the discussion on hand, and that was "that this Import Duty had been decided upon and established on the initiative of the Legislative Council. That brought them to the further consideration in which they must all acquiesce that, as the Legislative Council was the organ of the British authority in India, it would be a very serious thing to deal any blow to that authority, and it would not be a matter in which those who sat on his side of the House could, as Radicals, find anything congenial to the principles in other respects." He got Sir Henry Fowler (afterwards Lord Wolverhampton), then Secretary of State for India, to receive a deputation on the subject for the discussion of the points involved and renew a promise from the Government that they would deprive the new duties of all protective character. In 1896-7, he was Secretary to Lord Aberdeen, when Governor-General of Canada. He was appointed Liberal Whip for Scotland in 1900 and five years later was made Secretary for Scotland. In 1907, he had charge of the Scottish land bills, and in that capacity did much good for Scotland. This land policy has counted for much in the support given to Liberal Administration in Scotland since and last year in a modified form representing a compromise the bill was placed upon the Statute book. In the early days of the movement, Lord Pentland did much spare work in educating Liberal opinion in Scotland in this direction and at his initiation deputations of farmers visited Denmark, Canada, and Australia and drew up reports which were of value to the organisers. The land policy then inaugurated contained a germ of the Government's land policy in a wider sphere. The present Premier Mr. Asquith also expressed the same view of his services for Scotland when presiding at the Scottish

complimentary dinner some months ago. He coupled his name with that of Robert Burns and said that as an Ayrshireman he would go down to history. "Lord Pentland's name," he added, "would always be mentioned in Scotland in association with the passing of the Land Bill." The office included that of the Keeper of the Government Seal of the Principality of Scotland and recently the Vice-presidency of the Committee of Council on Education in Scotland. Lord Pentland's great interest in education was largely responsible for the Scottish Education Act of 1908. This Act made attendance in evening schools in Scotland compulsory up to the age of 17 and it has been described as rich in promise and possibilities. The Scottish Educational Institute recognised his services in this connection by the conferring on the eve of his departure of an Honorary Fellowship on him. In him Education in this presidency ought to find a true friend. Lord Pentland married in 1904 Lady Marjorie Gordon, the only daughter of the seventh Earl of Aberdeen and has a son and a daughter, the former of whom is about five years of age. He is only 52 years now, and possessing as he does both administrative experience and practical knowledge of foreign countries he ought to make a successful Governor of Madras.

Poetry and Life Series. (*George Harrap*).

Scott & His Poetry by A. E. Morgan *Mrs. Brown- ing and Her Poetry* by Kathelyne E. Royds.

In reviewing the earlier volumes of the series we drew attention to the points of excellence which render them eminently suggestive and useful. The brochures under review maintain the same high standard and the student of poetry has the privilege of studying two more poets in intimate relation to their work. The selections from Scott have been made with taste and discrimination indeed.

THE WORLD OF BOOKS.

[Short Notices only appear in this section.]

Human Affection and Divine Love. *By Swami Abhedananda, Published by the Vedanta Society, New York.*

The power of Divine Love to cleanse the Soul of all its imperfections is well set out in this brief essay of Swami Abhedananda, of the Ramakrishna Mission. 'Divine Love brings a cessation of all sorrow, suffering, and pain. It lifts the soul above all bondage, breaks the fetters of self-attachment and worldliness. Divine Love seeks no return. A true lover of God loves everything of the world. He does not see good or evil.' 'The soul of a Bhakta becomes intoxicated with Divine Love.' 'A true lover of God does not care for Salvation. His constant prayer is: 'O Lord, wherever I wander, may I always have undying love and ever-lasting devotion to Thee.' These extracts, it may be said, contain the kernel of the Hindu Religion. All else, however acutely intelligent, is but matter for wrangling.

Personal Magnetism and Occultism. *By M. Gnana-prakasam Pillai. Srinivasa Varadachari & Co., Madras.*

This is a valuable book of sound practical directions for the use of those who wish to acquire occult powers like mesmerism, will control, etc. Detailed rules are given as to Yoga practices like the prana-yama, dharana, samadhi, and so on. The author claims, in common with the New Thought School, the possibility of acquiring Magnetic control of other minds by developing the powers of magnetic gaze, touch, and auto suggestion. The book is not merely interesting reading, but is clearly meant to be used as a text-book of practical instruction in the matters dealt with in it. It is neatly got up by Messrs. Srinivasa Varadachari and Co., and is priced Rs. 15, apparently to show its invaluable nature.

My Own Story *By the Ex-Crown Princess of Saxony (George Bell & Sons 9s)*

The romantic career of the Ex Crown Princess of Saxony has excited an interest and enthusiasm to which there would hardly seem to be a parallel in the history of modern social life. The most malicious representations of her life have been offered to the world and her name has had to stand persistent calumny. In this account of her own life Princess Louisa has effectively vindicated her character and the world has now been given an opportunity of extending its genuine sympathy to this injured queen and suffering wife.

The memoirs derive an additional value by displaying an interest beyond that of a mere successful defence. It is a touching account of a woman's misfortune, and its appeal to our feelings is so sincere that Carlyle should have had no hesitation in calling it "a human book." She is the maligned mother writing of her children, "I never see a fruit laden cherry tree without thinking of those bygone summers when the children and I used to go into the orchard to pick the cherries. I climbed a ladder and threw down the scarlet fruit to the dear little expectant hands. Oh happy days spent with my loved ones, vanished now for ever! The summer always has regrets for me; the smell of the hay, the scent of roses, the long drowsy days and the warm still nights all stab me with the memories which I shall carry with me to the grave."

The genuine ring of the following declaration must silence the tongue of cruel scandal—"The Hapsburgs have always been accounted light livers and light lovers, but I had never had any inclination to emulate my forbears."

Many a volume of autobiographical reminiscences is marked by an offensive egotism, but the reader of MY OWN STORY is only in love with the girlish pride and innocent jubilation of Louisa. She admires herself in a new gown, is proud of Kaiser's appreciation of her charms and does not

mind telling us that her husband was envied for possessing such a beautiful wife.

It is not merely in these virtues of grace and feeling that the volume bears its claim for wide interest. There is a powerful insight into life and character and the following account of the Kaiser is only one of the numerous portraits presented by her: "I found the Emperor William a most remarkable man. He can be very genial but he possesses an iron and inflexible will. He is vain and always wishes to be the first actor in whichever drama he plays, and although he is an undoubted authority on military matters, he understands little or nothing about art or music and his wonderful gifts are marred by his intense egotism. He can be equally charming or the reverse, and the reverse is not at all pleasant. His personal appearance is unique, he is well groomed, his expression is sympathetic and intelligent and his marvellous eyes are truly the windows of the soul of this restless, brilliant and strange man."

It is hoped enough has been said to show that the book deserves a warm welcome on its literary merits as well as the touching interest that must be roused in any person of human sympathies by an account of her life of suffering and sorrow.

Urge Divine *By Mr Sant Nihal Singh, Messrs. Gurnesh & Co, Publishers, Madras, Price Rs. 1.*

The essays comprised in this volume are varied in character. They relate to agricultural, industrial, educational, philanthropic and personal topics. There is none of them which does not point a valuable moral for India. In modernising herself India has necessarily to profit by the experience of other countries. Even where the form cannot be reproduced the method is bound to be instructive. And the present essays, containing as they do the observations of an intelligent Indian, who wields a facile pen and has travelled through many lands, are full of rare and useful information and are calculated to serve the object the author has avowedly in view—the uplifting of this ancient land.

Lady Windermere's Fan. *By Oscar Wilde*
(Methuen & Co, Ltd, 1s. net)

Messrs Methuen & Co. have issued a cheap and pretty shilling edition of Oscar Wilde's "Lady Windermere's Fan." It is a vivacious drama of dialogue in the drawing-room. It has all the sharp genius of Wilde with his philosophy of the superficial and total neglect of the vital forces of humanity. As in all his plays, there is no effort to satisfy the time-honored sense of poetic justice. Strange happenings seem to be indispensable to the art of Wilde. A forgetful nurse consigns a baby to a portmanteau in his 'Importance of being Earnest.' And in 'Lady Windermere's Fan' we cannot understand how Lord Windermere, such a good husband that he was, should render his friendly services to Mrs. Erlynne in circumstances so offensive to his wife. But we should not have the play but for this irreconcilable conduct on his part. Wilde's plays have the characteristic of exciting alternately delight and keen sense of discrepancy and the stimulating dialogue is bound to please even the morose student. Messrs. Methuen and Co must be thanked for placing this masterpiece within the easy reach of students of Literature.

The Philosophy of Religion. *By Knox. Published by The Christian Literature Society for India.*

The learned doctor here points out how "religion is an instinctive reaction of man to his environment" and how 'the progressive history of religion' is the ascent from lower to higher views of Him whom we adore and in whom we trust. The primary religious feelings in man are evoked by the glory of the universe and he slowly rises to the perception of the glories of inner heaven. The author closes his examination of religion with an exposition of the beauties of Christianity.

Inorganic Chemistry. *By E. C. C. Baly, F.R.S. T. C. and E. C. Jack, London.*

Mr. Baly does not overburden the reader with a mass of detail about substances, but is content with laying great stress on the fundamental principles or laws of Inorganic Chemistry. The general reader can also get some idea of chemical analysis, rarely treated in such books. But strange to say, the modern 'ionic theory' gets only a passing remark from the author.

Medical and Surgical Science: Its Conception and Progress: *by S. Hillier, M.D.*
(Published by Milner & Co., Halifax).

This book gives a succinct and clear account of the progress of European Medical and Surgical science from the early Grecian to modern times. The contribution of the Hindus to medicine and surgery is summarily discussed in a short paragraph of six lines. It is perhaps the best thing that Dr. Hillier could have done seeing that he is unacquainted with the subject. Up to the 18th century, medicine and surgery did not deserve the name of sciences and their practice was chiefly in the hands of charlatans. The names of William and John Hunter stand pre eminent in the history of medicine. Both of them were accomplished Anatomists and the work of the latter was of such signal value that immense progress was made in medicine and collateral sciences. The 18th century was also famous for producing Edward Jenner who discovered vaccination against small-pox and robbed this disease of most of its horrors. The 19th century, however, witnessed more progress than all the preceding ages since the earliest historical times. To justify this statement, it is enough to mention the immortal names of Simpson, Pasteur and Lister, each of whom has left his mark on that memorable century. The story of the introduction of chloroform, the discovery of pathogenic bacteria and their applications to operative surgery, forms a fascinating reading. We have no hesitation in saying that this excellent book should be in the hands of every educated man.

The Religion of the Iranian Peoples. By G. K. Nariman, Published by "The Parsi" Publishing Co., Bombay

This book is a translation of Tiele's book on the religion of the Iranian peoples. He proves how the earliest period of the later Avesta is not later than 500 B. C. He inclines to the view that the Indian and the Iranian religions sprang up after the separation of the two branches of the Indo-Iranian race. He rejects the view that the Iranian faith was influenced by Semitism. Zoroastrianism is a sharply defined dualism. Its ethical code is strict and noble. The book is full of interesting matter and deserves careful study.

Macbeth. Edited by S. E. Goggin, M.A., (University Tutorial Press, 1s. 6d.)

Mr. Goggin's edition of *Macbeth* comes up to the high standard of the other volumes in the series. There is a treatment of almost all the questions concerning Shakespeare's research in relation to the play of *Macbeth*. The introduction is particularly valuable and the account of the sources of the play is another useful aspect of the edition.

The Boy Wanted. By Nixon Waterman and Fred. E. Bumby, B. A.

The Girl Wanted. By Nixon Waterman and Grace Batrass. George G. Harrap & Company, London.

These are companion volumes containing friendly thoughts and counsel for boys and girls respectively. They contain practical talks telling boys and girls how they can mould their temperaments and shape their characters. The authors do not arrogate any "superior" attitude in presenting their counsel. Each volume contains sixteen portraits of great men and women respectively, together with short sketches of their lives. The quotations on the margin will recall many a pleasant memory to elderly readers. Both boys and girls will be glad to have read them and will be "the better, the sweeter, the happier for doing so."

Diary of the Month, Oct.—November 1912.

—o.—

October 21. At a meeting held at Calcutta to day it was resolved to collect fresh subscriptions for the Red Cross Society in connection with the war. Great enthusiasm prevailed and a large amount was collected.

October 22. Mr. E. B. Havell lecturing before the East India Association to day on "The New Delhi" put in a strong plea for an oriental style of architecture. Sir George Birdwood declared that the Delhi proclamation was a stroke of genius, the supreme touch of imagination.

October 23. It is understood that Sir James Mason has consented to receive an address at Allahabad from the U. P. Congress Committee.

October 24. To day a strong and representative committee of forty members was formed at Rangoon to collect funds for taking further action in the matter of the sentence on Mr. Arnold of the "Burma Critic."

October 25. Lord and Lady Pentland, their two children and party arrived at Colombo this night, and stay with H. E. the Governor of the island.

October 26. The Punjab University has obtained the sanction of the Government for the appropriation of Durbar Educational Grants.

October 27. Lord and Lady Pentland arrived at Madras this morning and the former took charge of his high office as Governor of the province with the usual salutes.

October 28. To day the Hon. Mr. Gokhale was welcomed at Johannesburg by the Mayor and many citizens. Several addresses were presented to him by various public bodies.

October 29. An important Mohamadan Association of Lahore has passed a resolution praying the Government to issue standing orders granting all Muslim Government servants two hours leave every Friday afternoon.

October 30. Sir Charles Bailey received and replied to an address to-day at Gya in which the hope was expressed that a High Court and a University would be established in Behar and Orissa.

October 31. This morning, before the Chief Presidency Magistrate of Bombay Mr A J Buckle, lately of the *Madras Times*, declared himself the printer and publisher of the new daily paper, the *Bombay Chronicle*, to be issued in Bombay by a Syndicate headed by Sir Pheroze-shah Mehta.

November 1. Mr. Gokhale was to-day entertained at a public banquet at Johannesburg. He explained the purpose and scope of his Mission to South Africa.

November 2. The death is reported from cholera of Mr. C. V. Miles, a keen and able journalist who has long been connected with the *Advocate of India*.

November 3. A public meeting of Hindus and Mahomedans was held at Beaden Square, Calcutta, this evening with Mr. B. C. Pal in the chair at which the boycott of foreign goods was urged.

November 4. A press *Communique* from Simla states that the Secretary of State for India has approved the recommendations of the Government of India regarding the reconstitution of the Bengal Council and the new Council for Behar, Orissa and Assam.

November 5. The Hon. Mr. E S Montagu is having a pleasant time of his day at Srinagar. Informal visits were exchanged between H. H. the Mah rajah and Mr. Montagu.

November 6. It is announced that Dr. Woodrow Wilson has been elected President of the U. S. A. and has had a prodigious record vote in his favour.

November 7. The *Daily Mail* says that Sir Frederick Ponsonby has been selected to succeed H. E. Sir G. Clarke as Governor of Bombay.

November 8. At Petermaritzburg to-day Mr. Gokhale addressed a crowded Indian meeting when he urged for equality of treatment for his countrymen. The administrator presided and handed over the people's basket containing the address.

November 9. It is understood that the 5th Provincial Conference of Co-operative societies will be held at Calcutta, opened by H. E. the Governor and presided over by the Hon. Mr. P. C. Lyen.

November 10. Mr. Asquith delivered one of the most weighty and statesmanlike speech on the Balkan war at the Guildhall address.

November 11. In House of Lords to-day Lord Curzon raised the question of the Hastings House in Calcutta. He protested against the idea of parting with the House and of transferring its furniture to Delhi.

November 12. Speaking at a Banquet given in his honour at Durban Mr. Gokhale denied that the uttered veiled threats or suggested Imperial intervention.

November 13. In the House of Commons to-night there was unprecedented rowdiness which ended in the abrupt dissolution of the sitting amidst a chaos of disorder and howling.

November 14. A farewell address was this evening presented to H. E. Sir George Clarke by the President and members of the Poona Municipality.

At a Meeting of the Mahomedans held this afternoon at Calcutta under the presidency of the of the Hon'ble Mr. Ariff, the following Resolution was adopted:—"That the Guildhall speech of Mr. Asquith, Premier of England, as far as it relates to Turkish affairs, has greatly wounded the feelings of the Mahomedan subjects of His Britannic Majesty and has created a profound sense of disappointment.

November 15. The Hon'ble Mr. Gokhale had an interview to-day at Pretoria, with General Botha, General Smuts and Mr. Fischer, lasting

two hours. Mr. Gokhale declared afterwards that he was quite satisfied with the frank and full interchange of views on the position of Indians in South Africa. He was certain that both sides appreciated the Indian and European standpoints.

Lieutenant Colonel Sir David Barr has been appointed Chairman of Political Committee of the India Office, in succession to Sir William Lee Warner, retired.

Mr. Montagu visited the Government, D. A. V. and Forman Christian Colleges, Lahore, this morning, accompanied by the Rev. Dr. Ewing, Vice-Chancellor of the University.

November 16. The Revised Regulations for the Imperial Legislative Council have been gazetted to day. The number of elected Members has been increased from twenty-five to twenty-seven, and the nominated Members reduced from thirty-five to thirty-three, of which not more than twenty-eight may be officials and three shall be non-official persons, to be elected from (1) the Indian commercial community, (2) the Mahomedan community in the Punjab and (3) the landholders in the Punjab.

November 17. The Ambassadors and Commanders of Squadrons decided to land forces at Constantinople at 5 o'clock in the morning. They will remain concealed in buildings in various quarters of the city till they are required.

November 18. An association formed of numerous chiefs and dignitaries who have recently arrived in Peking has issued a statement denouncing the declaration of independence of Mongolia by the Hutukhta of Urga, and disavowing the Treaty with Russia, and declaring that it is impossible for a rebel community representing less than one-tenth of Mongolia to arrogate to itself the right of deciding the political fate of Mongolia.

The Cape Times (South Africa) thinks that Mr. Gokhale's visit has sown the seeds of much practical good. The most important aspect of the problem from the imperial point of view, the

paper says, concerns immigration, on which question there is now substantial agreement that British India will be excluded from South Africa. The Immigration Act should not discriminate against British Indians, but exclusion will be affected by administrative means, which will be rigorously applied. It is most probable that the £3 tax in Natal on indentured labourers desiring to settle will be repealed at an early date.

November 19. Reuter wires from Lourenço Marques —

"After strenuous and splendid tour and after interviewing Ministers and Lord Gladstone and having been accorded magnificent receptions everywhere from Europeans and Indians alike the Hon. Mr. Gokhale left Johannesburg by steamer "Kronprinz" for India. The Indians are most grateful to him for his noble services. The visit has been most useful and we hope that India will continue the work commenced by the Hon. Mr. Gokhale and help us."

November 20. Mr. Harold Baker, replying to Colonel Yate in the House of Commons to day stated that Sir Steynning Edgeley, Sir Felix Schuster, Sir Theodore Morison, Sir Krishna Gupta and Mr. Laurence Currie voted for the grant which it was proposed to make to Mr. Montagu to defray his travelling expenses in India. Sir William Lee Warner, Sir J. Digges La Touche, Sir James Thomson, and Sir Thomas Raleigh were against the proposal.

November 21. Mr. Asquith, replying to Mr. Fell in the House of Commons to day, said that it would be within the competence of the Government of India or the India Office to raise the question of an offer of *Dreadnoughts* by India, though a definite offer could not be made without the approval of the Secretary of State. The question had not been raised. He understood that the view of the Indian authorities was that India's share on the scheme of the defence expenses of the Empire was on a sufficiently high scale, and, if possible, should not be increased.

Current Events.

BY RAJDUARI.

THE ARMAGEDDON OF THE CENTURY

THE eyes of the world were, of course, eagerly turned to the war between the Ottoman and the allied Balkan States during the last four weeks. Many stirring events have occurred during this interval which have astonished the military world which on the whole were sceptic about the Allies doing any serious harm to the military prestige of Turkey so remarkable in Eastern Europe during the last half a century and more. But, they say, war is a game of chance. Despite military resources, despite the able strategy and leadership, and despite the big battalions, it has happened before that a belligerent state has been worsted in the field by its adversary, every way inferior in the sinews of war and "the resources of civilisation." Not to go back, we have only to recognise the defeat or blow to the military prestige of such a colossal military European Power as Russia four short years ago in her war with Japan. That indeed was an untoward event altogether. When the clangour of arms and the thunders of artillery were active in the Chinese Peninsula, nobody undreamt of the utter defeat by land and sea which Japan gave to Russia, raising herself to the rank of a first class Power and lowering the military prestige of her mighty adversary. Who ever dreamt of their triumphs when the allied Balkan States first began war seven weeks ago, even without waiting for the Great Powers who desired to give them the counsel of perfection? At the time it was generally deemed a rash and precipitate movement on their part to try conclusions with a Power whose military prestige was so well established at Plevna and Shipka Pass! But the battle of Freedom, the battle of Emancipation from the tyranny, more or less, of an Ottoman, had been resolutely and secretly determined upon. Yes, so secretly that the most well informed diplomatic chancelleries on the Continent had not even the vaguest hint of that determination once for all to fight for the cause of freedom, to die or win. The hardy mountaineers of Montenegro were as much consumed by a desire to be free from Turkish yoke as Bulgaria. The Serbs equally panted for securing autonomy. Desperation has often driven small States to band together for a common object,

come what may. Growing under intolerable tyranny of years, it is only natural that our common humanity under such a condition should cast the last stake. "Let the die be cast"—That was the secret password of the allied States struggling for common Freedom "Return," as the mothers of the stern Spartans of old used to say when bidding farewell to their brave sons going to fight in the country's cause, "return with the shield or die with the shield." that indeed was the courageous password with the Allies.

So the Allies began their final war of emancipation against the Ottoman. They braved it all and so far as Thrace and Macedonia are concerned they have astonished the world and evoked unanimous praise for the bravery, aye, the bloody fierceness, with which they have fought and conquered those provinces Montenegro, Servia and Bulgaria proceeded to their respective warlike campaigns with a deliberate purpose and a well calculated plan which has admirably succeeded. Imagine these "small neighbours" as the haughty Turk, proud in his own military strength, observed, with very little of the resources of war, with no financial support from any of the Powers, with a soldiery accustomed only to pastoral or agricultural pursuits, imagine such a conglomeration of elements daring a mighty foe, overrunning his country and almost knocking at the gates of Constantinople within six weeks of their combined invasion! They have fought only as heroes of old fought, oftener hand to hand, creating a carnage which from the point of humanity is indeed most shocking and unexpected in our civilised modern warfare. It was an unexpected stroke of military victory which is bound to be recorded in the pages of impartial History as almost unprecedented.

As we write, no doubt, the further onward march of the fighting Bulgarian has been greatly arrested. Adrianople, though besieged has not fallen, and is not likely to fall according to all military experts. Neither had the Bulgarian been able to force the serious array and bold phalanx of the Ottoman army at Tchaldj which is within a few miles of the capital. Evidently the Turks this time have been severely defeated. But the defeat owes its origin to the Turks' own internal dissensions in the first place, and in the second place to rampant inefficiency of the Army itself. It cannot be that the Porte had not become aware of the bellicose attitude and movements of the Allies. But it was so woefully provisioned, and otherwise, so inefficiently drilled that it does

nomy for the province prove a guarantee to the future security and peace of Austria and Italy on one side and Bulgaria and Servia on the other? What may be the compensation which Roumania may demand? And how may Russia digest the terms of peace when finally ratified, if ratified at all? All these are grave problems hanging in the balance. A few days or even a few hours may inform the world of their fate. Meanwhile the horizon of Europe must be deemed dismal. It is surcharged with electricity which may burst into a conflagration any moment. There is, however, this element in favour of Continental Peace, that no Power singly by itself can venture to go to war to satisfy its own territorial or even economic ambition. War is too horrid and means expenditure of millions which no Continental people can afford, seeing how weighted they are already by the burdens on account of the cost of arms and armaments of an intolerable character. *Peace, on the modern acceptance of the term, only means standing preparations for War.* So let us wait for the events now about to transpire, when we shall be in a better position to survey the new field of European politics which will open to our vista. We shall be able then to learn what part Great Britain will take in it. Indian Mahomedans seem to have indulged in very phantastic notions about England's duty towards Turkey. What is most amusing is the long litany chanted at every mosque, at every league, at every association and at every conference, on the subject without ever having cared to understand England's relations with Turkey for well nigh a century. Again, it argues a want of a knowledge of English constitutional history to make the kinds of hollow appeals now in vogue to the Ministry at home to intervene in the way that they desire, because Great Britain is the most important Mahomedan power in the world! We can understand their feelings which during the Russo-Turkish War were almost non-existent. Education has given a kind of political colour to these feelings at the present hour. But our Mahomedan friends, it must be ruefully acknowledged, are yet vastly behind in political education and therefore hardly able to understand even the A, B, C of the foreign policy of the British towards Turkey. Their appeal is natural, but they seem to be sadly wanting in the vision of perspective and proportion.

HOME RULE AND UNIONIST FANATICISM.

The Mother of Parliaments has sometimes a domestic brawl at home, as, in her very hall where she forges legislation for the weal or woe of her

dearest children. British Parliament for many a year has hardly presented a scene of the character which was painfully discernible one hot day a fortnight ago. The battle of Home Rule in Committee is carried on by the two great parties in the State with a spirit which is hardly conducive to a satisfactory solution of the long pending problem. No doubt Home Rule this time seems nearer in sight than it ever was since its first introduction into the House of Commons in 1885. That very fact has incensed those who are against it. Some of the party have taken to the Bill mildly, while some have been sitting astride on the fence. But there is a third faction which is nothing if not obstructive and obstreperous. It breathes brimstone and fire and gasps for breath. It wants to be in office, and is on the look out for the smallest occasion to give what it fancies a defeat which should compel their adversaries to go out. Since the Ulster rebellion raised by Sir Edward Carson and his hallow sounding band of covenanters, this faction has vowed mortal combat in the committee. But all along they were exceedingly vexed that every amendment put forward had met with rejection by a thumping majority of 100. That fact was gall and wormwood. But as the Fates would have it, one unlucky day, when the Ministerial Whips were more or less lax in their vigilance the militants on the other side got their long looked for chance which they had been wistfully waiting for. On the amendment of a financial clause the votes went astray. The sober majority of 100 was converted into a minority of 28. That indeed was a grave Ministerial blunder. The Whips were caught napping and here was the untoward result. Curiously enough the Prime Minister thought he had the constitutional right of causing the vote to be rescinded. Judging from subsequent events and the impartial utterances of the Speaker, it seemed that for once the shrewd common sense of Mr. Asquith had left him awhile. In trying to have the amendment rescinded he counted without the limits of his host of adversaries. He knew of their opposition but he had not the faintest conception of its noisy magnitude and the volley of abuses he was to meet with. As is sometimes the case, the untoward happened. The suggestion of rescension infuriated the intransigents of the Unionists. And immediately the fat was in the fire which for a few minutes burnt with a fury even unexceptional for so sober and sedate a parliament as that of England's. However when men's passions are excited,

the "verities," as Carlyle calls them, have unlimited sway. So for a time the ball of St. Stephen was a regular pandemonium besides a perfect babel of tongues on which nothing but the most un-English terms were freely indulged. The Speaker, like the grave Nestor of old, did his best to stem the tide of indignation and vilest disorder. But the intraguents were bated not a jot. So it was deemed wise to allow all the electric fluid to discharge itself. So the House was adjourned for an hour which was the wisest move. Vesuvius had time to cool down, after the mass of molten lava it had thrown out. When the House reassembled the Speaker observed that there was a way out of the difficulty which he would point out when the House would re-assemble after the week end, and so, on the opening of the House again a *no media* was pointed out which was perfectly constitutional and accepted by all parties, the Premier giving his most willing assent. Things have gone on smoothly since the occurrence. But it may be yet premature to say whether the Bill will pass through the Commons. At any rate it will hardly have the assent of the other House and so for the time it will be relegated to be re-introduced the next Session.

Meanwhile it appears that there still continues the opposition of the incontinent section of the medical men to Mr. Lloyd George's Insurance Act, now in full operation. But the Chancellor of the Exchequer is not a jot discouraged at this continued opposition which is partly for political purposes only, namely, to excite the passions of the ignorant and uneducated mob against insurance which in reality most benefits them. The Unionists of the real type are behind the movement the object of which is to make the Insurance Act odious in the eyes of the electors and turn the scales of Government in their favour. Be that as it may, Mr. Lloyd George is now fortifying himself by seeking the support of at least 100 strong Insurances who are prepared with their own agency to assist him in carrying out the Act.

The Foreign Office, meanwhile, is now the target of all honest and independent critics who see in the line of policy adopted by the obstinate Sir Edward Grey a grave menace and danger to the best interests of England in the near future. The policy pursued by that Minister towards Persia, towards the Chinese loan, and other matters continues to be vigorously attacked. So, too, the absurd length to which he has gone on with Russia under the cover of the *Entente*. It seems

all England's eyes see through the wiles and artifices of Russia save Sir Edward and his adherents and apologists. A whole-hearted and well-organised vote of censure is now demanded for this erring Minister who is sending England to the dogs in politics.

CONTINENT.

The Continent is on the brink of a huge volcano. It all depends on the way in which the Balkan Allies behave, whether next spring a big European war breaks out or not. The chances, so far as events have occurred, are against it. But there is no saying what one day may bring forth. The world is more and more for the arts of peace rather than those of war, albeit that capitalists are busier than ever forging the weapons to place in the hands of the dogs of war.

It is a sad story once more—the wanton assassination of the true benefactors of their country. The latest victim to anarchic or mad passion is the great Senior Canalejas, the Premier of Spain, a profound statesman and a strong one who had ruled the country for over two years with consummate ability during a most eventful period in Spanish annals. It is most sad that patriots of the sterling character of Senior Canalejas should fall a victim to senseless fanaticism—and yet Europe says she is "civilised" and never is backward to denounce "the barbarous" East!

Austria has been very reticent and restrained of late which we owe to the efforts of the aged Emperor who is sincerely anxious to close his days in peace. But we cannot say what may happen within the next few days and what we may have to chronicle on continental politics in our next number.

THE DEPRESSED CLASSES—A Symposium by His Highness the Gaekwar of Baroda, Mrs. Annie Besant, Mr. Gokhale and others. Price One Rupee. To Subscribers Rs. 12.

SRI SANKARACHARYA'S SELECT WORKS—The Text in Sanskrit, Devanagari type and an English Translation. By S. Venkataramanan. B. A. Price Rs. 1-8. To Subscribers of the "Indian Review," Rs. 1.

INDUSTRIAL INDIA—By Glen Bailow, M.A. Second Edition. Rs. 1. To Subscribers of the "Indian Review," Rs. 12.

LIFT-IRRIGATION—By Alfred Chatterton. B. Sc. C. I. E. Second Edition Revised and enlarged. Price Rs. 1. **Essays in National Idealism**, by Dr. Ananda K. Coomaraswami, with 6 illustrations. Rs. One. To Subscribers, Rs. 12.

G. A. Natesan & Co., Sunkorama Chetty Street, Madras.

TOPICS FROM PERIODICALS.

Higher Education in India

The place of honour in the current number of *The Modern Review* is given to an illuminating article on "Higher Education in India" by Professor Homersham Cox, M.A. He begins by discussing the differences between the methods of the European and the Indian Universities. Regarding the common fad for an English degree for Indian youths he says:—

After all, learning is a matter of time, and there are no magical devices by which a young man of twenty may be made a profound scholar. Even up to the M Sc degree, a student can, I think, learn as much in India as in Europe. I am speaking of technical knowledge and in especial of mathematics; of course, from the point of view of general culture it is always an advantage to visit foreign countries. For more advanced studies, however, the best Indians will derive great benefit from going to Europe, where they will be able to hear the most eminent teachers. But it is only the best who will be able to profit from the lectures of these teachers, the average or even the fairly good student can learn just as much in India. It is necessary to insist on this point, because a superstitious value is sometimes attached in India to a European degree. In reality, however, the Indian who goes to England and takes third-class honours in Oxford or Cambridge is no better than, perhaps not nearly so good, as the Indian who has taken his degree in his own country. It is not worth while for an Indian to go to an English university merely to take a pass or low honours' degree, except, as I have said, for the sake of general culture.

The writer next turns to the question of religious education. He is against the advocacy of religious instruction in colleges and says that one might as reasonably complain that a laboratory is not a temple or a mosque. He says that for all practical purposes Indians are religious enough and they receive religious instruction from other quarters. He is almost violent on the point and observes:—

Although most Indians do not go to school they receive instruction in religion none the less. This instruction is given for the most part in the home as it ought to be. Indeed a great deal of Hinduism can only be taught in the home, since the family worship is kept secret. Besides the home teaching, Hindus from time to time listen to a *Kutub* and Mussulmans at the celebration of the *maulud* to a sermon.

To complain of the absence of religious instruction from colleges is about as silly as to complain of its absence from the Allahabad Exhibition.

The fault is not in the neglect of religious education nor even in the want of moral instructions. The real defect of Indian universities is that so few of the students read to a high standard. It is not their fault altogether. A young man as a rule has to look forward to earning his own living and cannot afford to spend his years in study which lead to nothing. For the attainment of real scholarship, therefore, the heads of colleges and professors must be awarded a more handsome pay inasmuch as popular esteem in India is in proportion to their remuneration. A school master is seldom given the same respect as a Government official. This reproach must first be cancelled: and rich men should found professorship for Indians. Above all, the universities must stand above the whims of a civilian and the position of a professor must in no way be less than that of a Government official. The writer then suggests:—

It would be better to found a single university in Delhi or in some place under the Bombay, Madras or Bengal governments. An Anglo-Indian Lieutenant-Governor who has been for thirty years a member of the Indian Civil Service cannot be expected to have so much sympathy with education as a statesman who has recently come from England. Lastly if a new Indian university is ever to develop into anything better than the existing ones, it must have the internal freedom of European universities. The control must be no meddling of outsiders, whether Indian lawyers or Anglo-Indian officials.

The mistake into which the Aligarh and other colleges have fallen is that they have servilely followed the English system. If the Indian Universities are to be a real power for good in India they must be based on the latest development of the German and American centres of learning.

The writer sums up as follows:—

The assertion that religion needs to be taught in Indian colleges is a mere foolish parrot cry repeated by those who do not know the facts or do not take the trouble to think. Indian students are not deficient in religion and morality, as compared with the students of other countries. The real defect is that so few of them pursue their studies far enough to become scholars. This will only be remedied when scholarship in India is adequately rewarded.

The Origin of Life.

Sir Oliver Lodge has a very interesting and lucid article on the problem of the origin of life in the *Contemporary Review*. The business of a biologist, he says, is to study the phenomena exhibited by matter under the influence of life. It is not his business to know what matter is, or to know what life is, nor even to understand the way in which one interacts with the other. He then speaks of the limitations of our power.

All that the experimenter will have done will have been to place certain things together—to submit, for instance, chemical compounds to certain influences. If life results, it will be because of the properties of those materials, and of the laws of interaction of life and matter, just as truly as when a seed is put into the ground. It will be a step beyond that, truly, but it will be a step not of a wholly dissimilar kind. The nature of life will not be more known than before.

He then relates the position clearly —

The position may be stated thus — Life has undoubtedly originated on this planet somehow. There was a time when the whole earth was molten, and purely inorganic—many millions years ago certainly, perhaps a thousand million years ago. Common observation shows that its surface is flooded with organic life now. Terrestrial life originated in ways unknown, and at times unknown it may have entered into relation with matter gradually, and solely in the past, it may perhaps be incarnating itself likewise, here and now, but, so far, the process has never been observed.

He then turns to the theological bearing of the whole discussion.

Life in its ultimate elements and on its material side is such a simple thing, it is but a slight extension of known chemical and physical forces, the cell must be able to respond to stimuli, to assimilate outside materials, and to subdivide, though the origin of protoplasmic activity itself as yet eludes the laboratory workers. But will the theologians triumph in that admission? Will he therein detect at last a dam which shall stem the torrent of scepticism? Will he have an argument for the direct action of the Deity in mundane affairs on that failure, and entrench himself behind that present incompetence of labouring men? If so, he takes his stand on what may prove a yielding foundation.

Sir Oliver concludes in these words. —

In an early stage of civilisation it may have been supposed that flame only proceeded from antecedent flame, but the tinder-box and the lucifer match were invented nevertheless. Theologians have probably learnt by this time that their central tenets should not be founded, even partially, upon necessece, or upon negations of any kind, lest the placid progress of positive knowledge should once more undermine their position, and another recovery have to be sought with alarmed and violent pathos."

The Dravidian Temple Architecture.

Mr R. L. Ewing, M.A., writes a valuable paper on the History and development of Dravidian Temple Architecture in the current issue of the "Journal of the South Indian Association." In considering the great Dravidian temples the essential parts to which attention must be bestowed are, ground plan and foundation, superstructure and decoration. A critical eye for Art ought not to be contented with merely enjoying the beauty of those parts which first strike the eye. He says the ground plan is much more important than the ornamentations of the structure and that it reveals more truthfully the purpose of the building and the character of the builders.

There are especial difficulties in determining the date of the Dravidian temples.

The oldest temples of the Dravidian style yet discovered are those at Kanchipuram, the ancient capital of the Pallava Kings, and at Mamallapuram, the seaport town of the same dynasty. Mr. Rao, Government Archaeologist suggests that those at Kanchipuram are the older, and places 310 A.D. as a possible date. His argument for this is that they are structural buildings, while those at Mamallapuram are rock cut and that the structural temples must precede those cut out of a rock. While there is no doubt some strength in this argument, yet it is still necessary to prove that the buildings at Kanchipuram were necessarily the ones from which those at Mamallapuram were modelled. Taking the earlier date however we are safe in saying that it was only during the first centuries of the Christian era that the Hindu builders employed stone.

The writer also shows that the temples of Tiruvallur, Chidimbuam, Rameswaram and Madura are far inferior to the well proportioned purposeful and restrained plan of the Kalisannadha temple at Kanchipuram or the great temple of Tanjore. He shows that the type of those temples should have been the Buddhist architecture in its palmiest days. After studying in detail almost all the great Dravidian temples in turn he arrives at the conclusion —

1 For the origin of the plan, we shall probably have ultimately to look outside India.

2 The superstructure, it is clear, was derived from Buddhist viharas.

3 The decoration at first was copied from Buddhist sources but later showed great originality but lack of restraint.

Prospects of Hinduism in the West.

This is the subject of an interesting contribution to the last number of the *Hindustan Review* by Mr. J. S. Rao. Now that Hindu Missionaries have gone to Europe and America to gain a hearing for our religion it is necessary to investigate how far these efforts are likely to be crowned with success and what are the circumstances and tendencies of Western thought which will facilitate the task of Indianising the West. Owing to the light of modern culture and the scientific spirit many of the old world causes of Christian theology are losing ground. The critical spirit has penetrated the region of religion and higher criticism has been daringly applied to the Bible. An air of cold indifference to the disputed Christian theology has given rise to a spirit of intellectual curiosity for and receptivity of, new truths that satisfy the intellectual cravings of modern culture. So much so that

No doctrine of future life is more suggestive by its affinity to some of the tendencies of modern scientific thought and the readiness with which it solves some of the most puzzling problems of human life, and is less jarring on our ideas of Divine Love and justice than the doctrine of Reincarnation together with its accessory KARMA, without which "ways of God to man" can never be justified even by a Milton. It cannot be denied that an ingenious mind can find several objections against also; but I am sure that such objections are neither so fundamental nor so numerous as those urged against the Christian doctrines. Professor Max Müller who is a very difficult man to satisfy and who inherits to the full extent the aversion of the scientific mind to accept anything without the completest evidence, has, some years ago, in expressing his opinion on the "immortality of man", expressed his partiality for the doctrines of Atma and Reincarnation. These constitute the greatest strength to Hinduism and must necessarily make their way in the West as they are ever now doing among a thinking few, who have been led to the study of the Indian scriptures.

In addition to this doctrine is another doctrine that is equally capable of satisfying the European mind—Divine incarnation. This is certainly common to both Christianity and Hinduism but the essential catholicity of the Hindu idea is sure to appeal to the European sentiment.

The attitude of Hinduism towards this doctrine is unmistakable. Says Sri Krishna: "Whenever there is decay of Dharma, O Bharata, and there is exaltation of Adharma, then I myself come forth, for the protection of the good, for the destruction of evil doers, for the sake of firmly establishing Dharma. I am born age to age." The above utterance has become classical and ought to be cherished by the Hindus in their Spiritual MAGNA CHARTA, the most precious document vouchsafed by God to the human race. If we view Incarnation as the outcome of God's mercy and love towards mankind and of his desire to be born among suffering humanity for its guidance, it stands to reason that the manifestation of the beneficence cannot be limited to an isolated instance, at a particular corner of the world, and on a particular occasion, as is the case with Christianity, but should be many as is the Hindu view. Thus the Hindu view is more logical.

There is again a growing indication of pantheistic tendencies of thought. We have incontestable evidence to show that some of the greatest English and American men of letters who lived till very recently had all indulged in pantheistic ideas. Emerson and Tennyson were saturated with them. The latter's "Higher Pantheism" and the "Ancient Sage" are beautifully expressive of Indian speculations on the subject. After quoting a few lines from Tennyson the writer says:—

I need hardly point out that there is nothing more characteristic in the above passage than affinity to VEDANTIC thought, and many similar passages may be quoted from that poem, and yet Lord Tennyson was ignorant of the fundamentals of Vedanta. How much cannot be accomplished if only Indian thought be made more familiar in the West? All these pantheistic tendencies obtaining at present with their defects cured, may be easily merged in and absorbed by the Vedanta.

Again in the matter of the sanctity of animal life of which India has long been the champion, the West is slowly reverting to the Hindu conception. Movements are busy springing in Europe and America for the advocacy of vegetarian diet. Also in disposing of the dead bodies they are copying the Hindus who prefer burning to burying. Crematoriums are slowly taking the place of the graveyards. Thus in every aspect of life Eastern thought and custom are permeating the West.

Hinduism has now victories to win and new fruitage to bear and that not among our faded race but among the Teutons, a race whose capacity for religious fervour is unsurpassed and which by its mental and moral vigour is becoming the undoubted leader of mankind. It will be our own mistake if we do not make India the teacher of the West as it has already been of the East.

The Ahmadiya Movement.

Dr. Griawold writes to the recent issue of the *Moslem World* a short and interesting sketch of the Ahmadiya Movement. This sect was first founded by Mirza Ghulam Ahmad, Chief of the village of Qadian in the Gurdaspur district, Punjab. The family of the founder came from Samarkand in Turkestan in the time of Babar and is of Mughal descent. The spirit of religious syncretism seems to run in the family. Mirza Imam ud Din a first cousin of the Mirza Sahib, put himself forward as the religious guide of the sweepers and a sort of successor to Lal Beg and preached the Ten Commandments with some changes. But Mirza Gulam Ahmed professed to have come in the spirit and power of Jesus Christ and so to be the "promised Messiah," in the spirit and power of Mahammed and so to be the promised Ahmad, and in the spirit and power of Krishna and so to be the promised future incarnation expected by the Hindus. This is one of his last conspicuous utterances he is reported to have said. —

My advent in this age is not meant for the reformation of the Mohammedans only, but Almighty God has willed to bring about through me a regeneration of three great nations viz. Hindus, Mohammedans and Christians. As for the last two I am the promised Messiah, so for the first I have been sent as an Avatar.

He defied some of the Christian teachings and believed that Jesus visited India. He attacked the various aspects of Christian theology and preached a religion of his own for which he claimed to be the prophet. It was a bold bid for the spiritual sovereignty of the world. Even to day his followers are numerous.

According to the census of 1901, the Punjab reported 1113 followers of the Mirza Sahib, and the United Provinces reported 913. The Bombay Presidency returned roughly "over 10,000." In the year 1901 the Mirza claimed "more than 200,000 followers." For 1911 the Punjab has returned 18,635 members of the Ahmadiya. Statistics for the rest of India are not available as yet, but the growth in the Punjab as compared with 1901 has been remarkable. On the basis of such facts as are available, properly 50,000 is a liberal estimate of the present strength of the Ahmadiya. Mirza Ghulam Ahmad, the founder and first head, died in 1908. He was in many respects an impressive religious personality.

Meridith Letters

In *Scribner's Magazine* for this month there appears the final collection of George Meridith's letters, ending with the last he ever wrote. It would be difficult to exaggerate the interest of these letters. They reveal the delicacy and beauty of a most poetic spirit that shunned publicity. It is to women that he writes most tenderly and unreservedly. There are some memorable passages in his letters to Lady Ulrica Duncombe, many flashes of the old wit. In his old age he pondered over the troubles of womanhood and with his enduring youthfulness championed their cause with almost reckless ardour. He writes. —

By and by the world will smile on women who cut their own way out of a bad early marriage, or it will correct the present rough marriage system. No young woman knows what she gives her hand to, she will never be wiser until boys and girls are brought up and educated together. Let me add, until English girls have wiser mothers. Such donkeys are those dames in all our classes.

About the cause of women's franchise he writes to Mr Leslie Stephen, in words, which seem too recent though they were passed as early as 1889.

The case with women resembles that of the Irish. We have played fast and loose with them, until now they are encouraged to demand what they know not how to use, but have a just right to claim. If the avenues of our profession had been thrown open to them they might have learnt the business of the world, to be competent to help in governing. But these were closed, women were commanded to continue their reliance upon their poor attractions. Consequently, as with the Irish, they push to grasp the boquette which gives authority.

He was always generous in his estimation of his contemporaries. To be tolerant of our human constitution is in itself a great virtue. He was remarkable for his courage and optimism in old age and infirmity. He had the heart of a school boy and his "religion of life is always to be cheerful."

The last letter he wrote was to Theodore Watts Dunton on the death of Swinburne. —

That form of the mind illumination is extinct. I can hardly realise it when I revolve the many times when at the starting of an idea the whole town was instantly ablaze with light.

School Boys in England.

"Custos" writing on "Our Gentlemen's Schools" in the *English Review* says that the name "public school" in England is given to what are practically the training establishments of the aristocracy and the plutocracy—chief among them being Eton, Harrow and Rugby. Englishmen are proud of these illustrious institutions which have reared some of the greatest men of Britain, among soldiers, statesmen and historians. The saying is attributed to Wellington—that Waterloo was won on the play grounds of Eton. But these glorious days are gone for ever, says "Custos."

"To day the boys are distinguished chiefly by their 'swank,' or silly air of self assertion which they imagine is the mark of a gentleman, and by 'ludicrous sticking for what is called 'good form,' the class swagger which seems to unfit boys years after they have left school for work and even for occupation."

The result is that many a boy who has had the benefits of public schools and varsity education has not learnt to do something. Those who are a credit to their schools are now feeling themselves useless. And the teachers themselves find the system altogether too strong for them. Though the system endures it is the most conservative, the wooden and antiquated business concern in the country.

What then is its effect on the English boy?

The little Etonian is a walking imp of class priggishness and class arrogance. He learns there to look on the world with a damn-my-eye carelessness that literally unfits him to take off his coat in after-life. It is not an exaggeration to say that fully half of the boys who go to our public schools come away mental derelicts, incapable of concentration, their whole outlook focused on their own personal pleasure and gratifications, looking at all serious things and at all men who work seriously with contempt. The parents, too, are largely to blame. With the advent of luxury, the modern public-school boy is a terribly spoiled and pampered little fellow, very different from the boy of *Tom Brown's* days. He may have better manners, dress better, be able to chat in a more cheery way to his elders, but he has not the fiber, the grit of the lad of thirty years ago. Spoiled anyhow he introduces his school-regging there. He goes to the

'varsity and rags. He goes into the army and rags there too, with what disastrous results we all saw in the Boer war.

The writer suggests a radical remedy, a remedy that will sweep away the spirit of 'swank.'

The main and most urgent reform is the democratization of these nurseries of class arrogance and futility—democratization, first of the spirit animating the conduct of the school, secondly, of the spirit of class 'swank' so demoralizing to the boys. This, of course, can only be effected by a radical purging of the entire system. It should begin with the free current at these places, which in these times of the plutocracy and the self-made man has lost his original point which was to guarantee the exclusiveness of the aristocratic and primogeniture set. The fact must be faced that these schools are no longer the reserve of the aristocracy and the families. Any man who has the money can send his son to a public school now. What in reality, has crept into them is the ease and vulgarity of the plutocratic spirit, and it is destroying their whole justification.

The People of India and their Arts.

The *Dawn Magazine* for October publishes a letter on the subject from Mr. J. B. Keith. Writing to the Editor he says:—

As you may imagine I continue to take a warm interest in the people of India and their Arts and am working on their behalf although in my 76th year. The Maharattas take no interest in Art. The Racio who established the Arts—that of the old Rajputs—were quite different and even remain so now at Jeypore.

He has only one or two copies of his *Plea for a Subject Race*, but as he is developing his theory in a work to be entitled *Western Civilisation in India*, we can find his ideas all there if he live to complete and publish it. He goes on to say:—

I greatly regret that the Government of India has not given the attention to *Indigenous Power* which I should wish. Mechanical Development was inevitable, but to me Sir T. Morison's *Economic Transition of India* is wholly misleading and disappointing. Despite machinery, the great enemy of Industrial Art in India, there ought to have been an attempt to save the Crafts. But Sir T. Morison would destroy the Village, the hereditary Home of Industrial Art, and no attempt is made by him to save the old Guilds, and thus I have heard Royal Engineer Officers condemn. He is all for the Industrial Proprietor and Capitalist, and I regret this new organisation is in many ways destructive. But it is too large a subject to enter on in this place.

I must, however, correct you in one particular. With no wish to detract from the merit of Mr. Havell, I must inform you that I expounded the cause of the Native Architect long before Mr. Havell arrived in India. And the views expressed in the London *Times* and *Pioneer* may be found in my "Brochure" on *A Plea for a Subject Race*. I rejoice that thoughtful Natives are taking up the subject. You are welcome to publish this statement of mine.

Real Life.

Mr. A. C. Benson in a brilliant article in a recent number of the *Public Opinion* discusses the question—what is it we are aiming at?

Politics are, after all, nothing but the making arrangements for men to live at peace with each other. People get in the way of talking of the State as if it were something above and separate from the nation. But the State is after all the nation, and Parliament is but the nation making its own rules and its arrangements.

These ideas, he says, are slowly dawning upon the people. The rights of the people are more and more getting recognized.

People will always disagree to a certain extent, and minorities will have to submit, but we are learning that the only real liberty is the freedom which does not interfere with the freedom of others.

But men are apt to get so impressed in politics that they begin to think administration an end in itself. Yet the truth is that the best governed country is the least governed country! What is the real life we are aiming at, which our political institutions exist to secure?

The object of any community is, and must be, to prevent waste, to see that no one is unnecessarily rich, and that no one is unduly poor, to reward merit by comfort, to induce men to be disinterested, public spirited, inventive, to give equal chances to all, to diminish crime and vice, and, most of all, to increase happiness.

In short, a man ought to be made healthy, neighbourly, good humoured, upright, self-restrained and orderly. Work ought to be enjoyment. But this simple programme of life is marred by many obstacles. We are confronted with disease, mental deficiency and taint of every kind.

The only cure for this is a real love of simplicity. While we desire for the sake of ostentation to have rooms we do not use, furniture which has no purpose, ornaments which cumber and do not adorn, so long will workers be set to make these things, and taken away from the work of producing useful things.

This then is the real life which we must keep in view, the life which insists on work as a duty and yet allows a wide margin of leisure, the cultivation of taste for all beautiful and interesting things in life, and the recognition of the rights of all children to be born free from inherited taint. The welfare of all should be our guiding principle in life.

Humanitarian Problems in India.

The October number of *The Humanitarian* contains a stirring appeal for humanitarian work in India by Mr. P. C. Tarapore. The writer says that there is ample scope for humanitarian service in India. With regard to the brutal punishment of whipping which is still in vogue in some savage parts of India, he has some fine personal recollections. He was for some time an executive officer in the Jawhar State with the powers of whipping the offending party and knows its futility.

It should be remembered by all administrators that it is not by the whip, not by the jail, nor yet by the gallows that we can reduce crime. Education is the only right panacea against crime. It is, in the words of Macaulay, 'a pacific triumph of reason over barbarism.'

It is also gratifying to notice the decrease in flogging in the Indian jails. Prison reform in India leaves a great deal to be desired. Female prisoners are more or less neglected. More serious efforts should be made to educate the inmates of Indian jails. My Brother, Captain Tarapore, I.M.S., organised the first prison library in Burma, and the fact that the movement has attracted the sympathy of Burmese gentlemen (who themselves have presented nearly a thousand books to the library) shows that if similar measures were taken to reform criminals in India, they would meet with the practical support of Indian philanthropists.

There is thus a world of humanitarian work to be done in the East. The appalling mortality that prevails in India among cattle is a pressing problem. It is essentially an economic problem.

The problem of the abolition of indentured Indian labour in the colonies is one of equal importance and the writer fittingly takes the opportunity of congratulating the Hon. Mr. G. K. Gokhale on his successful enterprise in this direction. Indentured labour, as Sir Vithaldas Thackersey observed, is a system of semi-slavery.

The writer concludes with the following appeal:—

Before we reach that happy consummation, however, let us congratulate Mr. Henry Cotton and Mrs. Dooner upon the far-reaching results of their work—results which prove once more that the voice of Truth may be stifled for a day or for a generation, but that its power can never be destroyed, and its final victory never be questioned.

England and the Moslem World.

This is the subject of a lengthy contribution by Mr. R. E. Forrest to the current issue of the *Imperial and Asiatic Quarterly Review*. It is an elaborate criticism of Dr. Syed H. R. Abdool Majid's recently published book—"England and the Moslem World." Mr. Syed's book is made up of a "Series of Articles, Addresses and Essays on Eastern Subjects." The author under various headings discusses the state of the Moslem world and its ultimate relation with the English power. Of the early progress of the Moslem Faith the critic observes:—

The men of Arabia were a strong race—the prophet himself was noted as large-limbed. They showed it by going out from the secure, intimate haven of the native town or village, the native land, into the unknown, dangerous, outer realm of land and sea. They were the breeders and users of the camel and the horse, the builders and users of ships. They carried the Crescent far and wide. The area of the dominion of the Faith expanded fast. It extended soon over all the lands lying between the Caspian Sea and the Persian Gulf, between the East end of the Mediterranean and the Western border of India. The Crescent usurped the place of the Cross in the most holy city of the latter, in sacred Jerusalem—and holds it still. The followers of the Prophet penetrated into China, into India, so that in the days of Aurangzeb the Eastward-going traveller would pass from Aleppo to the mouth of the Ganges entirely through Moslem lands, and, taking ship there, sail to Moslem possessions in the Eastern Archipelago. In Africa the whole of the Southern shore of the Roman Lake, the Mediterranean, passed under Moslem sway. In Eastern Europe the Turks conquered Constantinople and extended their authority over the splendid stretch of land of the Balkans; took Greece; carried their arms to the gates of Vienna. In Western Europe the Moors conquered Spain up to its Northern border. There, as in Africa, the followers of Muhammad have left splendid architectural monuments of their rule.

Then came a pause, a recession, loss everywhere to the power of Islam. In Asia, Samarkand and Bokhara, Russian power slowly crept in. India was the land, at once of its loftiest rise and quickest fall. Persia the home of Islam, as it were,

lies in the dust and ashes of powerlessness. Nay, more—

In Africa there has been a continual loss of power in all the Moslem States. Morocco is now in the grasp of France, Tripoli in that of Italy. In Europe, after long occupation, long fierce struggles, the Moslem power finally lost all foot-hold in Spain, and in the region adjoining the great capital city on the Bosphorus and stretching away from it to the Westward, Greece became free, and in the great area of the Balkans there was a continued curtailment of the power, of the extent of the dominion, of Turkey, and there would have been ere this time an extinguishment but for the rivalry of the great Powers, but for the might of England. But that must come, the last Turkish official must pass over to Asia out of Europe; the pushing back has been continuous, and can end only that way. This is not the judgment of hope, or enmity, or desire, no more than would be the pronouncement that a great land slide would find rest only in a new place and a new form.

The causes of this decadence are enumerated. Their want of education, their indolence and vain-glory and the spirit of sloth and martial torpor are put forward as reasons for their downfall. They have lost the earliest, militant, puritanical spirit of their fathers. And, then the harem and the wild luxuries of the Mughal Court are brought to mind.

The following observation of the author is pathetically apposite:—

Out of true political considerations I would suggest that it will be a very wise step if an alliance between Turkey and England, the two great Muhammadan Powers, having millions of Muhammadans under their banners; Persia, with her great traditions; and warlike Afghanistan, and other Moslem countries, will greatly strengthen the hands of the British Government. By an alliance with Turkey she will keep Russia out of the Mediterranean; by an alliance with Persia, from the Persian Gulf; and by an alliance with the Afghans, from India.

If their Majesties the King of England and the Sultan of Turkey put their heads together, and if the Shah of Persia, the Ameer of Afghanistan, the Sultan of Morocco, and the Khedive of Egypt, are also consulted, reform is easy of accomplishment.

Thus an alliance between England, Turkey, Persia, Afghanistan, and Morocco, will be a statesmanlike act, and will have a great moral force with the Muhammadans, both of India as well as of the world.

Wordsworth and Tennyson.

In the current number of the *Theosophist* there is an entertaining article on the above subject by Marguerite Pollard. The article was suggested to the writer by the study of one of Dr Steiner's books on Initiation. Dr Steiner asserts that it is fruitful to take a seed in the hand, and meditate on the life force latent in it and on the life process going on within. In this way, says the writer, we come close to the hidden mysteries of nature. A distinction between the scientific and the poetic ways of treating a subject is drawn.

Modern science has made a very close study of form and of the evolution of forms, but in spite of much accurate and detailed knowledge with regard to the form-side of things it has as yet discovered but little with regard to life. Wordsworth on the contrary, regarded Nature from a different angle, his attitude was essentially that of a seer "into the life of things." He considered that scientific study (in the modern sense) was neither the only, nor the best means of arriving at truth. He advocated a passive contemplation rather than an active observation of natural phenomena, and a receptive, rather than a critical attitude in mind.

Enough of Science and of Art,
Close up those barren leaves,
Come forth, and bring with you a heart
That watches and receives.

The mysticism of Tennyson is even more pronounced. But his speculations led him also to a belief in pre-existence. It was also the logical outcome of a belief in immortality. The world for him was no "unsubstantial fiery place" although he, no less than Wordsworth, possessed the mystic temperament and received conscious initiations of immortality. Then follows a comparison of the relative merits of the two poets.

In some directions Tennyson pushed his speculations on the great problem of immortality farther than did Wordsworth, but the utterances of the latter were always clear and consistent, whereas Tennyson wavered from one view to another. Wordsworth never doubted the truth of immortality as did Tennyson, but, living in a less materialistic age, he had not the same difficulties to encounter. Latter in life Tennyson attained to a

steadfast faith in the life after death, and expressed it triumphantly in 'Crossing the Bar.'

Sunset and evening star,
And one clear call for me!
And may there be no moaning of the bar
When I put out to sea
But such a tide as moving, seems asleep
Too full for sound and foam,
When that which drew from out the boundless
deep
Turns again home

It is never an easy matter to estimate the respective values of the messages of two poets; one star differs from another in glory but who shall say by how much the radiance of the one exceeds the radiance of the other? Yet broadly speaking, the excellence of a poet's work is in proportion to his love and reverence for his subject, and upon this principle we assign the pre-eminence to Wordsworth as poet of nature, and to Tennyson as poet of immortality.

Who are the Japanese?

Mr Arthur May Knapp asks the question and proceeds to adumbrate an answer in the *Atlantic Monthly*. The writer suggests that—

Japan has so far merely won her place among the great powers of the world. Not yet by any means has she surmounted the bar of racial prejudice and thus entered the charmed circle of Western society, to which birth and breeding are the only talismans securing admission. On the score of breeding, indeed, there ought to be no question whatever as to the qualifications of the nation whose age long training in the courtesies of life has given her pre-eminence in the practice of what we concede to be the finest flower of civilization. There remains, therefore, only the question of birth to consider.

Mr Knapp satisfies himself that the Japanese originated in Western Asia, migrating during the course of centuries eastward through Mongolia, finally making a permanent settlement in the islands of the rising sun. The article contains an interesting comparison between the culture of the Greeks and Japanese, which are both pervaded by like sentiment, and even as Greece represents the highest phase of Western civilisation, so in Japan, undisturbed by the dynastic struggles and barbarian incursions which swept away the old-time civilisation of the Orient, the Island Nation became the real repository of ancient Asiatic thought and culture.

QUESTIONS OF IMPORTANCE.

Hindu University.

The Hon. the Maharaja Sir Rameshwar Singh Bahadur, K.C.I.E., President, Hindu University Society, Allahabad, has addressed the following letter to the Hon. Sir Harcourt Butler, K.C.S.I., C.I.E., Member in charge of Education, Viceregal Council, Simla :—

Sir,—I have the honour to acknowledge receipt of your letter dated the 9th August, 1912 enclosing copy of a letter of the same date addressed to the Hon. Raja Sir Mahammed Ali Mahammed Khan Bahadur, K.C.I.E., of Mahammadabad communicating the decision of his Majesty's Secretary of State in regard to the proposed university of Aligarh. You state that it has been decided 'that the proposed universities of Aligarh and Benares should be called hereafter the university of Aligarh and of Benares respectively, and that they should have no power of affiliation outside the localities in which they may be established.'

As my committee had formulated no definite proposals and formally presented them to you, it was of course not necessary to offer any further remarks in connection with the proposed University of Benares; but I note that with regard to the proposed university at Aligarh, your letter to the Hon. Raja Sir Mahammed Ali Mahammed Khan Bahadur further intimates that the Secretary of State has decided 'that the Viceroy should not be the Chancellor and that the university should elect its own Chancellor, and that the powers which it was proposed to vest in the Chancellor should be exercised by the Governor-General in Council with one exception, namely, that the professors should be appointed without the previous approval of the Governor-General in Council.' It is also pointed out therein that the distribution of powers between the various bodies

of the university should be subject to future discussion' and 'that His Majesty's Secretary of State still reserves his discretion as to the constitution and all details not specifically mentioned' in that letter 'as defined,' and 'particularly in regard to the distribution of powers among the component bodies of the university.' You observe 'that it is essential that all matters relating to curriculum, discipline and examination should be in the hands of educational experts.' It is suggested 'that with a view to expedition of business the constitution committee should consider *de novo* with reference to the main heads of discussion and not with reference to the drafts already prepared, the desire being 'to obtain a clear and complete statement of the points on which the conference agree, after which the bill can be remodelled.'

These letters were laid before the executive committee, and carefully considered and discussed at a meeting held on the 17th October, 1912, and I have been authorised to submit in reply as follows :—

(1) In the first place the committee are extremely grateful and beg to express their sense of deep indebtedness to the Government of India and to his Majesty's Secretary of State for India for accepting the proposal for the establishment of a university for the Hindu community at Benares. They believe that this movement, which is but the natural outcome of the educational policy of the Government, and which has thus received the sanction and approval of the Secretary of State, will mark an important era in the progress of education in this country, and that encouraged, fostered and guided, as it no doubt will be, by the sympathetic support and help of the Government, and the generous co-operation of successive generations of the people of India, the proposed university will grow into an important centre for the dissemination of knowledge and enlightenment, conduce in no small measure to the happiness and

well-being of the Indian subjects of His Imperial Majesty.

(2) Turning to the points decided by his Majesty's Secretary of State for India, the first is the name by which the proposed university at Benares is to be known in future. While the members of the executive committee fully recognise that the change of name will in no way involve any change in the essential features and the scope of the proposed university at Benares, they cannot help feeling that the new name proposed for it will not appeal to the Hindu public at large throughout India to the same extent as the one by which it has till now been proposed to be called. Located at Benares, the sacred city of the Hindus, the association of the word Hindu with its name will not only satisfy a much cherished sentiment, but will also indicate and point out that it will be for the benefit of the entire Hindu Community of India, that it looks for support and help to every member of that community, and that it must be regarded by them all as their own special institution. The executive committee has consulted the donors on this point (as on other points too) and they find that public opinion is very strongly in favour of retaining the name originally proposed. The committee hope that the Government will be pleased to allow them to do so.

(3) As to the second point settled viz., that the university should have no power of affiliation outside the locality in which it is established, the decision, as you have rightly anticipated, has caused a deep disappointment. The committee note that your letter points out that the decision is final and 'must be accepted as such,' and they feel extreme reluctance in soliciting a consideration of that point. They are constrained to do so by the desire expressed by the great majority of our donors, who have evinced deep interest in the proposed university, and they do so in the hope and belief that their representation on the point will receive the sympathetic consideration of the Government.

To take each of the four practical objections to the grant of power of affiliation outside the locality in which the university may be established, in their order, the committee would, as to the first of them, venture to point out that this objection is at any rate very much minimized by the fact —

(a) That affiliation to outside colleges would only be granted under rules approved by the Government to institutions as well equipped as one of the university colleges in any branch of learning and science.

(b) That institutions applying for affiliation will be required to make religious instruction an integral part of their work.

(c) That they will be residential colleges, and fully equipped as such.

(d) And lastly that, as in the case of the existing Indian universities, affiliation will depend, after all, in each case, on the final sanction of the Government. The number of institutions likely to fulfil all these conditions will at any rate for a long time to come be inconsiderable. The proposed universities at Benares and Aligarh as also the recently proposed university for Dacca must, no doubt, necessarily draw a number of students from the territorial limits of the Allahabad and Calcutta Universities. They will do so in either case. With proper safeguards, there is little fear of a conflict of territorial jurisdiction, or of undesirable competition. The committee may further be permitted to point out that unless colleges at Dacca and Benares already affiliated to existing universities, are all required to seek affiliation to the new universities to be established at these places, a certain amount of overlapping of jurisdiction is inevitable even under the restricted powers proposed for the new universities.

(4) The second objection is that with the grant of power to affiliate outside colleges the standard would be inevitably kept down, and that it would destroy the hope that they would become genuine seats of learning at which examinations would be

subordinate to teaching and the teachers free to develop the intelligence of their students and not merely exercise their memories. The existing British Indian universities, which control teaching in affiliated colleges, and hold examinations have not, so far as the committee has been able to ascertain led to the lowering of the standard of the degrees, nor to the limiting of the scope of the teachers' work in developing the intelligence of their students. With the safeguards enumerated in the preceding paragraph, there is every reason to hope that the danger mentioned in the second of these objections will be avoided. The great distances in India make it extremely difficult for students from every part of India anxious to secure the benefit offered by the proposed university, to come over to Benares. It is only in the case of higher studies that such concentration is most beneficial. If post-graduate studies were concentrated at Benares, while the study for the degree were also permitted in well equipped colleges, much of the objection would be obviated.

(5) The third objection pointed out would apply with almost equal force to the several affiliated residential colleges at the centre. Each college has its own tradition. The objection however deals mainly with the existing traditions of Aligarh and need not be discussed any further here.

(6) The last objection will no doubt have considerable force were the number of affiliated colleges to be large. It has already been pointed out that the number of colleges satisfying the conditions of affiliation will be very inconsiderable for a long time to come. The Government will always have the power to limit affiliation at any point it likes. But if no colleges are affiliated outside Benares, the cherished hope of the promoters to shape a curriculum which will conduce to the development of Hindu culture will be realisable in Benares alone.

(7) In this connection the committee deem it their duty to point out that it would be absolutely

necessary for the proposed university to hold a Matriculation examination at various centres in India. It would also, like other British Indian universities, have power to recognise schools. Besides this, it would no doubt recognise the certificates granted by other universities, or the department of Public Instruction in each province. But in the case of the Oriental Faculty and the Faculty of Theology, it would have to depend mainly upon the schools it may be able to recognise which promote preliminary instruction up to a certain standard to enable students to qualify for prosecuting higher studies at the university.

(8) The committee regret that it has not been found possible to grant the university the privilege of having the highest representative of the sovereign as their Chancellor. They feel no small disappointment at this decision. They hope that it will be found possible to reconsider the decision on this point. But in any event they would feel very gratified if the university be permitted to place at its head as its protector the august name of his Majesty the King-Emperor, and they hope that his Excellency the Viceroy will be pleased to become its Patron. His Majesty the King-Emperor has graciously bestowed this favour on the Welsh University, and we trust that we are not presumptuous in asking for a similar grace for the Hindu University.

(9) As to the other points relating to the constitution of the proposed university at Benares, the committee beg to submit them herewith in the form of a draft bill and memorandum, which set out the main features of the constitution. The preliminary details can, they think, be best settled by conference and discussion between the representatives of the committee and the Government.

UTTERANCES OF THE DAY.

The Civic University.

Lord Haldane who has been installed Chancellor of the Bristol University delivered a brilliant address in the Colston Hall on "The Civic University."

After thanking the citizens of Bristol for the high distinction conferred upon him, Lord Haldane traced the growth of the movement which led to the foundation of the younger universities, and continued—

There was a time when men of business, accustomed to see closely to profit and loss, used to think that the work of a university was worth effort and expenditure only in so far as it produced aptitude for industrial and commercial production. Traces of this view are still apparent in the foundation deeds of some of the older university colleges of our municipalities. But this idea is now discredited, and the part played by science and by general learning in the production alike of the captain of industry and of the extension of invention is far greater than was the case even a few years ago. Applied science in its best form only possible on a wide foundation of general science. And the fruitful scientific spirit is developed to day on a basis of high intellectual training, the training which only the atmosphere of the fully developed university can completely provide. What is true of science in the narrower sense is also true of learning generally. It is only by the possession of a trained and developed mind that the fullest capacity, *quo, quo*, as a general rule, be obtained. There are, of course, exceptional individuals with rare natural gifts which make up for deficiencies. But such gifts are indeed rare. We are coming more and more to recognize that the best specialist can be produced only after a long training in general learning. The grasp of principle which makes detail easy can only come when innate capacity has been evoked and moulded by high training. Our engineers, our lawyers, our doctors, our administrators, our inventors, cannot without it keep in front in the race, or hold their own amid the rivalry of talent, unless their minds have been so widely trained that the new problems with which the ever-increasing complications and specializations of modern conditions confront them present nothing more formidable than new applications of first principles which have been thoroughly assimilated. Without having reached this level they cannot maintain their feet. The competition is not merely with their fellow countrymen, it is with the trained minds of other countries. These other countries are some of them advancing at least as rapidly as we are.

THE UNIVERSITY LEVEL.

An enlightened policy in education is the order of the day over most of the civilized world, and if we are to

hold our own, even in the making of money, we dare not fall behind or lag in the endeavour to increase our efforts. I see no sign that we Britons are diminishing one whit in our really great capacity. In many respects, notably in certain of our public institutions, we are advancing so rapidly that we continue to lead the way, and our production of wealth is not falling off. Moreover, I do not believe that we are really losing what is equally necessary, that spirit of respect to the laws which we have made for ourselves that has been one of our chief glories. But we have more than ever before to see to it that we keep at least abreast in science, and science means far more now than technical training or the mere application of special knowledge to industry. It rests on a foundation of general culture which is vital to the maintenance of its standards, and it can develop only if the population has the fullest chance of an intellectual and moral training which goes deeper than mere science strictly so-called. It is the power of the highly trained mind that is required, and the full development of this trained mind can only be given by the highly organized universities.

This brings me to my next point. It is said that it is only the comparatively few that can attain to this level. That is quite true. And it is neither requisite nor possible that every one should be trained up to it. If we had all the universities in the world concentrated in England we should find that it was only a limited percentage of the population that would be fitted by natural aptitude to take full advantage of them. What is really essential is that every one should have a chance, and that there should be the nearest possible approach to equality of educational opportunity. Without this the sense of injustice will never be eliminated, and we shall in addition fail to secure for our national endeavours the help of our best brains.

THE HIGHER CIVIL SERVICE.

It is felt, and felt rightly, that the Universities of Oxford and Cambridge have had an undue advantage in the higher Civil Service. They continue to fill a very large proportion of the vacancies. Because Oxford and Cambridge until now have proved to be the best training place for the candidates is not altogether an answer to the complaint. Education quite as good for the purpose might be given elsewhere. But such education, to be sufficient, must be of a high order. After a good deal of observation, both while I was at the Bar and while I was in charge of an administrative department, I have come to the conclusion that as a general rule the most stimulating and useful preparation for the general work of the higher Civil Service is a literary training, and that a classical education is for most men the best form, though not exclusively so. No doubt men vary, and science or modern literature may develop the mind, in the case of those who have aptitude for them better than Latin or Greek literature. But, as Goethe said long ago, the object of education ought to be rather to form tastes than simply to communicate knowledge. The pedant is not of much use in the conduct of public affairs. For the formation of tastes and of the intellectual habits and aptitudes which the love of learning produces the atmosphere of highly organized university life is a tremendous power, and we cannot do without it. And therefore while I am not without sympathy with the complaint of democracy that the entrance to the higher positions in the Civil Service is by far too much the monopoly of a class, I reply that a highly-edu-

ated clerk is essential for a particular kind of work which the State needs

A NEW DEMOCRATIZING CAMPAIGN.

The remedy must not be to displace the class which furnishes the supply. Democracy is apt in its earlier stages to be unduly jealous, and to try to drag things down to a level which, because it is the general level, is in danger of being too low to provide the highest talent. The remedy for what is real grievance appears to me to be that democracy should add a new plank to its platform, and insist on equality of opportunity in education as something that should be within the reach of every youth and maiden. That more than a comparatively small minority will prove capable of taking advantage of the highest education is unlikely. We are not all born with the same capacity. But that many will seize on a new opportunity who are at present shut out is to my mind certain. And if democracy will abandon the suggestion that the highest work can be done without the highest educational preparation for it, I shall be the most whole-hearted supporter of the inauguration of a new democratic campaign. There are those who possess the inborn initiative and capacity which can do without the ordinary educational avenues. They have existed at all times and they exist to-day. They must be taken into account and provision made for them by special promotion. But these are nature's aristocrats, and the number of true aristocrats is always very small. We have to legislate for the ordinary man and woman and we cannot do more than make provision for that equality of opportunity in the higher education of which I have spoken.

THE CLASS BARRIER.

Elementary education is now the right of all, and since the passing of the Education Act of 1902, an Act the immense advantages of which have always appeared to me to outweigh certain awkward blemishes which have still to be got rid of, the clever boy or girl can generally, by means of a scholarship or a free place, get to the secondary school. But the chances for the poor scholar to get from the secondary school to the university, although they exist, are still far too few. The Labour leaders are quite right when they complain that the prizes of the State are in reality far too much reserved for the upper classes. Where they are wrong, I think, is in the remedy they propose. The State will suffer badly if the level of its civil servants is lowered, and it will be lowered if the qualifications for all positions are lowered to the educational equipment possessed by a youth who has coasted his studies at 18. The true remedy is to break down the class barrier by making provisions for enabling the youth of 18 to go on, if he is fit to do so, and to qualify himself more highly. Now here is where the civic university has a great part to play. It is idle to say, as is sometimes said, that Oxford and Cambridge include the democracy. Theoretically they do, but not one child of the people out of a thousand has a real chance of becoming an undergraduate there. More accessible universities are required, and these new universities, I am careful to add, will only successfully compete with Oxford and Cambridge in serving the requirements of the State if they keep their level very high.

Here, then, is a new object of ambition for you, the citizens of Bristol. You have it in your power now, if you so choose, to make it possible for the son or

daughter of every poor man in this city, be he high or be he low, to attain to this splendid advantage in life. Only few can be chosen; that results from the fact that the order of nature does not permit us to be born equal. But the many may and ought to be called, even if the few are chosen. Let us turn to the practical application to the affairs of your city of this great gospel of educational opportunity. Those who believe in democracy have not yet awakened to its significance. When they do they may come to think that here lies the most direct path to the attainment of their end.

THE OLD UNIVERSITIES.

The inhabitants of this great city are all of them directly interested in it. Therefore I appeal to all of you—to workmen and employers, to the man who can just manage to educate his children and to the wealthiest alike—to concern yourselves in a great civic cause. Do not let yourselves be influenced by the criticism that is sometimes made even to-day by those whose ideas about university influence are entirely derived from the contemplation of the older universities. No one is more keenly conscious than I am that there has grown up around Oxford and Cambridge an atmosphere, which it is impossible to reproduce elsewhere. It has been the growth of the tradition of centuries. It has developed the finest qualities in scholarship. But as a detached observer, I must add that this atmosphere and the habits which it has developed in us have hindered as well as helped.

The awakening has come to the old universities of late. They are now doing very fine work, but they ought to have been able to develop it much sooner. Some stimulus has been wanting. Had their students lived under a national system where there were many universities, and where the scholar was free to move from one to another to seek the professor of his choice, instead of being tied up in his academic domicile of origin, the teachers would have been stimulated and things would probably have moved far more rapidly under the development of the rivalry of talent. But the dominant atmosphere was that, not of the laity, as in Germany, but of the Church, and the result was somnolence. There was lacking the alertness which comes from the supervision of the keen mind and practical instinct of the nation's great men of business. The latter may not know much of literature or science or philosophy, though among them there will always be those who do know. But they recognize quality when they see it, and they are jealous lest the institutions for which they are responsible should be outdistanced in foreign countries. If the new English universities can keep their level high they may be able to develop a certain advantage over the older English universities.

THE FUTURE.

I can see no limit to what may be the development of the civic university within the next hundred years. I look to its becoming the dominant and shaping power in our system of national education. We have got into all sorts of difficulties, religious and otherwise, from beginning too low down. Now, if the community would be in earnest in setting educational ideals at the top and in letting its educational system be permeated from the upper stratum downwards I should have much hope that the controversy about the lower schools would disappear in the pursuit of larger ends. But this implies that the universities should take a large part in shaping the

spirit and endeavour of the secondary and elementary schools, and, a condition of this, that the entire organization of education should be shaped by Parliament into a comprehensive and connected system. In 1904, by passing the Scotch Education Act of that year Parliament took up a step in this direction for Scotland. But in England the work has yet to be done, and it may well be that the new university spirit in our great cities will compel its commencement.

Specialization in each city university there will be and ought to be. *Non omnia possumus omnes*. In one place the distinctive strength will be in chemistry—general and applied—for exist without each other they cannot. In another, as in Sheffield it will be the metallurgy of iron and steel and it is not unimportant in this connection that Sheffield is the chief centre for the manufacture of the national guns and steel plates, an industry in which we dare not dispense with high science. In another place, as in the case of the Imperial College in London, we should have the great training place in the metallurgy of the precious metals for the students of a people which leads the world in their production. Some universities will be strong in engineering, civil and mechanical, or it may be marine. But the one thing requisite is that the broad foundations of the highest general knowledge should be there in each university and that all specialization should rest on these foundations. You cannot, without danger of partial starvation, separate science from literature and philosophy. Each grows best in the presence of the others. Another essential feature is adequate provision for the post graduate student—that is, the student who having taken his degree, has in him the passion for excellence sufficiently strong to desire to continue in the university as a place of research and of the still higher learning which is inseparable from research. Such students may not be numerous, but when they are present they give a distinction to the university and to the professors under whom they work which could not be possible in their absence. Finally it is one of the characteristic features of the new universities that they are freely opened to women as well as to men. This is an advance which it is difficult to overrate and in days to come its influence for good may prove to be very great.

INDIANS OUTSIDE INDIA.

How the Colour Matters.

The following are a few chips from personal experience by Mr. Manilal M. Doctor, M.A., LL.B., Barrister at Law, published in the *Modern Review* for October, 1912.—

In 1905, when I visited Rangoon, the Health Officer of the Port detained me and other Indian passengers of the second class and asked us to take off our socks to be disinfected with our other clothes—though European and Eurasian passengers were allowed to go immediately without having to fumigate their clothes. Our protests were of no avail.

The same year on my way to England on the *S. S. Arabia*—our Anglo-Indian fellow passengers kept themselves scrupulously aloof from us—Indian students.

Even in England one Anglo-Indian, a retired Colonel, accosted me and roughly spoke to me in Hindustani that we Indians should not go to England to study for the Civil Service, Bar or the Medical Profession—but remain content as farmers.

When I went to New York in 1907, I found that the lower class Americans knew not how to distinguish between us (Indians) and the descendants of their emancipated negro slaves. Consequently there is a great difficulty in finding bedrooms in such houses—unless some influential Americans help us by recommending us to desirable persons.

During my stay in Mauritius my colour earned me the appellation "*Malabar 'avocat' (advocate)*"—the word *Malabar* signifying "coolie."

When I was travelling from Agra Fort to Allahabad, to attend the last Congress there, a "lady" in the first class objected to us—"Natives"

travelling with her—there was with me a Kshatri Judge from Ajmere with his sons.

In September last year, on a visit to Mr. Gandhi in South Africa—a mere police Sergeant in Durban took no notice of me (in spite of my protests) until he had finished with passengers who had white skins—even third class passengers—and then detained me and examined me in English by dictating an application, although my professional status was known to him (having been mentioned against my name in the passengers' list); besides I was detained 4 hours on the boat.

In Durban the tramcars (municipal electric) do not admit us inside—we have to ride on top and they must take back-seats only with the local negroes; and on the South African Railways at first only third class-seats could be booked for Indians. Even now in the first and second class Indians and non-whites must travel in compartments labelled "Reserved."

In the Transvaal no Indians are allowed on the tramcars; and on the railways Mr. Gandhi and myself (we had got into the compartments in a hurry) were shifted to a reserved compartment. We are called "coolies" or "Sammys"—sometimes without meaning any offence as these words have become our natural name—in South Africa—and no hotels or restaurants or theatres would admit us—no white barbers would shave us and no lifts would take us up—and indeed no white friends can let us put up in their homes.

On my way from Mauritius to Calcutta—to attend the Congress—in December last—Indian third class passengers were told "get away you d—d niggers" and once the poor Hindoos proceeding on a pilgrimage to our holy places were kicked off the kitchen and their meals, to enable the chief officer of the boat (it belonged to the British India Co) to check their number before arrival in Colombo.

In March this year the Captain of the "Umlazi" obliged me and my wife to go for medical exami-

nation to the shed where third class passengers are examined—though the doctor (a Bengali gentleman) was astonished to see us there—and assigned to us a cabin, which he did not consider suitable for white passengers. Afterwards when I applied for a better cabin (which had fallen vacant), I was warned that we could be removed from it to our old leaky cabin if at any subsequent ports European passengers came on board. In Durban harbour buggie of Indians alone was fumigated.

Going in a carriage to the Zoo, in Durban, my wife was surprised by some European children on the way talking aloud about us designating us as "coolies."

I am now sailing for Fiji *via* Australia. In Cape-town the steamship companies refused to book me a passage for Australia without obtaining a permit to land in Australia. I had to pay the Australian agent in Cape-town for a cablegram to Melbourne asking for permission to land for transhipment to Suva (Fiji). Even on this boat—S.S. *Argyllshire*—some low class white passengers from South Africa objected to my sitting for meals with them in the saloon, though I must say the Captain, the Doctor and other passengers were ready to accommodate me with a seat near them.

I just see that my baggage was labelled "Coolie—Capetown," when I left Johannesburg for Cape-town to sail for Australia. Now this is a deliberate way of insulting our people because any one can read our names on our bags, trunks, etc. This is the way in which white porters of Railway Stations in South Africa deal with our countrymen.

The above facts are of common occurrence in the life of most of us who calling ourselves "British subjects" wander a little further from our Indian homes; and they certainly open our eyes. I hope they will open those of your readers of a certain class.

Indian Students in Australia.

Replying recently to an allegation that the effect of the very severe administration of the Australian immigration Restriction Act had been to keep a student out of Australia, the Commonwealth Minister for External Affairs (the Hon. J. Thomas) said a mare's nest had evidently been discovered. The complaint was apparently, that an Indian desired to go from Calcutta to Brisbane to study at an Australian college, and that he had been refused a passage by a shipping company because the admission of some Indian had previously been refused.

Who was it that had been thus refused, and under what conditions? That was all important. All a coloured student from India had to do was to get a passport from the Indian Government and he would be admitted as a student in the Commonwealth for twelve months. Whether he would be allowed an extension of that term would be considered when the time arrived. As to the statement in the "Englishman" that it ought to be possible for any Indian to learn beforehand whether Australia would discriminate against him, Mr. Thomas asked, What about the Post Office? Scores of letters were received by the department from persons who wanted to know whether they would be admitted. An answer was given in every case.—*India.*

Indians in Canada.

Mrs. Elizabeth Ross Gorce writes from Strassburg Saskatchewan, Canada:—

To day we are in the midst of harvesting the greatest crop yet seen in the West—a crop that promises to exceed all records by 100,000,000 bushels. Yet there is proportionally less labour available to harvest it. Face to face with the shortage of help, some farmers became interested in the suggestion to employ Sikhs.

The Hindus in the coast province are a very fine lot of men. They are chiefly Sikhs. They are a strong, hard-working, intelligent set of men

—vastly superior to some of the South European peoples welcomed to our shores.

In view, then, of the great scarcity of farm hands for the West, it comes as a surprise to learn that within the past two years Canada has enforced the exclusion of Hindus. Some 4,000 are domiciled in British Columbia. During last year only one Hindu was admitted into Canada. In the first five months of this year 2,000 Chinese were admitted. One Hindu student who had been resident in Canada and gone home for a visit was refused re-admission.

Canada is wholly inconsistent in her policy of exclusion. Can it be that Chinese and Japanese fare better because outside Governments have made it a point to secure concessions for their people from Canada? And is it because the Hindus are British citizens that such an unjust discrimination is allowed to continue?—*India.*

Immigration into Costa Rica.

The following translation of Decree No. 1 of the 15th January 1912, issued by the President of the Republic of Costa Rica, is published for general information:—

"The immigration into the country of individuals of the coolie class is absolutely prohibited, and with regard to such individuals, the regulations laid down in Articles 2 and 3 of Decree No. 1 of the 10th June 1904 shall be brought into force.

"NOTE.—The regulations referred to in the above mentioned Decree (No. 1 of the 10th June 1904) were instructions to Captains of Ports to refuse admittance or permission to land to any individuals of prohibited races who might be on board any ship."

It has been ascertained from the Republican Government, that the term "coolie class" has been used in the decree as a synonym for "Hindu or Hindustani labourers."

R. L. EKHOTEN,

Secretary to the Government of India.

FEUDATORY INDIA.

Education in Cashmir.

His Highness the Maharaja of Kashmir and his Minister, Dr. A. Mitra, are to be congratulated on being the pioneers of successfully introducing religious and moral instruction in public schools, which has now received the approbation of His Excellency the Viceroy. The minister addressing His Highness in his banquet speech in Srinagar, said:—"I am particularly glad to learn that you have decided to make religion and morals the subjects of special instruction. This I regard as a most important feature in the State's education system for the formation of character is the only true education." And again in the Srinagar College:—"I was glad to hear in the address that in this College, as in other educational institutions of this State a place is given to moral training and religious instruction in one's own faith. That I consider to be a most important feature, for I do not think that any education is really worth the name unless it is associated with the teaching of religion. Without religion I do not see how character can possibly be formed, and no learning is worth having without character."—*Leader*.

Educational Endowments in Travancore.

It is very gratifying indeed to learn that Mr. Anantarama Iyer, the Fozzudari Commissioner, has invested a lakh and fifty thousand rupees in the Government of India Pro. Notes for charities, the net annual dividend from the said investment amounting to about Rs.5,000. Out of this sum Rs.1800 has been set apart for the purpose of awarding certain Scholarships in H. H. the Maharajah's College and in the Higher Grade Secondary Schools of the Travancore State. The Travancore Government is by the deed of settlement, constituted sole Trustee and the scholarships are to be awarded to Brahmin students of the Mukani sect.

Kapurthala Administration.

The administration report of Kapurthala State, just issued, shows that under the superintendence of Mr. L. French, C. S., Chief Minister, steady progress towards efficient and economical administration is being made in every department. Closer control and personal supervision are gradually exercising a most beneficial influence. Reforms are never effected without creating dissatisfaction, and it is not surprising that the efforts of the Chief Minister to purify the administration, to abolish sinecures, and to cut down superfluous expenditure have occasioned discontent in certain quarters. But the fact that the changes have been salutary, and that the Minister retains the full confidence of the Maharaja, is shown by His Highness' request to the Punjab Government to sanction a further deputation of Mr. French until April, 1915. The report contains ample evidence of the improvement effected in recent years' and by the time Mr. French's second period of administration is ended every branch of the public services should be in a thoroughly sound and healthy condition.

The Indore Education Committee.

A Committee has been appointed by his Highness the Maharaja of Indore to consider the general educational policy of the State. The committee consists of Mr. Bhagwar, Education and Judicial Member; Mr. G. Gardner Brown, Director of State Education; Mr. Syed Ali Hasan, Revenue Member; Mr. Sara Mal Bapna, Assistant Private Secretary to his Highness; and Mr. V. G. Dalvi, Foreign Secretary.

A New Law in Travancore.

The Nair regulation has been passed by the Travancore Legislative Council. It recognizes the present mode of presentation of cloth by the bridegroom to the bride among the Nairs as a legal form of marriage. As there has been no form of marriage among the Nairs recognised by Law, the Nair regulation has been welcomed by all classes,

The Baroda Alembic Chemical Works.

Prof. T. K. Gajjar, the Consulting Director of the Alembic Chemical Works Co. Ltd. which is under the patronage of H. H. Maharaja Sayajirao Gaekwar, requested the University Inspection Committee which consists of the following members:—Dr Mackichan, Dr Harold Mann, Father Sierp, Major Hutchison, Mr. Bhabha, to pay a visit to the Alembic Chemical Works. The Committee were kind enough to accept the invitation and they were received by Professor Gajjar and Mr. B. D. Amin the General Manager, along with Prof. A. M. Maazani, Minister of Education and Dr. C. A. L. Mayer, Chief Medical Officer, Baroda State. The Members of the Committee were first taken to the Library and Fermentation Laboratory, where experiments on yeast culture were being carried on. The Members were shown under the microscope the culture of pure yeast and they were highly satisfied with the sample of yeast shown and the scientific manner in which the work of fermentation was being controlled. As yet the distillers do not know that fermentation was the soul of the Alcohol industry and the Committee expressed their satisfaction at seeing that the problem was being solved by the Alembic Company. The Library also forms a good collection of books on Alcohol manufacture, Pharmacy and Statistics.

They were then taken to the Chemical Laboratory where the members were shown how Mahuda analysis was being carried on to estimate the percentage of sugar which can be converted into Alcohol. They were also shown how the yield of Alcohol on a large scale was being controlled by Laboratory experiments. The fermented juice was being distilled in the Laboratory to find out the percentage of Alcohol so that it can be checked whether all the sugar was being converted into alcohol and whether any sugar was being wasted.

They were also shown the Revenue still by which the percentage of alcohol in tinctures and

other spirituous products was being estimated. They took keen interest in all these experiments and they expressed their satisfaction at seeing that the work of the Laboratory attached to a Commercial concern was done so systematically and that about a dozen graduates in science were given a scope to acquire knowledge of Technological Chemistry.

From the Chemical Laboratory they were led to the gold chloride room where gold chloride was prepared from gold on a commercial scale for photographic purposes. They were also shown how the glass tubes were being sealed by a specially trained man for the purpose. They were then shown a still where perfumes and essential oils were distilled.

Then they passed to the main portion of the Factory—the Distillery. All the members were highly impressed with the working of the French Still which is specially ordered out by the Company and which was set a working by Prof. Gajjar who has trained many students to work this complicated still.

Dr. Mann examined the rectified spirit prepared by the Company and he expressed his entire satisfaction when he saw that the Company has successfully grappled the problem of entirely removing the smell of the Mahudas. This was a standing problem in the whole of India and this is solved by the Alembic Chemical Works. Dr. Mann particularly remarked that the Distillery was conspicuously clean and he did not feel the stench of the Mahudas or any other bad smell, although such a large quantity of about 800 maunds of Mahudas was being daily used.

This is the only Distillery in India where such machinery is being worked and where Alcohol is being manufactured on such a large scale.

One apt remark which Dr. Mackichan made was that such large Chemical Works with many varied and elaborate operations were efficiently conducted by young native graduates without any initiative or guidance from the European experts.

The Mysore State Finances.

The Mysore State pays the British Government the compliment of imitating its favourite method of under estimating the revenue and making the tax-payers the gift of a handsome surplus. In 1910-11 the surplus was estimated at under 6 lakhs. It actually amounted to over 24 lakhs. The revised estimates for 1911-12 should have shown a deficit of a little over 3 lakhs, but there is a modest little surplus of about 14½ lakhs. The budget estimates for 1912-13 follow the tradition, and provide for a deficit of nearly 33½ lakhs, but there will be quite another story told later on. The most satisfactory features of the new budget are the large additional provision for education, investigation of special industries, the provision of 20 lakhs for irrigation and of 7 lakhs for electric tramways in Bangalore. New railway construction claims 12½ lakhs. What the State has done is to invest the savings of past years in large projects and measures of far-reaching importance in connection with material and moral progress of the population. The people are fairly prosperous and the administration is progressive.—*I. D. News.*

Mysore Industries.

The Hon. Mr. Chatterton, expert adviser to the Mysore Government on Industries, delivering the first of a series of lectures, at the Mysore Industrial Exhibition, drew attention to the great waste of labour in regard to existing small industries in the province, and the prospects before the people of Mysore if they would rely more upon themselves both as to capital and enterprise, mentioning the Kolar gold industry as an example of foreign enterprise and finance. He said that the electrical power of the Cauvery falls was being fully utilized at present, but they should be prepared with their schemes of industry against the installation of increased power from that source about three years hence, when the Cannambady project would augment the power facilities of the Cauvery River.

INDUSTRIAL AND COMMERCIAL SECTION.

Chemical Works for Bombay.

It is announced that a scheme is well in progress for the establishment in Bombay of large chemical works, where sulphuric acid will be manufactured on a large scale, and a number of other chemical products will be prepared. This will be the first extensive plant for the manufacture of chemicals to be laid down on this side of India. Its site, it is stated, will be about six miles from the docks, and arrangements have been concluded for the necessary water supply and for a railway siding. The site is to be near the sea shore, so that there will be facilities for disposing of waste products, and sufficient land is being taken up to afford opportunity for extensions in the future. The promoters are connected with the chemical industry in Manchester and Cheshire, and it is their intention here to take up the manufacture of fertilisers and to produce cheap chemicals for the textile industry. Chemical works are always attendant upon the existence of big industrial works in the neighbourhood, and it is thus a striking sign of Bombay's progress, that, a large factory of this kind should be established here.—*I. I. & Power.*

Preserving Fish by Carbonic Acid Gas.

This is the latest invention, which promises to revolutionise the fishing industry. It is claimed for this new method that it will, besides costing only about an eighth of the price of ice, effectually prevent putrefaction, an effect which the present method fails to produce. The new method has been invented by a Cheltenham solicitor, Mr. H. T. Randolph Hemming, and briefly, the system adopted is to force all air out of the fish. This is done by placing the fish in a tank and pumping in carbonic acid gas at a pressure of 60 lbs. to the square inch, four times the ordinary atmospheric pressure.

The Indian Cotton Bureau in London.

A London Correspondent writes to the *Madras Mail*:—A somewhat remarkable movement has recently been inaugurated in London. It has been felt for a long time that very little is known in the United Kingdom as to the conditions under which the various industries of India are carried on. There is much misrepresentation there as regards one of them, the cotton industry, in particular. Accordingly it has been thought desirable that some organisation should be formed in London to represent this industry, so that the conditions referred to may be explained to the public in the United Kingdom, as well as to every Member of Parliament, and, when necessary, may also be represented to the Secretary of State for India. As matters stand at present, the debates in Parliament on Indian matters are of the most perfunctory character. With the exceptions of foreign affairs, discussion is almost entirely confined to the single night on which the Indian Budget is considered. Questions as to business affairs in India are frequently asked, but these are invariably answered in the customary official manner, the information conveyed being usually the minimum that will content the questioner.

In view of these facts, certain Indian mill owners have recently established in London the Indian Cotton Bureau, to be worked in the Metropolis, but controlled from India by a Committee of cotton manufacturers there. Its design is to inform public opinion in the United Kingdom, and more particularly in Parliament and the Press upon various matters of importance affecting the Indian cotton industry. The following are some of the questions upon which it is desired to instruct public opinion in England:—

(a) The grossly perverse and unjustifiable levy of an excise upon cotton goods produced by manufacturers in India which, in the name of Free Trade, maintains a measure of Protection or Pre-

ference in favour of manufactures of cotton goods in Lancashire.

(b) The necessity of increased subsidies from the Imperial Government of India to Provincial Governments for the purpose of extending and improving the growth of cotton in the Dependency.

(c) Keeping Parliament and the Secretary of State for India informed as to the progress of cotton cultivation in India, and as to the grants made annually for this purpose by the various Provincial Governments.

(d) The submission of representations on the above and cognate matters to the Secretary of State for India.

In the event of a policy of Imperial Preference being adopted by the Mother Country, the Bureau would make known the views of Indian manufacturers as to the character of reciprocity they favour.

It should be understood that the Bureau will be concerned solely with what may be called the politics of business in India. It will not transact any commercial business whatsoever, nor will it exist to make profits. The undertaking, in fact, will be directed to securing for India among those responsible for its Government and also among the British public a proper conception of the conditions affecting Indian industrial problems. Primarily established to promote the political interests of the Indian cotton trade, it is hoped in time that its operations may be extended to cover other Indian trades and industries, such as tobacco, jute, paper, wool, sugar, iron, glass, Burma oil, etc. There are, further, certain general questions of the greatest importance to India which it is desirable to ventilate, amongst which may be mentioned the insufficient financial support accorded to Indian railways; the use in Great Britain by the India Office of surplus cash balances belonging to India, and other matters generally of vital importance such as the assimilation of Indian Company Law to English.

Industrial Education in the Punjab.

The report of the Committee on Industrial Education for the Punjab has been published. Mr. W. S. Hamilton has offered a note of dissent, and Mr. Godley, President, has also contributed a supplementary note. The following are the views and recommendations of the Committee:—

While favouring the development on sounder principles of the industrial schools maintained by local bodies and private agencies, the Committee think that industrial schools of a more specialised type should be instituted experimentally by Government in selected localities. These schools of special industries should, they think, be placed under the charge of expert European artisans, who would probably be obtained on a salary of Rs. 350 rising to Rs 500, or of Indians trained in Europe or America. Only industrial instruction should be imparted in these schools, and no fees should be charged. As a rule, there should be a primary school attached as a feeder to these specialised schools, in which ordinary general education should be given up to the primary standard combined with elementary manual instruction, the object being to attract children of the artisan classes. These specialised schools of industries should be open to all classes; boys should not be admitted below the age of ten and should have completed, if possible, the Primary course of general education. The localities suggested for the establishment of such schools are: Sialkot and Rewari for metal-work; Ludhiana, Lahore, Hoshiarpur and Amritsar for weaving; Kartarpur, Amritsar and Jullundur for woodwork. The members of the Committee who visited Sialkot have formed the opinion that an expert English tool maker in charge of a school of metalwork might prove of much assistance to the local industries. The establishment of a school of pottery may also be eventually advisable; but for the present the Committee recommend that the Pottery section of the School of Art be developed

on the lines of industrial experiment. The Committee think that schools of special industries on the lines suggested above should be entirely financed by Government and that they might suitably be controlled by the Department of Industries, assisted in each case by an advisory committee of local employers. The inspection of these schools should, as far as possible be carried out by experts. The Committee consider that the aim of the training imparted in the existing industrial school, which is to afford literary instruction of a simple character, combined with hand-and-eye training and elementary industrial work, is a sound one. They doubt, however, whether general education beyond the Primary standard is necessary for boys of the class which it is desired to attract to industrial schools. As such instruction tends to make pupils disinclined to follow their hereditary callings, they recommend, therefore, that in the case of new industrial schools, Middle departments for general education should not be instituted, and that such further education as is desired should be optional and imparted, when possible, in evening classes. The defects noticeable in the existing industrial schools are mainly due, in the opinion of the Committee, to unintelligent teaching on the industrial side; and to insufficient equipment and to inadequate supervision and guidance. Only competent teachers should be employed, and they should be paid a higher salary than they can otherwise earn.

In order to raise the standard of industrial schools maintained by local bodies and missionary societies, the Government should offer liberal grants in-aid to schools which reach a standard approved by Government; and by making adequate arrangements for efficient instruction in crafts, it is hoped that private schools will thus be induced to raise their standards so as to earn these grants. The Committee consider that the Mayo School of Art should develop its teaching department in order to supply specially trained teachers,

A Piano Factory for India.

A piano factory established in India under efficient management would undoubtedly prove a boon not only to the public in general but also to the dealer, for it is quite evident that a piano built in this country can be turned out at less cost than one of similar quality and finish can be imported from home. There will be a considerable saving in the price of timber alone, accessories purchased from home will scarcely cost more than they do in Europe (export orders generally receive special treatment) and wages are cheaper here than they are at home. As for tone there is no reason to doubt that a sweet and full toned piano can be turned out in India, for excellence of tone is not confined to a certain climate or nationality, but is the product of careful selection and ingenious construction.

Thus, in the first place, the dealer will have the advantage of a lower price, he will not be compelled to carry an excessive stock; he will be able to arrange easier terms of payment, and last but not least, he will have the factory at hand and not thousands of miles away. It must not be supposed that the establishment of a piano factory in India will cut off the chance of home-makers in this country. It will above all create an increasing demand, because thousands of people who now look upon the piano as an unattainable luxury will then be able to invest in an instrument, and amongst those whose means allow of an extra outlay, there will always be some who will prefer to buy from home. The fact that by establishing a means of supply the demand will be considerably enhanced is a very important point. For a considerable time past pianos have been made in the Far East, and no complaints have been heard that European or American makers of high class instruments have suffered thereby. If cheap and nasty products of the piano industry have been shut out, so much the better. By the way, neither the Chinese nor the Japanese can be said to be better

musicians than the people of India, and if the piano industry in the Far East has fair prospects for the future, why should not a similar project bear fruit in India? This is a question which possibly experience may answer, for we believe that a project of this kind is under consideration, and any who are interested in it should communicate with Mr. O. Hummel, 28, Esplanade Road, Bombay.—*Indian Industries and Power.*

Sugar Industry in the Punjab.

The following Press *communiqué* has been issued by the Punjab Government.—On the recommendation of the Punjab Government, the Government of India have obtained the sanction of the Secretary of State to the deputation of Mr. J. H. Barnes, Principal, Punjab Agricultural College, Lyallpur, to Hungary and Egypt to collect and examine practical information on the beet sugar and cane sugar industries in those countries, with a view to the introduction of modern methods of cultivation and manufacture in the Punjab. At the present time the sugar industry shows few signs of advancement on up-to-date lines, and it may therefore be anticipated that the knowledge acquired by Mr. Barnes during his visits to the above countries will lead to a higher development of the industry in the Punjab.

Indian Imports and Exports.

Sir William Byles asked the Under-Secretary of State for India.—If he will state what was the proportion of merchandise imports into India and of merchandise exports from India during 1910-11 in the case of the United Kingdom, other British possessions, and foreign countries, respectively.

Mr. Montagu.—Of the imports of merchandise (excluding Government stores) into India in 1910-11, 61.1 per cent. came from the United Kingdom, 8.0 per cent. from other British possessions, and 30.9 per cent. from foreign countries. Of the exports, including re-exports, the percentages were:—United Kingdom 21.8, other British possessions 17.4, and foreign countries 57.8.

Motor Cars in Bombay Presidency.

An interesting fact is brought out in a study of the registration numbers of motor cars in the Bombay Presidency, remarks the *Times of India*. As no "blanks" are allowed to stand, each number being allotted to a new car as the car formerly bearing that number is withdrawn, the numbering of the cars gives a very fair test of the increase in the total. In October last year the highest registration number issued was 1,920; the highest number now in use is 2,256—the difference, 336, indicating the growth in popularity of motor vehicles. That is nearly a car per day, and though of course it is a small growth compared with the rate of progress in western cities, it is still quite sufficient to put another nail in the coffin of the old theory about the changeliness of the East. It has also not a little comfort for at least a part of the commercial community. When such varied vehicles as a Rajah's motor car and a motor lorry are included it is of course almost impossible to strike an average price for these new additions, but even taking the cost of each at the very low estimate of Rs. 4,000, we reach the quite respectable total of Rs. 13,44,000 as representing the growth in value during the year. The motor car industry at any rate seems to have no reason to complain of hard times.

A Rubber Substitute from Sea Fish.

A report coming from Amsterdam tells of a factory established at Ymuiden, at the mouth of the North Sea Canal in Holland, to produce a substitute for rubber. It is said that the company operating the factory has succeeded in producing a substance having the qualities of rubber and some special advantages over the genuine. While the process is a secret, the principal ingredient is said to be fresh sea fish, which are brought to Ymuiden in vast quantities by the Dutch fishing fleets.—*Science Signings*.

AGRICULTURAL SECTION.

Eri Silk.

The Agricultural Research Institute at Pusa has issued an interesting bulletin giving directions for the cultivation of *eri* silk. It used to be thought that this fabric was the monopoly of the Naga and other tribes in Assam. It has however, been discovered that the *eri* silkworm can be reared and the silk produced anywhere, where the castor plant will grow, all that is required being a certain amount of moisture in the atmosphere. The production of *eri* silk is eminently suitable for a cottage industry.

Preparation of Tobacco by Electricity.

A short article in the *Journal d'Agriculture Tropicale* for June 1912 states that the journal *De Indische Merkuur* has recently given notice of the discovery by an Engineer of Sourabaya of a new process for preparing tobacco in place of submitting the leaves, for several weeks to the action of warm air, as is usual; they are exposed for twenty-four hours to the action of electricity. Unfortunately, nothing is said as to the way in which the operation is conducted nor concerning the manner of action of the electricity: whether there is an electrolytic action on the very damp leaves, or if the change comes about through discharges at high voltage or in any other way.

The matter of importance is, however, that this mode of working should not only greatly shorten the time required for the operation, but should bring under complete control the extent to which the colouring of the product takes place. It should be added that, according to the report, the results are yet far from being conclusive, but if they are eventually confirmed, the new manner of procedure will completely overthrow the ordinary methods for tobacco preparation that are employed up to the present in the many factories in Java, which, it is said, are eager to adopt its application.

The Milk of Indian Buffaloes.

Dr. Harold H. Mann, Agricultural Chemist to the Government of Bombay, and Mr. A. A. Meggitt, Agricultural Chemist to the Government of Bengal, published some time ago under the auspices of the Agricultural Research Institute, Pusa, a valuable paper in which they considered the composition of the milk of several breeds of Indian cows. The paper was published in the *Memoirs of the Department of Agriculture in India (Chemical Series)*, Vol. II, No. 1. The second part of the paper which has just been published is devoted to a consideration of the composition of the milk of some breeds of Indian buffaloes. As the milk of the buffalo is extensively used in India it would be interesting to record the results of the experiments initiated by Dr. Mann and Mr. Meggitt. They say that there seem to be very few data up to now recorded with regard to the composition of the milk of the Indian buffalo. "It is known to be richer than that of European or even of Indian cows, and hence the buffalo is valued highly as a butter-producing animal. Most of the data which are on record, however, seem to be for the buffalo in other countries than India." It was Mr. F. Strohner who practically speaking examined first the composition of the milk of buffaloes, he analysed the milk of buffaloes found in Transylvania and found a high percentage of fat (over nine per cent), and did not notice any essential difference in the butter from that produced from cows' milk. A very complete examination of the composition of the milk of the Egyptian buffalo was made in 1890 the results of which were recorded in the *Journal of the Chemical Society* in that year. The next analysis of the milk of buffaloes was that made by Mr. Leather in India who summarises his results as follows:—

It will be seen that the majority of the samples analysed are characterised by an extraordinarily high proportion of butter-fat, 7 and 8 per cent.

being common, and in one case close on 10 per cent. was found. Buffaloes' milk is white and the butter is also usually quite white.

The percentage of proteids in buffaloes' milk is distinctly higher than in cows' milk and varies from 3.5 to 4.3 percent. The percentage of milk-sugar and the mineral matter correspond very closely with those of cows' milk. On the other hand, the relationship between these three ingredients is not the same as for cows' milk. In one particular sample (that of the mixed milk of the herd) the percentage of proteids was higher than found in most of the individual milks; but this does not materially alter the fact. If one takes the mean figures, the relationship works out to about 10 : 12 : 2. It is probable that the proportion of proteids is necessarily higher in a milk containing so much butter fat in order that the albuminoid ratio may be maintained.

The investigations of which Dr. Mann and Mr. Meggitt report the results were carried out during a period of fifteen months on a number of buffalo cows belonging to the Poona Civil Dairy. Their analyses confirm, they say, all previous results and show how very rich in fat and other valuable constituents is the milk of the Indian buffalo. Considering the importance of the buffalo as a milking animal in India which is so largely employed both as a milk and butter producing animal a critical examination of the detailed figures supplied by the authors of the paper would be of very great service to those who are interested in the matter. Dr. Mann and Mr. Meggitt say that given suitable conditions, the Indian buffalo stands out from the best breeds of milking cows as a producer of butter fat. "It would be interesting," they add, "to follow this up, and ascertain, taking into account the original cost, the cost of feeding and supervision, the relative advantage of keeping buffaloes and cows for the production of butter under conditions similar to those existing in Poona."—*The Tribune*

Departmental Reviews and Notes.

LITERARY.

RABINDRA NATH TAGORE.

The Rev. Mr. O. F. Andrews of Delhi in the course of an interesting article in *The East and the West*, an English quarterly review for the study of missionary problems, speaks of Mr. Tagore in these appreciative terms:—Rabindra Nath Tagore is the greatest living poet in India. He is a member of the Brahmo Samaj, a deeply religious man, and an earnest student of the Christian ideals of conduct. His verses are sung in every household in Bengal and far beyond its borders. It would not be an exaggeration to say that no other living poet in the world to-day has so moved his own race and age. Three years ago I was staying at a village in the heart of the Himalayas, as far from the poet's home as London is from Constantinople. Some Indian music was being sung in the village at the end of the day and a little lad of twelve began to sing a poem of Rabindra's whose theme was the Motherland. The dialect of the song was difficult for the Hillsmen to follow, but the drift of the words and the subdued passion of the young singer were wholly intelligible. The audience swayed backwards and forwards, as if moved by an enchanter's spell. Such is the power of the poet's music and verse in India.

THE LATE PROF. SKEAT.

We regret to record the death, writes *The Nation*, of Professor Skeat, the famous philologist and the first Professor of Anglo-Saxon at an English University. Students are indebted to him for his edition of "Piers Plowman" and his "Etymological Dictionary of the English Language." But the "Times" is correct in calling him a great etymologist rather than a great professor or a great Anglo-Saxon scholar. On the whole, his influence must be regarded as tending to emphasise the characteristic faults of English scholarship of the professorial type.

A NEW QUARTERLY.

Prof. W. Sanday tells in the *Contemporary Review* of a scheme for starting a splendid new review.

"The intention," he says, "is to start a new quarterly, to be called *The Constructive Quarterly*. The first number will in all probability appear at the beginning of the next year. It is to bear the very comprehensive sub-title 'A Journal of the Faith and Work and Thought of Christendom.' This ecumenical title is to correspond to ecumenical contents. The idea is to bring together writers of all Churches and all schools on the one common ground of a Christianity which claims to be constructive. In this way it is hoped to work towards the more distant goal of Rounion. The initiative comes from America. The editor is Mr. Silas McBea, editor of the *New York Churchman*."

A REMARKABLE ORIGINAL CONTRIBUTION TO
INDIAN HISTORY.

Professor Radhakumud Mukerjee's "History of Indian Shipping" has already been so widely appreciated by the Press (both European and Indian) and eminent authorities on the subject that it needs no introduction at our hands. A really forgotten chapter in Indian History as the work is, it is unique in its originality, the more so because "every authority on the subject has been ransacked" as Mr. Vincent A. Smith has very appositely remarked. The information collected from the original Sanskrit MSS. are especially novel and interesting.—*Collegian*.

ON NEWSPAPERS.

"I have never regarded newspapers as places for people to agree in; if ever they completely become so (as they sometimes show signs of doing) I shall take to hoardings or pamphlets or paving-stones or some other surfaces on which to inscribe my views," says Mr. G. K. Chesterton in the *Daily News*.

EDUCATIONAL

TECHNICAL EDUCATION ENQUIRY

The Government of India have forwarded to the Secretary of State the Report by Colonel Atkinson and Mr Dawson on the Technical Education Enquiry with a covering letter. The Government of India write —

Much has been written and said about Technical Education in India and many experiments have been made. It seemed to the Government of India that the time had come to endeavour to connect the educational institutions more closely with business firms, railways and other employers of labour, to enquire how the former can better meet the requirements of the latter, and to point out the way to the farther employment of Indians in them. For this enquiry Colonel Atkinson and Mr. Dawson were selected as having special practical experience of the subject. They have conducted the enquiry with evident care in the leading industrial centres of India. The Government of Burma have agreed that no special enquiry was needed in that Province, and they have submitted an extremely interesting and valuable Report from which the Government of India have little doubt much good will result in the future. One of the features of the Report is the record in Part 2 of the interviews with employers of labour. This is, perhaps, the most useful contribution yet recorded on the subject of technical education in India, representing, as it does, the matured experience of practical men of business. The Government of India desire to thank the gentlemen whose opinions have been incorporated in Part 2 for the assistance which they have given in this enquiry and for their frank expression of their experience and opinion. To those many who are ready to assist in future by taking apprentices their special thanks are

The Governor-General in Council is disposed to agree with the conclusion (paragraph 15 of the Report) that the general result of the enquiry, except for the present in the high grade, is very favourable. There are in India, as there have been elsewhere, difficulties to be overcome, but on the whole, and seeing how young technical education in India still is, there seems good reason to hope that with patience they will be surmounted. The great need which the Report emphasises is to make education more practical, not only in technical schools, but also in primary and secondary schools.

MR T PALIT'S SECOND GIFT.

Mr T Palit, the well-known Calcutta Barrister, who made a gift last June of seven lakhs of rupees to the Calcutta University for the founding of a College of Science, executed another deed of gift of a similar amount for the same purpose.

DR PRABHU DUTT SHASTRI.

Dr Prabhu Dutt Shastri, M.A., M.O., L., Ph. D., D. Sc. (Oxford) has been appointed as Professor of Philosophy, Presidency College, Calcutta. The Oxford University in recognition of the merits of his research in mental and moral philosophy awarded Dr Shastri the sum of Rs. 1,000.

CO-EDUCATION.

Lord Lytton presided at a meeting convened to advocate the education of boys and girls in the same school. The sanest argument in favour of co-education in boarding schools is that by this means the best substitute is found for a natural healthy family life. The segregation of either boys or girls in an educational institution from which the other sex is excluded has always been an unnatural and an unhealthy plan. This argument applies to boarding schools alone. In day schools the family life continues at home. But while this extension of family life into the boarding school is advocated, it ought not to be concluded that identical curricula are suitable for boys and girls,

LEGAL.

INDIAN AND ENGLISH POLICE.

Sir Murray Hamrick, who was Acting Governor of Madras, gave the following account of Indian and English police defects in his speech to the Vellore police on the 19th October:—

There is one subject on which you Indians of the country ought to be far superior to any Englishman who comes here, and that is, of course, in your talents for investigating and detecting crime. And I can only again suggest to you here that you should keep up as the highest principle which should guide you, provincial men, always in your service, that you are never to sacrifice to the pride of detecting crime in the slightest degree the honesty of the work that you should do.

It has always been an accusation against the police of this country that, although they may have a strong case, and a good case, they can seldom or never resist pitching the case up for the courts with evidence which is not wholly true. That is an accusation, which, as long as it remains with any justification against the police of this country, is a thoroughly damning one.

I am happy to say that in England, although the police there originally were very extremely unsatisfactory, and although the remarks which were made by the Commission which sat on the English police in 1840 or 1839 were quite as damning of the police in those days as the remarks which were made by the Commission here—I am glad to say that since that day the morale of the police in England has so improved that we Englishmen now take credit to ourselves that the police in England, as far as honesty and solid good work are concerned, are the best police of any country of the West, and, I can say that one never, or very seldom at most, hears an accusation against the police in England that they put up

evidence which is tainted. They are accused of being stupid and are very often stupid. We cannot help that. That must be. We cannot give brains where they do not exist, but we can at all events by improving the morale of the Force to the highest standard of honour which should obtain in the Force stop the production of false evidence in the courts. And that, I think, is the one thing which you Provincial Service men must remember, and must bear in mind always. No matter how bad your taste is, and how difficult your work is, for God's sake keep tainted evidence out of the courts.

THE COPYRIGHT ACT.

A Gazette of India Extraordinary, issued in Simla on October 30th, publishes the text of the Copyright Act of 1911 and notifies its enforcement in India from the same date. The following is the text of the proclamation:—"In pursuance of clause (d) of sub-section (2) of section 37 of the Copyright Act 1911 (1 and 2 Geo. 5 Chapter 46) the Governor General is pleased to proclaim the said Act and to direct that it shall come into operation in British India from the date of this proclamation."

MARRIAGES IN JAPAN (VALIDITY) BILL.

Mr. Acland, in moving the second reading of this Bill, explained that after 1899, when Great Britain gave up extra-territorial rights in Japan, it became necessary the marriages solemnised in Japan, in ways known to the English law, should be registered by the Japanese authorities. In twenty or thirty cases such registration had not taken place, and the Bill would remove any suggestion that those marriages solemnised before the treaty came into force were not legal. After debate the Bill was read a second time and committed to a Committee of the whole House.

MEDICAL.

IS GREY HAIR CURABLE?

The subject is constantly discussed here by medical men, as well as by others whose interest in it is obvious, if less scientific, writes the Paris correspondent of the *Pall Mall Gazette*. It seems to be conceded that greyiness can be cured. Professor Metchnikoff's theory that it is caused by a microbe (to which he has given the name *chromophage*) eating out the colour is not universally accepted, but there is at least warrant for it in the established fact that hair can turn almost instantly white. Marie Antoinette's hair became blanched during the night preceding her execution. And in dermatological practice, many facts of a similar nature are recorded. M. Metchnikoff proposes to expel the microbe by the application of heat and as I explained the other day, certain experiments are now being carried out, and are said to give good result. One of the well known specialists engaged in this work is Dr. Sabouraud. He declines, however, to make a statement for the moment. When definite conclusions are established, he will make a communication to the scientific press.

FOR DIABETIC PATIENTS.

Patients suffering from diabetes are advised to observe the following instructions—Diet and hygiene are of the utmost importance and ought to be carefully regulated. Exercise is valuable if followed by warm bath containing a little washing soda. Fatigue is objectionable and flannel under clothing desirable. Milk cure is often efficacious, six to ten pints of skimmed milk every day, and no other food for six weeks and then animal food being recommended. Pills 25 in number made of 40 grains of lithia carbonatis 1 grain of sodic arsenatis, 20 grains of ext. gentiane are to be taken one in the night and one in the morning.

HOW TO PREVENT DISEASE

If, writes an authority, disease is the effort of the organism to throw off retained poisons, it can be prevented by taking care that no such accumulation shall occur—by taking care that the balance shall be maintained between the amount of poison formed within the body and the amount carried off by the organs for the removal of the same. The keynote of preventing disease is internal as well as external cleanliness. Simple foods in small quantities at long intervals, the daily drinking of large quantities of pure water, moderate, enjoyable exercise, the daily bath, the colon flushing, care of the excretions, avoidance of over-work, worry, excitement, or unkindliness—these conditions will give practical immunity against all diseases save those arising from surgical injury.—*Science* *Siftings*.

THE COW ITCH PLANT.

An interesting account is given in the *Indian Medical Gazette* of an outbreak of nettle-rash in a company of a Punjabi regiment which underwent field training in the direction of Mandalay Hill. When the men returned to their quarters after an absence of three hours many noticed an itching sensation, and soon a large number of them were affected by a rash, the wheals of which varied from a pin's head to a fig—in size. The eruption lasted for three days, when it disappeared. An investigation was made into the possible causes of this curious outbreak, but no explanation could be discovered until it was noticed that at the foot of Mandalay Hill a creeper was growing over bushes, shrubs and trees, and that its fruit pods were covered with innumerable slender hairs which readily struck to the skin and produced an intolerable itching. Nor is it necessary to touch the pods. The breeze carries the hairs to the passer by. This the Burman well knows, for he makes a detour to avoid a tree adorned with this creeper. Its botanic name is *Mucuna Pruriens*, and it is known in England as the cow-itch plant.

SCIENCE.

THE FIRST LIFEBOAT.

It is to France that we are indebted for nearly every invention that pertains to saving life at sea. The first lifeboat rendering her safer than other vessels was invented by a Frenchman, a Monsieur Bernieres, in 1765, the first belt that would support its wearer in the water by Gelacz, another Frenchman; and as early as 1757 we have records of a French method of resuscitating the apparently drowned.

ELECTRICAL METHOD OF TREATING TIMBER

A novel electrical method of treating timber is said to have given striking results in France, and to have changed the greenest wood into perfectly seasoned material. A water-tight tank of suitable size is required. The timber is piled on a large lead plate at the bottom until the tank is full, when a second lead plate is placed on top of the pile and connected to the negative pole of a dynamo, the bottom plate being connected to the positive pole. The space around the timber is then filled with solution containing 5 per cent. of resin, 10 per cent. of borax, and a trace of carbonate of soda. On turning on the current, it passes from plate to plate through the wood, driving out the sap, and the resin and borax take its place in the cells and interstices. This process being completed, the timber is taken out and dried when it is ready for use.

SOMETHING NEW IN THE SUN.

There is reason to believe, says Prof. J. W. Nicholson, of the Royal Astronomical Society, that the spectrum is now revealing in the corona of the sun a more elementary form of matter than any yet discovered on the earth. It is proposed to call this elementary substance "nebulium." Prof. Nicholson says the spectrum of the far-distant nebulae in the depths of space indicates that they are composed of this same "nebulium," which is coming to light in the solar radiations.—*Science* *Siftings*,

GIRDLE OF WIRELESS AROUND THE GLOBE.

The Government's plan to girdle the globe with wireless telegraph stations is rapidly being developed by the Postmaster-General. He will start with seven stations—one each in England, Egypt, British East Africa, India, Singapore, South Africa and Australia. The gaps in the circle will be filled in latter. The cost of the seven stations, exclusive of sites and buildings, will be about £60,000. There will be a continuous night and day service, with a speed of twenty words a minute duplex, and fifty words a minute when simplex instruments are used. Each of the seven stations will be able to communicate over the long intervening distances, amounting in some instances to 2,000 miles. India and the South African Government will each bear the expense of its own station. The Government wireless coast service around the British Isles is now complete, working continuously day and night.

PROFESSOR KAPP'S INVENTION

The ability of an ordinary condenser of the tin foil and dielectric type to produce a "leading current" in alternating current circuits and thus improve the power factor has long been known, and has been utilized in dealing with high voltages and frequencies. But at the low voltages and frequencies of ordinary commercial electrical apparatus the size, and therefore the cost of a condenser, would be prohibitively high. Professor Gisbert Kapp has now come forward with an entirely new type of dynamo-electric condenser, which he calls a "vibrator." This machine advances the phase of an alternating current by injecting into the latter a suitable electromotive force. In the operation of the machine, during the "charge" in each cycle of alternation the electrical energy is converted into the kinetic energy of a rotating mass, and during the following "discharge" the energy is given back as electric current at the pressure of supply.—*Times of India*.

PERSONAL.

THE PRINCE OF WALES AT OXFORD

The Prince of Wales, who has taken possession of his rooms at Magdalen College, will as far as possible live the life of an ordinary undergraduate while in Oxford.

"It is understood that the Prince will stay at Oxford for a year, at least," says the *Evening News*. "The late King was at Christ Church for two years, but he lived at Frewin Hall, and not in college rooms, as the Prince will. The Prince will automatically become a member of the Magdalen Junior Committee Room, and he will in all probability follow his grandfather's example, and join the Union Society. But it is doubtful if he will join any clubs at all. King Edward was a member of the 'Bullington,' but this is closely connected with Christ Church."

MR. TILAK'S MEMORIAL

An important question has arisen in connection with the imprisonment of Mr. Tilak, which calls for the most earnest consideration. In July 1908, Mr. Tilak was sentenced to six years' transportation and a fine of one thousand rupee. Under the terms of the sentence, which involved hard labour he was entitled to earn remission by good conduct, and would be due for release this autumn. The Government of Bombay chose, however, to commute the sentence to one of simple imprisonment which carries no such privilege with it. The net result, therefore, is that Mr. Tilak (who was not consulted in the matter) has had to purchase the "favour" at the cost of an extra eighteen months' imprisonment. We can hardly believe that this was intended. A memorial has been presented by Mr. Tilak, in which these facts are set out and we hope it will meet with a favourable reply.—*India*.

MR. P. D. PATTANI, OF THE BOMBAY COUNCIL.

Mr. Prabhaskanker D. Pattani who has recently been appointed a member of the Bombay Executive Council was born at Morvi. His first appointment was that of tutor to the present Maharaja of Bhavnagar. Subsequently he became private secretary to his Highness and afterwards Dewan of Bhavnagar. During his tenure of office as the Dewan, the state has reached the height of prosperity, the finances being in a healthy condition. The extension of railways, and the improvements of the harbour have received much of his attention, and the progress of education has been continuous and steady. The famine administration of the state has reflected great credit on his energy and resources. Several difficult questions have confronted him during the last few years, and none of them was so formidable as the control of the customs of the port of Bhavnagar. This question has been decided in favour of the state, and it is no exaggeration to say that the satisfactory result was due mainly to the exertions of the Dewan, who had staked his reputation on the issue. A Savings Bank was opened in the state, and Bhavnagar was probably the first native State which successfully raised money in the public market and the fact, that it was taken up at once showed how high was the credit of the state. There is at present no more popular figure in the whole of Kathiawar than Mr. Pattani, and this popularity is due to his sincerity and force of character. He is a man of many-sided activities and his fame as an able administrator of an important state has brought him in contact with various important commercial and industrial undertakings in the presidency. Thus he has represented the state on the board of directors of the Tata Iron and Steel Works, the Tata Hydro Electric Company, the Bombay Steam Navigation Company and many other enterprises.

—*The Times of India*

POLITICAL.

THE REVISED COUNCIL REGULATIONS.

Opportunity has been taken of the revision of the Council Regulations for the Provincial Legislative Councils for Bombay, the United Provinces and the Punjab to declare that officials are ineligible for election as Members of the Councils, and also to make clear the Clause about the terms of office. Both Civil and Criminal Courts have been empowered to declare a voter as of unsound mind. Clause 13 of the Regulations regarding a quorum has been simplified.

As regards the Bombay Council, there is hardly any change of importance, as there is no alteration in the constitution. The changes are, therefore, merely technical.

The revised Regulation for the United Provinces Council provide for an increase in the number of elected Members from twenty to twenty one, and that they shall be elected as follows:—(1) One by the University; (2) four by the Municipal Boards (Schedule 2); (3) nine by District and Municipal Boards (Schedule 3); (4) two by landholders; (5) four by the Moslem community; and (6) one by the Upper India Chamber of Commerce.

In the Punjab, the number of elected Members is increased from five to eight, and that of official Members is reduced from nineteen to sixteen. The elected Members shall be returned as follows:—(1) One by the Punjab University; (2) three by the Municipal and Cantonment Committees; (3) three by the District Boards; and (4) one by the Punjab Chamber of Commerce. Regulation 13 has been amended as follows:—"The power of making Laws and Regulations and of transacting other business vested in the Legislative Council of the Lieutenant Governor shall be exercised only when eight or more Members of the Council are present."

RACIAL INEQUALITIES.

The Badge of Inferiority which the Hindus were made to wear still continues to be worn by them. In the course of its comments on the highly unsatisfactory nature of the revised regulations for the United Provinces the *Leader* says:—

"A Mahomedan Khan Sahib as Khan Sahib will be a voter; a Hindu Maharaja as Maharaja will have no vote. A Mahomedan B. A. of yesterday and day before is a voter; Dr. Sunder Lal will go voteless. Mr. Karamat Husin is a voter as a trustee of the Aligarh College; Pandit Madan Mohan Malaviya is not as a trustee of the Central Hindu College."

It is a wonder that the Government cannot realize to what evil results such an invidious distinction made by itself is likely to lead.

BRITISH NEUTRALITY IN THE BALKAN WAR

The Bengal Government has issued the following press communique:—A Royal Proclamation dated 25th October, 1912, has been issued by His Majesty the King-Emperor declaring the neutrality of his Majesty's Government during the state of war between Turkey and Bulgaria, Turkey and Greece, Turkey and Montenegro and Turkey and Servia.

The Proclamation which has been republished in the Gazette of India, draws attention to the provisions of the Foreign Enlistment Act 1870 (33 and 34 vic cap 90) whereby any British subject who without license of His Majesty accepts service in the Military or Naval forces of either of the belligerent Powers or in any other way infringes the conditions of neutrality renders himself liable to be punished by fine or imprisonment or both at the discretion of the Court before which he is convicted.

In order that no subject of His Imperial Majesty may unwarily render himself liable to prosecution, the attention of the public is invited to the provisions of the statute, which is in force throughout British India.

GENERAL

TYPES OF INDIAN CIVILIZATION.

Sir George Birdwood writes to the London correspondent of the *Bombay Gazette*.—"The Hindus, the Mahomedans, the Mahrattas, the Tamils, the Bengalis, and others are all great historical peoples, which great literatures of their own and idiosyncratic arts, thus all standing in the applied arts at the head of all the nations of the world at this day. Any deliberate attempt to weld these noble races and civilizations into a single homogeneous nationality would in my thought and feeling be a blasphemy against history, and the soul of our common humanity and I thank God it would prove an impossibility. I will say no more for the present."

THE NEW WOMEN OF INDIA

In a review by the Lieutenant Governor of the Punjab of the Administration of Civil Justice in the past year a passage occurs which tells very plainly of a revolt among the women of India against the idea that their sex can be treated as cattle, or household chattels. The Lieutenant Governor says—

"With regard to matrimonial suits, it is noticeable that women are showing an increased tendency to repudiate allegations of marriage by *chadar andaz*: to members of their deceased husband's family. In some cases the sex have even advanced further and sue to repudiate marriages contracted for them during their minority by persons other than their lawful guardians. This quickening of a sense as to their rights under the personal law is a sign that women are becoming more emancipated, and, as has already been remarked in connection with the administration of the criminal law during 1911, a time is not far distant when there will be a demand for a more tangible form of ceremony in connection with marriages which will leave the fact of a marriage less open to doubt and less dependent on the oral allegations of more or less professional witnesses."

THE BURMESE AND MARRIAGE

Every writer on Burma has remarked on the extreme freedom of marriage among the Burmese.

The Burmese maiden shows a perfectly catholic taste in the matter of her choice of a mate. She is as ready to marry a Chinaman, or any of the Indian races who come over to the province as she is to marry an Englishman, if it suits her turn. One result of this is the great number of hybrid and indeterminate tribes which have developed forms of speech of their own dialects that have been dignified with the name of languages. Very often that difference of dialect is strengthened by the difference of dress which may, in some cases, have been due to masculine pride of race, but in most cases is no doubt due to feminine love of finery, a something striking in the way of garments. The father may have retained some pride of race and have displayed it in the dressing of his family, or the children may have wanted to show that they were not the same as their neighbours and so differences began which have extended to whole communities. Two things have especially contributed to it. One is the entire absence of caste among the Burmese and the Shans and the other is the extreme freedom with which marriages may be dissolved—*Rangoon Gazette*.

HINDUS AND MUSLIMANS

The advice which Sir Charles Bayley gave to Hindus and Mussalmans at Gya is one which all lovers of India will heartily welcome. His Honour voiced the feelings of the progressive party in India when he said—

"So long as both the Communities should work hand-in hand for the common welfare of the country, both communities would enjoy his full sympathy, and His Honour would do his best to further the interests of both communities. His Honour mentioned the case of the Nizam's Government where no distinction as to race and religion was made by the State and where Hindus and Mahomedans lived in perfect unity."

Indians in the Public Services.

THE VOICE OF THE VENERABLE PATRIARCH.

[“ This question of the services is not simply a question of the aspirations of a few educated men, it is the question of life and death to the whole of British India ”—Dadabhai Naoroji 1887.]

[“ The Public Service Commission (of 1886) instead of giving us “full justice” has deprived us of all our hopes and aspirations to be admitted to an equality of employment with British officials, and we were coolly, mercilessly, despotically, and illegally consigned to a small Pariah Service.”—]

THE INDIAN REVIEW.

A MONTHLY PERIODICAL DEVOTED TO THE DISCUSSION OF ALL TOPICS OF INTEREST,
PUBLISHED ABOUT THE THIRD WEEK OF EVERY MONTH.

EDITED BY MR. G. A. NATESAN.

Vol. XIII.

DECEMBER, 1912.

No. 12.

INDIANS IN THE PUBLIC SERVICE.

BY THE EDITOR.

IT is somewhat significant that the appointment of the Public Service Commission which will commence its sittings in our city shortly has by no means been heralded with the loud flourish of trumpets like its predecessor. Indeed, it is idle to conceal the fact that people are viewing this Commission with alternate feelings of hope and fear. For the question of the share which Indians should take in the administration of this, their own country, recalls to the memory of every loyal and self-respecting Indian, on the one hand, the wise and benevolent intentions and declarations of Parliament and on the other, the series of acts by which the Anglo-Indian bureaucracy in this country have been systematically trying to nullify the same.

The sad tale of the history of the question of the employment of Indians in the Higher Services is briefly told. The first great step taken by the British Parliament in regard to the employment of Indians in the administration of the country was the Act of 1833, which declared

That no native of the said territories nor any natural born subject of His Majesty resident therein, shall by reason only of his religion, place of birth, descent, colour or any other, be disabled from holding any place, office or employment under the said Company.

Macaulay declared:—

I must say to the last day of my life, I shall be proud of having been one of those who assisted in the framing of the Bill which contains the clause.

The Court of Directors in forwarding a copy of the statute which contained this clause to the Government of India took care to point out:—

The meaning of the enactment we take to be that there shall be no governing caste in British India; that whatever other tests of qualification may be adopted, distinctions of race or religion shall not be of the number; that no subject of the King, whether of Indian or British or mixed descent, shall be excluded either from the posts usually conferred on our uncovenanted servants in India, or from the covenanted service itself, provided he be otherwise eligible consistently with the rules and agreeably to the conditions observed and enacted in the one case and in the other.

But though racial disaoidity was removed by the Statute of 1833, still for all practical purposes, it remained a dead letter. For when in 1853 the question was again taken up in the House of Commons by friends of India like the late Lord Stanley and the great tribune of the people, John Bright, it was admitted that the Statute of 1833 made the natives of India 'eligible to all offices' under the Company. But during the twenty years that have since elapsed not one of the natives has been appointed to any office except such as they were eligible to before the Statute.

The only thing which Parliament did in 1853 was to abolish the system of nomination and patronage and to throw open all the principal civil appointments for competition among the natural born subjects of Her Majesty. But though competition was introduced, the examination was in effect shut out to Indians as the authorities laid down strictly that it was to be held only in London and not simultaneously in India. No wonder that Lord Stanley declared that

he could not refrain from expressing his conviction that in refusing to carry on examinations in India as well as in England—a thing that was easily practicable—the Government were, in fact, negativing that which they declared to be one of the principal objects of their Bill, and confining the Civil Service, as heretofore, to Englishmen. That result was unjust, and he believed it would be most pernicious.

Let them suppose, for instance, that instead of holding these examinations here in London, that they were to be held in Calcutta. Well, how many Englishmen

would go out there—or how many would send out their sons perhaps to spend two or three years in the country on the chance of obtaining an appointment! Nevertheless that was exactly the course proposed to be adopted towards the Natives of India.

Another Member of Parliament went so far as to state "that the bill would prove delusive and although it professed to show justice to the natives, the spirit of monopoly would still blight the hope and break the spirits of the Indian people." Nothing was done to right the wrong till 1858 when Her Majesty proclaimed—

We hold Ourselves bound to the Natives of Our Indian territories by the same obligations of duty which bind Us to all Our other subjects, and those obligations, by the blessings of Almighty God, We shall faithfully and conscientiously fulfil.

And it is Our further will that, so far as may be, Our subjects, of whatever race or creed, be freely and impartially admitted to offices in Our service the duties of which they may be qualified by their education, ability and integrity duly to discharge.

But despite the Acts of Parliament and the solemn promises and pledges of Her Majesty the monopoly continued as also the obstacle to the Indian entering the service of his own country. An agitation was consequently set up and pressure was brought to bear upon the then Secretary of State for India to consider the gross injustice that was being done to the sons of the soil. As a result thereof a committee was appointed by the Secretary of State for India composed of the Members of his own Council. It presented its report on 20th January 1860. And the following are extracts from the same:—

It is obvious, therefore, that when the competitive system was adopted, it could not have been intended to exclude Natives of India from the Civil Service of India.

Practically, however, they are excluded. The law declares them eligible, but the difficulties opposed to a Native leaving India and residing in England for a time are so great, that, as a general rule, it is almost impossible for a Native successfully to compete at the periodical examinations held in England. "Were this inequality removed, we should no longer be exposed to the charge of keeping the promise to the ear and breaking it to the hope."

Two modes have been suggested by which the object in view might be attained. The first is, by allotting a certain portion of the total number of appointments declared in each year to be competed for in India by Natives, and by all other natural-born subjects of Her Majesty resident in India. The second is to hold simul-

taneously two examinations, one in England and one in India, both being, as far as practicable, identical in their nature, and those who compete in both countries being finally classified in one list, according to merit by the Civil Service Commissioners. The Committee have "no hesitation in giving the preference to the second scheme," as being the "fairest," and the most in accordance with the principles of general competition for a common object.

Be it confessed with shame and humiliation, this report, which did not suit the views of the Secretary of State for India and the bureaucracy of the day, was suppressed and put aside but was only brought to public gaze by private individuals. But the efforts of the small band of true and noble Englishmen, who were working earnestly and assiduously for the righting of the wrong, did not cease. In 1867 the East India Association urged on Sir Stafford Northcote who was then Secretary of State for India that "the Competitive Examination for a portion of the applicants to the Indian Civil Service should be held in India" and that encouragement should be given "to native youths of promise and ability to come to England for the completion of their Education" by the award of scholarships tenable for 5 years. While the Secretary of State was giving this scheme his consideration that warm and sincere friend of India the late Mr Henry Fawcett raised the question in the House of Commons and moved the following resolution—

That this House whilst cordially approving of the system of open competition for appointments in the East India Civil Service, is of opinion that the people of India have not a fair chance of competing for these appointments, as long as the examinations are held nowhere but in London; this House would therefore deem it desirable that simultaneously with the examination in London, the same examination should be held in Calcutta, Bombay and Madras.

The outcome of the petition of the East India Association, Mr. Fawcett's motion, and Sir Stafford Northcote's favourable reception of the petition was, that Sir Stafford Northcote introduced a clause in his Bill entitled "the Governor-General of India Bill" to grant the first prayer of the petition; and the Governor General, Lord Lawrence, published a Resolution on 30th June,

1868, to grant the second prayer of the Memorial, and some scholarships were actually commenced to be given but even the scholarships were soon abolished.

The clause introduced by Sir Stafford Northcote was passed in 1870 when the Duke of Argyll was Secretary of State and he communicated it to the Government of India by a special Despatch. According to the Act of 1870:—

"The Indians were to have a distinct proportion of appointments (which was fixed by the Government of India to be about one fifth, or about 7 every year) in the *Covenanted Civil Service*—which meant that in the course of 25 to 30 years, the duration of the service of each person, there would gradually be about 180 to 200 Indians admitted into the *Covenanted Civil Service*."

Needless to say this was too bitter a pill for the Anglo-Indian officials and non-officials to swallow. Every obstacle was placed in the way of giving effect to the Act of 1870. Documents favourable to Indians were suppressed, ignoble "subterfuges" were adopted, and the Government of India went so far as to suggest that Indians should be prevented altogether from entering the Civil Service and advocated a "Close Native Civil Service" and thus attempted by law to shut up the sons of the soil "in a lazaretto of a miserable close service."

In the face of these facts it is not strange to read that even Lord Lytton burst out:—

I do not hesitate to say that both the Governments of England and of India appear to me, up to the present moment, unable to answer satisfactorily the charge of having taken every means in their power of breaking to the heart the words of promise they had uttered to the ear.

It took nine years for the authorities to give effect to the act of 1870. Long and vexatious was the correspondence that ensued and the so called Statutory Service was launched in 1880—fully ten years after the act of 1870. The name Statutory itself "was unhappy" in so far as it tried to indicate as if the whole Covenanted Service itself was not statutory; and far-

sighted Indians ventured to suggest that a distinctive appellation like the Statutory Civil Service was deliberately given to it by the Government of India so that it may be regarded as a separate service and could therefore be killed with greater ease. "Killing it was evidently the object; for eventually kill it they did." And here one might incidentally observe that in discussing about the propriety of admitting natives to places hitherto held by the Civil Service, Lord Salisbury said:—

One of the most serious dangers you have to guard against is the possibility of *jealousy* arising from the introduction of Natives into the service.

The jealousy prophesied did make itself manifest at the time of the Ilbert Bill agitation. Lord Hartington in referring to it in the House of Commons (August 1883) exposed the true character of the Anglo-Indian agitation against the employment of Indians in the higher services.

I could quote passages in letters in the Indian papers in which it is admitted that agitation was directed against the policy of the Home Government in providing appointments for Native civilians while there are many Europeans without appointments.

It was on this occasion that Lord Salisbury made the confession that all the pledges and proclamations referred to in the course of the debate was all "political hypocrisy." To continue the woeful tale:

"The agitation against the Ilbert Bill subsided. The eruption of the volcano of the Anglo-Indian hearts stopped, but the anger and vexation continued boiling within as the cause of the explosion still remained." The design throughout was how to knock the "Statutory Service" on the head, and put down effectively the cry for simultaneous examinations.

It was at this juncture that the Public Service Commission was appointed "to devise a scheme which may reasonably be hoped to possess the elements of finality and to do full justice to the claims of natives of India to higher and more extensive employments in the public service." The portion of the public which were eagerly looking

forward to the Commission for the fulfilment of the pledges given them by the Sovereign and Parliament were doomed to disappointment. The Public Service Commission virtually echoed the views of the Government of India. It

pronounced itself against holding simultaneous examinations in England and India, and recommended that there should be two distinct services, one called the Imperial Civil Service, to be recruited in England by open competition as heretofore, and the other, the Provincial Civil Service, to be recruited in different Provinces partly under a system of competition and partly by promotion from the Subordinate Service. It recommended that about 108 specific appointments, i. e., about one-sixth of the appointments reserved to the Covenanted Civil Service in the Regulation Provinces, should be thrown open to and included in the Provincial Service, with which should be amalgamated the higher appointments in the Uncovenanted Service.

The Commission also recommended that the Covenanted Civil Service should be reduced to a *corps élite* and its numbers limited to what is necessary to fill the chief administrative appointments of the Government and such a number of smaller appointments as will ensure a complete course of training for junior Civilians.

The Government of India eagerly clutched at the recommendations of the Commission about the establishment of the two services—the Imperial and the Provincial and about the repeal of Sec. 6 of the Statute of 1870. But they declined to list all the higher appointments proposed by the Commission, such as the Membership of the Board of Revenue etc.

The Secretary of State, however, refused his sanction for the repeal of Sec. 6 of the Statute of 1870, or the revision of the Schedule to the Statute of 1861. But he sanctioned the main scheme of the Commission to have two distinct services.

In accordance with this decision, on the 22nd November, 1892 the rules for the constitution of the Provincial Service were issued and the Government of India went so far as to state that this "scheme was meant to be a final settlement of the claims of the Provincial Service and to be gradually worked up to within a generation of official life." The manner in which the case for the Indians for appointments in the higher public service was

seriously damaged by the orders finally issued on the report of the Public Service Commission has been well exposed by the Hon. Mr. Subba Row in his invaluable brochure on "The Public Service Question in India."

(1) We have, first of all, in spite of the Statutes of 1833 and 1870, the reservation of a particular class of offices to a particular class of persons recruited in England, mainly Europeans, constituting the Indian Civil Service and the perpetuation of a governing caste in India, against which the whole course of Parliamentary legislation has been directed since 1833.

(2) We have next the creation of an inferior service known as the Provincial Service, filled mainly by Indians, a service characterised by Mr. Dadabhai Naoroji, to whom we are all deeply indebted for his labours in this cause, as the *Pariah Service*.

(3) The Statutory Civilian, though on two-thirds pay, held an equal status with the members of the Covenanted Civil Service and had an opportunity to rise to the highest posts in the State, whereas the members of the Provincial Service were assigned a distinctly lower status in the service of the State, and they could not, under the rules, rise to any post higher than that of a District and Sessions Judge or District Collector, and these open places are very few, one-sixth of the former and one-tenth of the latter being listed.

(4) Further, under the rules of 1879, one-fifth of the annual recruitment in England could be made in India by the appointment of Statutory Civilians; whereas we have now a specific number of appointments listed as open to Indians. The number of appointments recommended by the Commission was about 108. It was reduced finally to 93.

(5) Again, if the rules of 1879 had been in force and the Commission had not been constituted, the number of charges available to Indians would have been nearly 165, which is one-sixth of 933, instead of 102 as now. The number of charges in 1832 when the Provincial Service was constituted was 840, and it is now 933; and yet there has been no increase of places listed in the different provinces.

(6) The differentiation into two distinct services has been carried out in almost all the special departments of the Public Service—Education, Public Works, Survey, Forest, Telegraph etc., one Imperial, mainly European, and the other Provincial, mainly Indian. In some departments, rules have been so framed as to keep back Indian talent from reaching the highest places therein and thus seriously injure the rights of Indians.

It is not strange, therefore, that even the late Mr. Salem Ramaswamy Mudaliar, the Madras Member of the Commission, confessed that "the net result of what the Secretary of State has done is to place us in a worse position than we occupied when the Public Service Commission was appointed."

The discontent caused by the result of the labours of the Public Service Commission grew

louder and louder and within a few years, some of India's good friends in Parliament brought the whole question of the employment of Indians in the higher services once again to the forefront. In 1893 Mr. Herbert Paul, M.P. succeeded in carrying the following resolution in the House of Commons:—

That all open competitive examinations heretofore held in England alone for appointments to the Civil Services of India shall henceforth be held simultaneously both in India and England, such examinations in both countries being identical in their nature, and all who compete shall be finally classified in one list according to merit.

The Secretary of state in forwarding the resolution to the Government of India took care to ask them to examine the question and state "under what conditions and limitations this resolution could be carried into effect." But he laid down the condition

that it is indispensable that an adequate number of the members of the Civil Service shall always be Europeans, and that no scheme would be admissible which does not fulfil that essential condition.

All the local Governments were against the holding of simultaneous examinations. The Madras Government alone in a singularly sympathetic and unique document said:—

"His Excellency in Council considers, therefore, that it is expedient to remove, by the institution of simultaneous examinations, the disabilities which now tend to hinder the entry of Natives into the Civil Service proper. This step will remove an injustice, or what has almost the same consequences, a feeling of injustice, and it will not endanger the British supremacy or impair the character of the administration as a civilised and enlightened Government. It may possibly, in certain circumstances, weaken executive action; but the disadvantages in this respect are not so certain or so grave as to outweigh the advantages. The increase in the proportion of Native candidates selected is, moreover, not likely to be so great as is supposed, and it would be advantageous to remove the dissatisfaction and discontent which undoubtedly exist among the Natives by some such measure as is now under discussion.

And so Mr. Paul's resolution which passed through the House of Commons was given a burial by the Government of India. The discontent and dissatisfaction was intense especially during the *regime* of Lord Curzon, and the authorities were openly attacked for deliberately trying to exclude Indians from all the higher

offices in the State. Lord Curzon thought it his duty to publicly deny this very serious imputation and availed himself of the budget debate of 1904 in the Viceregal Council to say that "not only were the people of this country not justified in complaining of exclusion from high office, but they were being treated with a liberality unexampled in the history of the world." Not content with this pronouncement he issued a special Government Resolution on May 24, 1904, in which he expressed his own opinion in the following words:—

There has been a progressive increase in the employment of natives and a progressive decline in the employment of Europeans, showing how honestly and faithfully the British Government has fulfilled its pledges and how untrue is the charge which is so often heard of a ban of exclusion against the natives of the country.

The general principles which regulate the situation are two in number. The first is that the highest rank of civil employment in India—those in the Imperial Civil Service, the members of which are entrusted with the responsible task of carrying on the general administration of the country—though open to such Indians as proceed to England and pass the requisite tests, must nevertheless, as a general rule, be held by Englishmen for the reason that they possess partly by heredity, partly by upbringing, and partly by education, knowledge of the principles of government, the habits of mind, and the vigour of character, which are essential for the task, and that the rule of India being a British rule and any other rule in the circumstances of the case being impossible, the tone and standard should be set by those who have created and are responsible for it. The second principle is that outside this *élite* the Government shall, as far as possible, and as the improving standards of education and morals permit, employ the inhabitants of the country, both because its general policy is to restrict rather than to extend European agency and because it is desirable to enlist the best native intelligence and character in the service of the State. This principle is qualified only by the fact that, in certain departments, where scientific or technical knowledge is required or where there is a call for the exercise of particular responsibility or for the possession of a high standard of physical endurance, it is necessary to maintain a strong admixture and sometimes even a great preponderance of the European element.

If Lord Curzon's dictum itself was unsound and opposed to all the Statutes, promises and proclamations, the figures that his Lordship manipulated to prove that there had been a progressive increase in the Indian element and progressive decline in the European element were grossly inaccurate, not to use a stronger word. The Hon,

Mr. Gokhale exposed the impropriety and the hollowness of Lord Curzon's contention. It was not difficult to shatter Lord Curzon's figures. The fact was Lord Curzon, to obscure the real issue in question, had included posts as low as Rs 75 a month to work out the percentage that he wanted. Mr. Gokhale pointed out that the complaint of Indians was in regard to their exclusion to high offices of trust and responsibility—say above Rs. 500 a month, and he showed conclusively by statistics that on the Rs 500 basis, Lord Curzon's statements were inaccurate and misleading. Amidst the many other grave administrative blunders committed by this masterful and imperious Pro-consul, that of attempting to belittle the character of the Queen's Proclamation was the gravest and the most unpardonable. It is not surprising, therefore, that even Lord Morley the then Secretary of State for India thought it his duty to condemn from his place in Parliament the attempt to read His Majesty's speeches in a "fettling spirit."

But the Indian public would not allow itself to be cowed down by Lord Curzon's pronouncement and the Resolution of his Government. The Hon. Mr N Subba Row took advantage of the reconstituted Legislative Councils and moved the following resolution in the Imperial Legislative Council on the 12th of March, 1911 —

That the Council recommends that a mixed commission of officials and non-officials be appointed to consider the claims of Indians to higher and more extensive employment in the public service connected with the civil administration of the country.

The Hon. Mr Richard Larle on behalf of the Government of India in a sympathetic speech admitted that there was *prima facie* a case for inquiry and assured that such inquiry would most certainly be made, but he was not for the commission proposed by the Hon Mr. Subba Row. But the country, however, had not to wait long for the Commission. On July 30th, Mr. Montagu made the welcome announcement in Parliament that His Majesty had been pleased to direct the ap-

pointment of a Royal Commission to enquire into the questions.

The terms of reference to the present Commission are as follows —

To examine and report on the following matters in connection with the Indian Civil Service and other Civil Services, Imperial and Provincial.—1. The methods of recruitment and the systems of training and probation. 2. The conditions of service, salary, leave, and pension. 3. Such limitations as still exist in the employment of non-Europeans, and the working of the existing system of division of services into Imperial and Provincial; and generally to consider the requirements of the public service, and to recommend such changes as may seem expedient.

We have traced at length the history of the vexed question of the share which Indians should take in the administration of their country with a view to show clearly and on official authority that as far back as 1833 it was clearly recognised that the system of competitive examinations held in London for the recruitment of the Civil Service does not at all give a fair opportunity to Indians to compete on equal footing with their English rivals, that all attempts made by good and well intentioned English friends in Parliament to treat Indians justly in regard to this matter have failed mainly on account of the hostility of the Anglo-Indian bureaucracy, that the Statutory Civil Service created in virtue of the Act of 1870 which attempted to rectify in a small measure the wrongs done to Indians has also been killed, and that the Public Service Commission of 1886 which was appointed with the express object of devising "a scheme which will do full justice to the claims of the natives of India to the higher and more extensive employment in the public service" has lamentably failed to fulfil the expectations formed of it; nay, on the other hand, it has taken away even the little that we possessed previously. It is sincerely hoped that the Commission which will shortly commence its sittings will face the question in a broad, statesmanlike and fair-minded spirit. Let us remember that the sharp distinction which at present exists between the Imperial and the Pro-

vincial Services is a thing not at all contemplated by the promoters and promulgators of the Acts of 1833, 1853 and 1870. This distinction brands the Provincial Civil Service with the bar sinister of inferiority; it makes them feel that they have absolutely no comradeship and equality in common with those who serve their Sovereign and their country; it makes them feel at the outset of their official career that in the administration of the country almost all the higher offices are denied to them.

The Provincial Civil Service scheme, the pet creation of the Public Service Commission, has been an entire failure and disappointment. The abolition of the Statutory Service has deprived the officer of the Uncovenanted Service of the one avenue by which he could enter the Covenanted. For, be it noted that under the Statutory scheme one sixth of the total number of recruits were to be appointed in India and this would have given an opening to a decent number of the berths in the Superior Civil Service; and even this, the Provincial Service has lost. It would be a mistake, however, to suppose that the loss has been only in regard to the opportunities for rising to the higher appointments. Under the Statutory scheme, its members were regarded as equals of the Civil Service men, were placed in the same gradation list and except perhaps in regard to pay, were in all other respects regarded as equals. The Statutory Civilian had the same opportunities, too, for promotion with his brother the competition-walla. But it is no exaggeration to say, that as things stand at present, exceptionally fortunate will be the individual who on the eve of his retirement succeeds in having acted as a Collector. That the Provincial Civil Service Officer is regarded as an inferior being is made more manifest still in sundry other ways. He gets less travelling allowance, less tentage allowance and in fact less consideration is shown for his

feelings and his conveniences. That this exceedingly unsatisfactory state of things has been acknowledged by the Government itself would be proved by the fact that in 1893 when the Madras Government gave its opinion in favour of the Civil Service Examination being held in India it urged among others the following grounds:

Another reason for altering the status and position of Natives in the Civil Service is to be found in the fact that the new Provincial Service does not in any way satisfy their aspirations and wishes. It is evident that its introduction on the present lines has been a great disappointment to them, that it has relegated them to a distinct and limited service, and instead of placing them in line with the rest of the Civil Servants, has confined them to what they consider an inferior and subordinate position, and that this has been accentuated by the designation which has been applied to them, a designation which they have always associated with a distinctly and well recognized inferior branch of the Service.

The distinction then between the Indian Civil Service and the Provincial Service must be knocked on the head. Our best interests and our self-respect demand that there should be only two services in the country, an upper and a subordinate service. The upper service, the present Civil Service to be recruited in England and India by the Examination being held simultaneously in both countries, the successful candidates being chosen in the order of merit irrespective of race or creed and the subordinate service being entirely recruited by Indians. But the reform should not stop here. We have also the "holy of holies" in the departments of Education, Public Works, Survey, Forest, Telegraph etc. In every one of these there is the Imperial branch designed for the European and the Provincial for the Indian. And here let Sir Valentine Chirol speak for the Educational:—

Before the Commission sat, Indians and Europeans used to work side by side in the superior graded service of the Department, and until quite recently they had drawn the same pay. The Commission abolished this equality and comradeship and put the Europeans and the Indians into separate pens. The European pen was named the Indian Educational Service, and the Native pen was named the Provincial Educational Service. Into the Provincial Service were put Indians holding lower posts than any held by Europeans and with no prospect of ever rising to the maximum salaries hitherto within

their reach. To pretend that equality was maintained under the new scheme is idle and the grievance thus created has caused a bitterness which is not allayed by the fact that the Commission created analogous grievances in other branches of the Public Service.

It is high time a determined effort is made to see "that the relationship between Europeans and Indians should be one of manly comradeship and co-operation, born of equal status and equal privileges" and not one of "timid dependence and sycophancy born of the relationship of superior and inferior." Let the motto for the future be "Common service, common emulation, and common rights impartially held."

This is the only path open to the Public Service Commission and it is undoubtedly the path of justice, the path of wisdom and the path of honour.

We do not believe that there is a single thoughtful Indian who contemplates the idea that Indians should swamp the services and drive Englishmen out from the offices altogether. Every far-sighted Indian is anxious that British supremacy should be continued and all reasonable safeguards provided for the maintenance of the same. But this does not justify the perpetuation of "a governing caste in India." The situation has been well grasped by Mr. Ramsay MacDonald—"The bureaucracy has taken root and grown thick in bole and branch where it was only meant to be a shade and protection for the tender plant of Self-government."

The first and the most effective step which ought to be taken to remedy the present undemocratic state of things is the abolition of the monopoly of the Civil Service by Englishmen, and the examination must be held in England and India simultaneously. The demand for simultaneous examinations does not owe its origin to the cry of the Congress agitator or of the liter-day product, the extremist politician,—for it must be remembered in fairness that the injustice of holding the examination in England only was discussed in the House of Commons in

1853, was condemned by a committee of officials of the Secretary of State for India's Council in 1860; and was recognised by the Madras Government as late as 1893, that the late Duke of Argyll admitted that "we have not fulfilled our duty or the promises and engagements we have made," and that Lord Lytton confessed that the authorities had been from time to time in regard to this matter adopting "deliberate and transparent subterfuges for stultifying the act and reducing it to a dead letter."

All the obstacles that at present stand in the way of the best and the first rate of our men from aspiring to the higher offices by the honourable door of competition ought to be removed. The Public Service Commission has a great and difficult duty to perform. The more extended employment of Indians in the services is not only an act of justice but "a financial necessity," to use the words of the late Sir W. W. Hunter.

This question of appointment to high offices, is, to us, something more than a mere question of careers. As Mr. Gokhale points out:—

When all positions of power and of official trust and responsibility are the virtual monopoly of a class, those who are outside that class are constantly weighted down with a sense of their own inferior position, and the tallest of them have no option but to bend in order that the exigencies of the situation may be satisfied. Such a state of things, as a temporary arrangement, may be accepted as inevitable. As a permanent arrangement, it is impossible. This question thus is to us a question of national prestige and self respect, and we feel that our future growth is bound up with a proper solution of it.

We would also remind the Commission that

a succession of great statesmen, who in their day represented the highest thought and feeling of England, have declared that, in their opinion, England's greatest work in India is to associate the people of this country slowly it may be, but steadily, with the work of their own Government. To the extent to which this work is accomplished, will England's claim to our gratitude and attachment be real. If, on the other hand, this purpose is ever lost sight of or repudiated, much good work, which has been already done, will be destroyed, and a position created which must kill all true well-wishers of both England and India with a feeling of deep anxiety.

INDIA'S MONEY IN LONDON.

Other loans to private firms.

£

[In response to a request by the Editor of the "Indian Review" the following opinions on the inflated Indian Cash Balances in London have been received.]

I. THE HON. M. DE F. WEBB.

THE total amounts of India's money that have been removed in recent years from India to London and there invested in securities, or deposited with or lent out to banks and others, exceed sixty crores of rupees, made up as follows:—

(1) From the Paper Currency Reserve.....
over twelve crores.

(2) From the Gold Standard Reserve.....
over thirty crores.

(3) From the Treasury Balances....
over twenty crores.

It is with regard to these last balances of over twenty crores that I understand that the *Indian Review's* enquiry has been made. The maximum sums lent out of these cash balances in London by the India Office to London borrowers during the past year have been as under:—

Lent out on deposit with no security.

£

To the—	
London County and Westminster Bank	... 1,800,000
Glyn, Mills, Currie & Co.	... 1,550,000
London Joint Stock Bank	... 1,500,000
National Provincial Bank of England.	... 1,300,000
Union of London and Smith's Bank..	... 1,250,000

Sums of over £1,000,000 lent to private firms.

£

Lent to—	
Samuel Montagu & Co	... 1,050,000
Nations' Discount Company	... 1,100,000
Union Discount Company of London.	... 1,150,000

Sums of 6,500,000 and over lent to private firms.

£

Lent to—	
Sheppards & Co.	... 500,000
Hobler & Co.	... 500,000
Chartered Bank of India, Australia and China	... 500,000
Brightwen & Co.	... 500,000
Alexanders & Co.	... 650,000
Reeves, Whitburn & Co.	... 700,000
Wedd, Jefferson & Co.	... 750,000

Lent to—

Allen, Harvey and Ross	... 100,000
Anglo-Egyptian Bank	... 200,000
Baker, Duncombe & Co.	... 200,000
Biedermann & Co.	... 100,000
Blydenstein & Co.	... 150,000
Booth and Partridge	... 150,000
Bristowe and Head	... 200,000
Roger Cunliffe, Sons & Co.	... 450,000
The Eastern Bank	... 100,000
J Ellis and Sons	... 200,000
Gillet Bros. & Co.	... 150,000
Haarbleicher and Schumann	... 150,000
King and Fox	... 200,000
Laurie, Milbank & Co.	... 100,000
Lazard Bros & Co.	... 250,000
Lyon and Tuckey	... 100,000
Matthey Harrison & Co.	... 100,000
Mercantile Bank of India	... 250,000
L Messel & Co.	... 100,000
National Bank of New Zealand	... 150,000
Ryder, Mills & Co	... 250,000
Henry Sherwood & Co.	... 50,000
Smith, St. Aubyn & Co.	... 250,000
Steer, Lowford & Co.	... 150,000
Tomkinson, Brunton & Co.	... 150,000

Well may the peoples of India feel amazed when they read this long list of cosmopolitan money-dealers who have been benefitting by the help of India's state funds.

In reply to your enquiry regarding the propriety of retaining India's large cash balances in London, I may point out that in my '*Britain's Dilemma*'—the book that has caused the attention of Parliament, the Press, and the Public to be directed to the India Office's recent management of India's finances and currency,—I have protested with the utmost vigour at my command against the constant transfer of India's cash balances to London which I consider to be very unfair to India, and altogether indefensible.

I have nothing to add to this opinion. I have seen no attempt at any defence from any responsible quarter except the Bengal Chamber of Commerce who appear to hold the view that so long as India is receiving 2 or 3 per cent interest on its money, it is of no consequence that the country has been over-taxed to yield these colossal cash balances, or that private borrowers in London should receive the benefit of a large supply of a cheap (Indian) capital rather than the peoples in India whose earnings have been reduced in order to provide this capital. Needless to say, I regard such a line of argument as preposterous. '*India's money for India*' should be the motto of all Indian patriots.

II PROF. V. G. KALE, MA.,
(Fergusson College, Poona.)

AMONG the many counts of indictment levelled by critics against the financial management of the India Office, one is the accumulation of unusually large cash balances in the Home treasury. In reply to a question put to the Under-Secretary of State for India in the House of Commons by the wonderfully indefatigable Mr. Rupert Gwynne, Mr. Harold Baker stated that the cash balances of the Government of India held in England on the evening of October 30 in each of the years 1908 to 1912 were as follows:—

1908	..	£ 1,198,691
1909	..	£ 5,003,988
1910	..	£ 12,711,748
1911	..	£ 15,207,580
1912	..	£ 9,229,797

Looking to the figures representing the balances for the previous years one is led to the irresistible conclusion that recently they have been abnormally high. The fact cannot, of course, be denied, but an attempt has been made to explain it away. It is apparent that a sum of about four or five millions should have sufficed in the Home treasury for ordinary purposes. When the cash balances mounted up year after year to unreasonably large proportions, people naturally felt that there was something wrong with the India Office system of financial management. It was clear that more money was being taken out of the pockets of the Indian taxpayers than there was a justification for the excess accumulated in the Secretary of State's treasury. This, of itself, could not, however, have raised against the India Office the ire of Indian and Anglo-Indian critics. The accumulation of heavy cash balances was only one of the sins with which the India Office was charged. The gravamen of the Secretary of State's offence was that he had placed himself entirely in

the hands of financial counsellors who dictated a policy which was antagonistic to the interests of India and was calculated to conduce to the convenience of the London banks, that the India Office had not been conforming to the recommendations deliberately made by the Fowler Committee and that therefore the present system of currency and finance was fraught with serious danger. The diversion of the Gold Standard Reserve and eight millions of the Paper Currency Reserve to London, and the locking up of the reserve in securities are measures which involve grave risk. Sir Edward Holden recently pointed out how meagre were the gold reserves of the Bank of England and the British joint stock banks and how in times of crises the Indian gold reserve in England would prove a broken reed. Sixty crores of India's money transferred to London and placed at the disposal of London banks on easy terms gives point to the criticism that Indian finances are being managed, perhaps unwittingly, by the India Office more in the interests of London banks than those of India.

Those immediately interested in these operations in India are particularly exasperated by the fact that while they have here to raise money at four to seven per cent, gold belonging to India is made available in London at very cheap rates. While the London houses and firms are being fed with the gold taken out of the pockets of the Indian taxpayers, Indian merchants and bankers are starved. This is a legitimate complaint to which the India Office has no satisfactory reply to make. The investing of the Gold Standard Reserve, whatever the profit it may bring in, is a huge mistake. It must be maintained in gold at any cost. I need not here consider if it should also be held in India and if the grievance on the part is only sentimental. Confining myself to the question of India's cash balances in London I am constrained to remark the lending out or depositing thirteen crores of India's superfluous

cash to banks or approved borrowers in England at 2½ per cent. as was recently the case to the great loss of the Indian taxpayer and the inconvenience of the Indian banker, does not speak well of the recent financial management of the India Office. From a statement furnished in the House of Commons we see that the excess of the proceeds of the sales of Council bills and telegraphic transfers over the net expenditure in London charged to revenue came to £25,055,839 during the three years 1909-12. Of this balance, £14,223,333 were added to the Gold Reserve and the Paper Currency Reserve. What is the propriety of transferring this latter to London it is difficult to understand. The reserve is obviously meant to redeem the Indian currency notes and if there is any place where it ought to be located, it is India. We are told that the Indian Paper Currency Act provides for the holding of securities and gold by the Secretary of State in Council as part of the reserve; and securities for £2,666,000 and £5,700,000 in gold are so held in England, the gold being in the custody of the Bank of England. This transaction lends strong colour to the impression that all available gold is being conveyed to London and is being placed at the disposal of the banks there. The paltry profit that may be derived is evidently no compensation for the risk involved. We are assured that the remaining 14 millions have been used gradually to discharge the floating debt and the permanent debt issued to provide for the annual capital outlay on the construction of railways and irrigation works. Yet at the end of last October the cash balances amounted to more than nine millions, half of what they were on 31st March.

Lord Inchcape has offered what he feels a satisfactory explanation of the accumulation of these balances. The principal cause according to him, seems to be the extra sales of Council bills and telegraphic transfers. There is, however, absolutely no necessity why the Secretary of State should

sell more bills than are needed to cover the Home charges. The requirements of trade is the usual answer. But the India Office is not bound to offer extra bills for sale nor are they really necessary, the defence of Mr. Montague in the House of Commons, notwithstanding. Lord Inchcape had no better justification to offer than that of the practice being an old one. Apologists for the Secretary of State have failed to convince the critics or to make out any plausible case. Apparently the position is indefensible. If so, the earlier it is overhauled, the better. At any rate, let us have a clear and authoritative statement of the aims, principles and operations of the Secretary of State.

III. THE HON'BLE. Mr. A. D. JACKSON.

In reply to your letter dated 2nd instant I am afraid I cannot claim to speak with any particular authority on the subject you refer to, and it is indeed difficult to express any definite opinion without *all* the facts. There is no doubt that in Commercial circles in India there is a strong feeling on two points, (1) that if at all feasible India's cash balances should be made available in this country for trade purposes and (2) that the fullest possible information should be regularly published by the Secretary of State showing what the Cash Balances are and where and how held. It may, I think, fairly be contended that trade in India should not have to labour under the high rates of interest usually current here for several months in the year, while large cash balances are held at home, either unemployed or earning a nominal interest, unless it can clearly be shown to be unavoidable.

THE ALL-INDIA SANITARY CONFERENCE.

BY THE HON. DR. T. M. NAIR, M.D.

A Conference of Sanitarians in India was a splendid idea. It was planted in Bombay last year. It blossomed in Madras this year. Mr. Surendranath Bannerji once said that "Madras miscalled the benighted Presidency was a source of living light to the sister presidencies." Madras certainly had something to do with the great success of the Sanitary Conference held here last month. And the other factor in the success of the Conference was its President—Sir Harcourt Butler. The discussions at the Conference covered a wide field. Town planning, water-supply, sewage disposal, plague, cholera, dysentery, tuberculosis, Malta fever, relapsing fever, enteric fever, milk supply, vital statistics, vaccination, inspection of food and drugs, dust prevention and many other interesting subjects were discussed. The delegates travelled all over Madras City to inspect its water works and drainage-works, its incinerators and its palatial hospitals, and even ventured as far out as Conjeevaram in the pouring, pelting rain to inspect the infiltration-galleries there.

A week of discussion and dinners, of tea and talk, kept the sanitarians busy and pleasantly occupied. Sanitary problems in India have been taken a stage nearer their solution and workers in the same field have been brought closer together. The subject of town planning naturally brought out the principle of "betterment," and incidentally demonstrated how good English principles are damaged in their transit to India. In England the local authority improves a locality at its expense and then steps in to claim its share of "unearned increments" from the owners of property which have appreciated in value by the improvement effected by the local authority. In the neighbourhood of Bombay it seems that owners of property are asked to pay down their

share of the expense for effecting improvements before any improvement works are undertaken. Under such a system there cannot be any "unearned increments," but on the contrary the increments are "hard earned." A compulsory system of improvement like that may be excellent for a body of capitalists, but is unsuited for municipal purposes. The conference wisely rejected the Bombay system and adopted the English principle of 'betterment.' This was not the only point on which Bombay enunciated unsound principles. On the question of financing water supplies Bombay recommended a new principle. Water is a commodity, said Bombay, and therefore sell it and make money. Do not impose a water tax at so many per cent on the annual rental value of buildings and lands but charge every house-owner who has a pipe connection two rupees a month or twenty four rupees a year. A tax of 24 rupees a year for water supply means a 6 p. c. tax on an annual rental value of 400 rupees. In other words, on that principle, the owners of all houses in Madras of a higher monthly rental than 35 Rs. will pay less water tax than they do now, and the owners of all houses of less monthly rent than 35 will pay more water tax. The Bombay system will overtax the poor and undertax the rich—which is absurd. *Q. E. D.* The Sanitary Conference would have nothing to do with it.

In the discussion on water supplies a good deal was heard about mechanical filters. The special pleadings that were advanced on behalf of the Jewell filters went a little too far and spoiled a good case. The controversy between Jewell filter and sand filter is an old one so far as Madras is concerned. When the question as to the kind of filters to be adopted for the Madras water works was under discussion in the Madras Corporation the writer of this article observed—

Sand filters were considered to produce their effects by acting as mere mechanical strainers. But recent researches both by chemists and bacteriologists, including

THE SNAKE CHARMER.

[The Hon. Sir Harcourt Butler presided at the second All-India Sanitary Conference held at Madras on the 11th Nov. and following days. In his inaugural address he said —It is no accident or idle chance that education and sanitation are united under the same department of the Government of India. Our first and signal objective is to educate the people as to the value and necessity of measures for protecting them in their homes and their lives and those dearest to them from the ravages of plague, malaria, cholera and other communicable diseases, and all the the miseries which follow in their train. * * * * * In recent years, by precept and example, the Government in India have done much to penetrate the mists of ignorance and prejudice which hide from the masses the blessings of sanitary science, the sources of law and order and happier conditions of society. In the last two years the Imperial Government has made grants for sanitation aggregating more than a million sterling, and in its anxious solicitude for the health and comfort of the people that Government has also recently decided to institute, in concert with Local Governments, comprehensive enquiry into the possibility of improving sanitary arrangements along pilgrim routes and at pilgrim centres.]

[The Hindi Punch.]

Dr. Koch of Berlin, have demonstrated the fact that sand filters are not mere mechanical strainers, but that water passing through slow sand filters undergoes a chemical as well as a biological change. This action is brought about by a layer of gelatinous substance which forms on the top of sand filters in which the microbes are arrested. Repeated experiments have proved that to develop this film of gelatinous matter to its proper degree water should be passed through the filters at a rate not exceeding 4 inches per hour. A greater speed retards the formation of the gelatinous matter and is inimical to the life of the bacteria which act as purifying agents. That is the principle of the sand filters. Now what is the jewell filter? In the jewell system of filtration a specified quantity of alum is added to the water which is turned into coagulating tanks in which the precipitate is deposited. The clear water from the tank is then decanted and passed rapidly through a layer of sand. This sand area, however, is so limited in extent and the water is rushed through by a process of suction action at such a tremendous speed that the formation of a gelatinous surface coating is an impossibility. The sand part of the jewell filter is admittedly a straining process. The purification of the water under this system is mainly due to the alum treatment which removes more than 75 per cent of the bacteria and deposits most of the inorganic solids. The difference between the jewell filter and the sand filter is this. In the sand filter a large enough area is provided to enable water to pass at such a slow speed as would form a gelatinous layer on top of it and purification is effected by the bacteria. In the jewell filter a very limited area of sand is provided and as the rush of water will not permit of the growth of the bacteria in the surface layer the alum treatment is introduced as substitute for the bacterial treatment in slow sand filters. In the one case the purification is by chemicals; in the other it is by bacteria—the latter being a natural process, and the former an artificial one. Artificial processes are only availed of when natural ones cannot be utilized from some cause or other. The genesis of the jewell system of filtration will be found in over crowded cities, turbid water supplies, and low atmospheric temperature. In large and growing cities where the cost of land is prohibitive it may be almost impossible to find the necessary space for slow sand filters and the jewell filter with its limited space requirement may have to be preferred. Or again, where the water supply is from an exceedingly turbid river like the Nile, the sand filters may be very soon choked and rendered useless if the water is not subjected to a previous process of sedimentation or precipitation. Those are conditions under which the jewell filter may be of service and hence its use in Alexandria and other Egyptian towns. Then again in a cold climate where the temperature in winter is very low the extensive areas of sand filters if left uncovered will cause the water to freeze and the work of the filter will be at a stand still. There you have a condition where the jewell filter located inside a building has its distinct advantage over its more natural rival. But these are all conditions under which the jewell system has to be had recourse to because the natural system of sand filtration is almost impracticable.

There is nothing very new to be said about plague, cholera and the other diseases with the prevention of which sanitarians have to deal. But the importance of flies as carriers of disease was pre-emi-

nently brought out. It was also made very very plain, indeed, that the system of plague prevention as practised in Madras where attempts are made to control the spread of the disease by controlling the human agency was practically useless. It remains to be seen whether the Madras Government will accept the opinion of the expert body and divert its plague expenditure into more scientific and rational channels.

Have sanitarians ever met in conference anywhere without an animated debate on sewage disposal? And will they ever agree as to which are the best incinerators for practical use? But Madras was able to show them something very highly useful and practical in the incinerator line. The "Griffith incinerators" as used in Madras were greatly discussed and appreciated. And so were the Madras ideas about the control and improvement of cattle yards and the construction of model cattle yards as factors in the improvement of milk supplies. The appointment of medical men as registrars of births and deaths was another Madras idea which was commented on with approval.

The venerable figure of Mr. Moti Lal Ghose, the veteran editor of the *Amrita Bazar Patrika*, was very much in evidence. He was a delegate to the Conference and was a special advocate of the claim of the Rural population. He was quite right. The population of India is mainly rural. The total population of all the towns of over 10,000 inhabitants only makes less than 8 per cent. of the total population of British India.

Mr. Moti Lal Ghose was indeed right in asking the Conference not to forget the interests of 92 per cent of the population in their anxiety to safeguard the welfare of 8 per cent. It has been said that 'brevity is the soul of wit.' It certainly was the soul of scientific sanitary discussion as seen at the Sanitary Conference. The All India Sanitary Conference can teach the many other conferences in India something more than sanitation.

MAZZINI AND YOUNG INDIA

BY

THE REV W. E. TOMLINSON.

THE general estimate in this country of the teaching of Mazzini is that it is "against the Government." So gravely was his message misunderstood and misrepresented a few years ago in one part of India that a so-called "Life of Mazzini" in the vernacular met with the only fate possible to such a caricature, and was proscribed by the local Government. An English gentleman said to the writer recently that he thought Mazzini the last subject on which it would be advisable to lecture to an educated Indian audience. Happily we are in a very favourable position to day to enquire whether or no Mazzini has any message for Young India. The standard English "Life" by Bolton King, which contains an excellent summary of Mazzini's teaching and on which this paper has largely drawn, is now available in "Every Man's Library" at one shilling. In the same series is "The Duties of Man," a book of tremendous moral force. There is another collection of Mazzini's essays in the Scott Library at eighteen pence, while Mrs Hamilton King's "The Disciples," a poem treating of Mazzini and his followers, and "Vittoria" by George Meredith, a novel dealing with Mazzinian times, are to be had in cheap editions. Mrs Hamilton King has, in extreme old age, recently published a touching tribute to her "Master" in her "Letters and Recollections of Mazzini," which, as Mr. G. M. Trevelyan says in his Foreword, is "a peculiarly genuine and personal record of the more intimate side of Mazzini's life during those sad latter years when his cause was triumphing in the eyes of others, but not in his own." In some of our city libraries may be found one or more of Trevelyan's three

fascinating books on Garibaldi, the "Defence of the Roman Republic," the "Thousand," and the "Making of Italy," all of which are of value in a study of Mazzini, the soul of the New Italy, as giving a view of him from the position of an ardent admirer of Garibaldi, her Sword. The biographers of Cavour, Italy's Brain, could hardly be expected to wax enthusiastic over Mazzini, for he almost always misunderstood the great statesman without whom prophetic idealism and soldierly courage would have been wasted. Yet even the Countess Cesaresco's monograph and Thayer's recently published monumental "Life of Cavour" add to one's knowledge of Mazzini by references none the less valuable because dispassionate. The present article is not an attempt to outline Mazzini's life, to delineate his character, or to summarize his teaching. It will suffice if we note some points in that teaching which are not without their bearing on our lives, whose lot is cast in modern India.

It may well be said at the outset that Mazzini's message to Young India would not necessarily be the militant one he addressed to Young Italy. That the political condition of Italy in 1848 was far different from that of India in 1912 should not need much proof. In 1848 Italy was the merest "geographical expression." Austria held Lombardy and Venetia. Piedmont, under a King of the old line of Savoy, ruled the North-west. A Bourbon king governed Naples and the South. In the centre were several petty dukedoms, and the Papal States, the sphere of the exercise of Rome's Temporal power. Of all these Austria was paramount. Lombardy and Venetia were ruled by a viceroy, a puppet whose strings were pulled in Vienna, whither all business was referred. This meant intolerable delay in the prosecution of public affairs. A quarter of the products of these provinces was seized in taxes, and there were additional imperial dues. The

dictum of the sovereign, "I require obedient subjects and not enlightened citizens," fairly represents the attitude of Austria to Italy, though it fails to do more than suggest the barbarities to which the rulers had recourse to secure obedience in the ruled. Austria's was a government by bayonet; its aim was to perpetuate, by whatever physical violence, the servitude of Italy, whose children were taught in the politically managed schools that "subjects should conduct themselves as faithful slaves." A rigid censorship went so far as to correct Dante for political ends, and educational chairs were held by mere charlatans, tolerated because they were good servants of the Austrian overlordship.

In Naples Ferdinand IV, whose rule Gladstone denominated "a negation of God," had made promises of freedom to his people and had even declared a constitution, but his secret dependence upon Austria made these of less value than the paper that bore them. Of all the ill-governed countries of Italy the Papal states were easily worsted. The Temporal Power was a proof on the plane of history of the truth of the saying of Browning's Pope

"This is the man proves irreligious
Of all mankind, religion's parasite."

The rule of the Papal States was blind, greedy, capricious. Only two per cent. of the people could read, and education was in Latin from suspicion of modern knowledge. From 1818 to 1848 there was neither personal safety nor justice in Rome. The judges were corrupt and the 80,000 laws they administered were barbarous. Imprisonment depended on the whim of Government. The prisons were filthy. Assassination was rife and was winked at by the authorities. Spies were the curse of the country, recalling the French Revolution, as the system of torture in vogue brought back the days of the Inquisition. "The San-Fedists who protected the Holy Faith,

sometimes by the dagger at midnight, sometimes by open ruffianism in the broad day, were permitted by Government to beat or kill at their pleasure any man dubbed Liberal, Freemason, or Carbonari, until to neglect attendance at mass, or even to grow one's beard, was enough to expose one to assault by these braves."

Enough has been said to justify our protest against the assumption that has sometimes been made, that similarity in the political condition of the two countries warrants the application to modern India of Mazzini's call to war against the ruling power in Italy. We will only further note that Mazzini himself most emphatically repudiated that "doctrine of the dagger" which he has been made to preach in this and other lands. To Cavour, who charged him with plotting against the life of king Victor Emmanuel, the Piedmont Sovereign who was to reign over a united Italy, Mazzini indignantly replied that the king's life was "protected, first by the existence of a constitution, next by the uselessness of the crime." He "abominated" political assassination and declared it to be "a crime if attempted with the idea of revenge or punishment; a crime when there are other roads to freedom open." During the days when as Triumvir he presided over the defence of the Roman Republic, he ruled Rome without prisons, without trials, without violence and that in an age when assassination was common. That the aforementioned Local Government, in proscribing the vernacular pamphlet on Mazzini, which cited his work in Italy as justifying bomb-throwing and mob-law in India, was right both historical fact and Mazzini's own solemn declaration bear witness.

It is easier to make the denial of the preceding paragraphs than to say what would have been Mazzini's positive political or social propaganda for Young India. Mazzini was too inconsistent and too obstinate ever to be a great thinker or a constructive politician. He was above all a seer,

an idealist. Brilliant flashes of intuition shine from out his speeches and essays and letters, and he never fails to nerve to their task men who have a hard piece of work to do, but politician he was not. The way in which he held doggedly to his idea of a republican Italy when even his closest friends saw that the unity to achieve which he desired a republic could only be gained by making Italy one under Victor Emmanuel, is sufficient sign of his limitations as a practical politician. It is not a programme that Mazzini has for India so much as a message.

In all his advocacy of Republicanism Mazzini had three great ends. In the first place he pleaded for a Republic because through it he hoped to see Italy the home of *true freedom*. Liberty was the thing dearest of all to Mazzini but by liberty he did not mean mere political independence. The liberty he advocated only held the place it did in his scheme of the State because it was the necessary condition of morality and of true progress. "Where liberty is not, life is reduced to a simple organic function. The man, who allows his liberty to be violated, betrays his own nature, and rebels against God's decrees." Some of the practical inferences from Mazzini's doctrine of personal liberty will be suggested in the later paragraphs of this paper. for the present we may note that he limits liberty in two ways. No liberty is worth the name that works immorality or that profits the individual to the hurt of the society.

In the second place, and to achieve this desired liberty, Mazzini insisted on *association*. Men, though free, are powerless save in combination. "Association multiplies your strength a hundred fold; it makes the ideas and progress of other men your own; it raises, better, hallows your nature with the affections of the human family, and its growing sense of unity." The republican formula to which Mazzini committed himself was "everything in liberty through association."

These two great and complementary ends Mazzini would have brought about by *national education*. What manner of education he would have imparted may be gathered from his answer to one who asked him how, given a republic, he would free his people. "Mazzini replied, 'Establish schools, in which the duties of man, sacrifice, and devotion would be taught.' " Had we had his promised look on education we should have known better the lines along which he would have taught his people the truth which was to make them free.

It was because Mazzini believed that nothing but a republican government could secure such education and the consequent freedom and association, that he cried day and night for a republic. In a note written to his old friend Bertaino, when the latter was Garibaldi's agent in Genoa, Mazzini says, "I have no republican intentions. I strive for nothing but the Unity. The cry *Viva la Repubblica* would seem to me a real mistake at the moment." It is of prime importance in applying Mazzini's message to other countries to note that the form of government was nothing to him, if only true liberty and helpful association could be won.

At the back of Mazzini's thought of the threefold gain that would accrue from a Republican Italy, lies his conception of Nationality. Humanity is too wide a thought, he would declare, to thrill men. God, who set the solitary in families, has united families into nations. Humanity is the army of which nations are the battalions. Mazzini refused to admit race as one of the chief bases of nationality. "There is not," he said, "a single spot in Europe where an unmixed race can be detected"—so that he would not have despaired of seeing the vast congeries of the races of Hindustan knit into a single national life. He knew how great a power language and literature have in uniting a people, (Dante was one of the most potent of the influ-

ences that determined the course of Mazzini's own life's work); but he would not make of them the essence of nationality. Geography was the sole science that interested him, and every Indian will agree with Mazzini that the course of rivers and the disposition of mountain ranges have no small share in the fixing of a people's national characteristics; but geographical relations were, to him, only formative of, not vital to nationality. War he knew had often had a welding influence, and to this the history of British India surely witnesses. But to Mazzini all these forces only affect the shell of nationality: its kernel, its spirit, its essence consist not in them. "Nationality is a sentiment, a moral phenomenon, which may be generated by material causes but exists only by virtue of moral facts." Greater even than the popular will, as a factor in the essence of nationality, is this, that "nationality must have a moral aim to justify it." "Country is not a territory: territory is only its base; country is the idea that rises on that base, the thought of love that draws together all the sons of that territory." And again, "a community of men drawn together by a selfish principle for a purely material purpose is not thereby a nation. To constitute a nation, its informing principle and purpose and right must be grounded on eternal bases. The purpose must be essentially a moral one."

"The Duties of Man" shows how high an ideal of patriotism Mazzini had. "No ill-living man was a true patriot." "Where the citizen does not know that he must give lustre to his country, not borrow lustre from it, that country may be strong but never happy." No braggart is a patriot after Mazzini's heart. "Flattery will never save a country nor proud words make us less abject. . . . The honour of a country depends much more on removing its faults than on boasting of its qualities." To

Mazzini patriotism was not a regard for the greatness of a country's past: it was a supreme concern for its present moral integrity. Only righteousness exalts and only moral corruption destroys a nation. Hence the need for a pure national life and an unselfish and honourable international life. In regard to the latter Mazzini believed that every nation had its divinely appointed mission in the world. "God has written one line of his thought on the cradle of each people." "He believed Italy's work to be—unity within herself once achieved—to lead the severed nations of Europe and the wider world to a moral unity, an end that Italy, of late months, has done little to forward, but that is doubtless the nearer for Mazzini's upholding of his ideal.

It is to this test, Does it knit my nation into a moral unity, promoting freedom, while making for an association intimate and fruitful of general good? that Mazzini would have us bring every institution of our several lands. He said once "There is no such thing as a purely political or purely social revolution; every true revolution has at once a political and social character," and to his test for forms of Government he would refer all social and religious institutions too. The writer once lectured on Mazzini in a South Indian city, and in his closing address the chairman, an Indian gentleman of some freedom of thought and speech, said that, were Mazzini to appear in India to-day his bombs would be directed not at the British but at Caste, while one would certainly be placed under his grandmother's bed! That was a broad way of saying, what is certainly true, that of every ancient institution, Mazzini would ask whether or no it was knitting the people (not of a section of society but of society as a whole) into a unity in which personal liberty was secure, a unity moral and saving. "So long as revolutions lead only to the sub-

stitution of one aristocracy for another, we shall never find salvation." Apart altogether from the religious sanctions or philosophical supports of these institutions Mazzini would judge them solely by their moral effects, their power to free, to unite, and to save the nation and through it the world. This is perhaps Mazzini's clearest call to India to-day, to apply this test unflinchingly and universally. In this message he has left us a legacy more valuable than the most detailed political and social propaganda.

In regard to the manner of our applying such a test Mazzini's own strenuous life story seems to me to indicate two things that he is, in effect, saying to public workers in India to-day. The first is, *Be passionate*. Whether we are in the van or form the rank and file of the army of progress and reform we need the passion, the suffering of soul, of the "Father of Italy" of whom Swinburne says.

"He found

Her weak limbs bared and bound,
And in his arms and in his bosom bore
And as a garment wore
Her weight of want, and as a royal dress
Put on her weariness"

Again, does not Mazzini's life of martyrdom say to us, *Be consistent*? One of Mazzini's most urgent demands of workers for the people is that they should above all be true. Mazzini believed in association, but he passionately declared that there are some liberties that no association has any right to curtail. "No majority, no force of the community may take from you what makes you men." What no association has the right to do, fear and convenience must not be allowed to do. The preachers of the rights of nationality and of freedom must before all else unflinchingly fulfil, at whatever cost, men's fundamental moral duty of consistency.

Mazzini in his later days used to say that the star mostly in the ascendant in his life was the

Digitar, and that his own "bark" was generally unheard. There are few more pathetic figures than the Mazzini of those closing years, oppressed by the sense of the failure of his most cherished plans. For all his depression over personal failure, Mazzini was one of the truest optimists that Europe has known. Nothing could dim his vision of Rome, purified, in spiritual headship over a world made free through her sacrificial labour. He once confessed, "In my heart I have said, it is not possible that the city that has already lived to see two lives should not arise to see a third. After the Rome of conquering soldiers, after the Rome of triumphant Word, there shall come the Rome of Virtue and of Example; after that of the Popes, shall come that of the People." Let every Indian worker, who finds it hard to believe day by day that for his country the best is yet to be, remember that what kept Mazzini hopeful was his religion, his faith in God.

The age in which Mazzini lived was not a religious, or rather not a godly, age. The curious might, perhaps, discern certain resemblances between the religious life of awakening Italy and that of modern India. The French occupation of Romagna had scattered the seeds of scepticism, and these had yielded a crop over a far wider field than had been sown. The scientific ideas of the Encyclopedists had become known to the educated classes, who in the Papal states were restive under an ancient priestly ruler. Religious obedience was by no means voluntary. It was no change for the better to be delivered from Austrian violence to suffer the moral compulsions of the Temporal Power. Garibaldi and his soldiers, as Trevelyan shows, had a kind of "physical horror" of the priests of the reactionary party. But the poorer people of the villages were as innocent of religious ambition as of political, and many a hamlet in the Umbrian Apennines would have been loth to lose the rule of the priests, for

all its lording of it over them. Simple devotion to the person of the Pope and a fondness for sacred pomp combined to keep the peasantry loyal to the Roman States. Nor was it otherwise with the lower classes in the cities, notably in Rome itself. "As long as they were able to enjoy the spectacle of fireworks and balloon ascensions, as long as the Pope authorised the Carnival orgies and October beanfeasts, with their almost pagan rites, and as long as the subventions passed on by the convents and the houses of the Cardinals to the indigent classes were sufficiently substantial, they were satisfied." For many of the educated in the cities doubt had sapped the foundations of belief for most of the poor, in town and country alike, religion had ceased to be a thing of solemn Karma and was become a *tanisha*. *Mutatis Mutandis* the religious unrest of the educated and the religious stagnation of the common people of Mazzini's time have their counterpart in India to-day.

In such an age it was hardly to be wondered that Mazzini was not an orthodox Christian. The only Christian life he saw was corrupt: but he had as the centre about which all his work, political, social, and literary turned, a deep religious consciousness, an immovable faith in God. To use his own words, religion was to him "the eternal, essential, indwelling element of life." His religion was so vital that it could not be kept out of any part of his work. Of great importance for all workers in the fields in which he toiled is his word, "I do not know, speaking historically, a single great conquest of the human spirit, a single important step for the perfecting of human society, which has not had its roots in a strong religious faith." He had proved that not materialism, not ethics, not philosophy can either liberate a nation or make it one. That is religion's work. Though Mazzini did not find his spiritual home

in orthodox Christianity he had a deep reverence for Jesus Christ. There is a letter of his in which he says, "I love Jesus as the man who has loved the most all mankind, servants and masters, rich and poor, Brahmins and Helots and Pariahs." Jesus had freed the individual, had come as the Apostle of the Unity of Law and as the Prophet of the Equality of Souls. Whatever his doctrinal confession, Mazzini's ethics and his spirit of sacrifice were Christian through and through. He believed in the supremacy of the spiritual, in God as personal, and in Providence; he practised and appealed for self-sacrificing love, of which "one true, immortal virtue" the cross was his symbol; he never relinquished his faith in immortality; and he longed for one universal and spiritual and all fulfilling Church. His later aspirations after a "Supreme Council" to decide the common truths and duties of the peoples are only an instance of the way in which the mystic in him blundered over the practical; but his demand that religion shall be the soul and the thought of the State and of political and social movements is universal in its scope and eternally applicable. Young India, he would say to us, no less than young Italy, must be religious, for "political parties fall and die; religious parties never die till they have conquered."

Religion for Mazzini was nothing save as it issued in duty. In "The Duties of Man" his repeated message to the working-men of Italy is that duties must be discharged before ever the question of rights can be discussed. Rights! "Man has one right only, to be free from all obstacles that prevent the unimpeded fulfilment of his duties." "The earth is our workshop; we may not curse it, we must hallow it." Life is no path to mere happiness whether "by railway shares, selfishness, contemplation," or anything else. Life is a mission, a call to make ideals real, a gift to be used for the good of the race, an "undying battle" with Evil whose "dominion we are

everlastingly to weaken." We are to do this by incarnating our ideas in deeds, for "every thought, every desire of good, which we do not, come what may, seek to translate into action is a sin." And in this toil and in this fight man is always to remember that he is not alone, God is with him. Duty "borrows from the Divine nature a spark of its Omnipotence." Further, Duty has conscience as guide. Mazzini somewhere finely says that Truth lies at the intersection of conscience and tradition. Duty is the realizing of Truth, and one knows one's duty by the voice of conscience and the testimony of "the mass of would-be moral men" checking each the other.

In the fulfilment of duty Mazzini's great support was prayer. In one of his most characteristic letters in Mr King's collection, he says, "Is a thought, a fervent wish, arising in a pure soul, powerless on other souls, because it does not embody itself in a terrestrial reality? Only God is all powerful; Thought in Him is identical with Action. Every Thought in Him is a Creation. We attempt when He achieves; we wish when we cannot attempt; and I write the word *wish* because wishing is action too." Now, prayer is wishing in the line of God's Thoughts, till those Thoughts become palpable to us as actions on the plane of our existence. Mazzini did a good deal of such "wishing." He was not ashamed to confess that he believed in the power of prayer. "I was during one whole hour at a loss what to write till my soul melted away in prayer." It is because Mazzini as a religious man and a praying man joined himself to the powers of endless life, that of all the influences that went to the making of Italy, his will be the most lasting, and the most powerful over the widest range. From the mind of the peasant of the plains and valleys of Italy as he tills his fields and prunes his vines the memory of Garibaldi, the simple and lion-hearted lover of his Homeland, will not soon fade; students of international diplomacy may declare Cavour the greatest states-

man of his century; but to us with our share to take in the unifying of a people or the freeing of a society, the lofty idealism and the pure, prayerful faith of Mazzini will prove the mightiest inspiration and will afford the most constant help. What the author of "The Disciples" makes Mazzini's spirit say to toiling men is the message he has actually brought to many:

"Facing the foreseen doom ye know,
Through flesh and soul's extremity,
Fight on, and keep your heart alive!
I have gone through where ye must go,
I have seen past the agony,
I behold God in Heaven, and strive."

Indian Political Literature

Essays in National Idealism.—By Dr Ananda K. Coomaraswami with illustrations. Rs. One. To Subscribers of the "Indian Review," As 12.

Morley's Indian Speeches.—With an Appreciation of Lord Morley, a full A. Portrait, Crown 8vo. 240 Pages. Rs. One. To Subscribers of the "Indian Review," As 12.

Gokhale's Speeches.—With a biographical sketch and a portrait. Over 1,000 pages. Crown 8vo. Rs. 3. To Subscribers of the "Indian Review," Rs. 28.

The Indians of South Africa.—By H. E. L. Polak. Rs. One. To Subscribers of the "Indian Review," As 12.

Dadabhai Naoroji's Speeches and Writings.—With a portrait. Rs. Two. To Subscribers of the "Indian Review," Rs. 18.

Glimpses of the Orient to-day.—By Saint Nihal Singh. Price Rs. 1. To Subscribers of the "Indian Review," As 12.

The Indian National Congress.—An account of its origin and growth. Full text of all the Presidential Addresses. Report of all the Congress Resolutions. Extracts from all the Welcome Addresses. Portraits of the Congress Presidents. Over 1,200 pages. Crown 8vo. Rs. 3. To Subscribers of the "Indian Review," Rs. 28.

Indian Military Expenditure.—By Mr. Dushaw Edulji Wacha. As 6.

Recent Indian Finance.—By Mr. Dushaw Edulji Wacha. Price As 4.

Indian Railway Finance.—By Mr. D. J. Wacha. As 4.

NIZAMI'S "HAFT PAIKAR."

BY

MR. H. BEVERIDGE, I. C. S. (*Retired.*)

THE *Haft Paikar*, or, "the Seven Beauties" is one of the five metrical romances of Nizami, a Persian poet who preceded Chaucer by nearly two centuries. It has been aptly said by Hammer Purgstale that the *Haft Paikar* might be called the "Magazine of stories," just as Nizami called an earlier work the "Magazine of Mysteries." It is one of the earliest of poetical story-books, and has often been imitated.

The frame-work is simple. Bahram Gor, who is a historical personage, and was king of Persia in the fifth century A. D., finds in a hidden room of his treasury the portraits of seven princesses. They are all kings' daughters and one of them is Furak the daughter of the Rai or sovereign of India. Her name is evidently a derivative from Fur or Pur, for F is the Arabic equivalent of the letter P, and so her father is to be regarded as the King of Kanouj and as a descendant of the Porus of the Greeks. The other six portraits represent the other countries of the world, one being of the daughter of the Greek Emperor, another of the daughter of the Czar of Russia, and so on.

Bahram falls in love with all the seven, and by sending ambassadors and presents he obtains them from their fathers. He then builds a palace with seven domes, corresponding to the seven planets, that is, to the Sun and the Moon, and the five planets known to the Orientals, and also representing the seven days of the week. Each bride is installed under one of the domes, and each building is decorated in the colour appropriate to its planet. Thus Furak's dome is coloured black, as representing the day appropriated to Saturn. Bahram having clothed himself in black, begins his week of visits by going to Furak's mansion on the Satur-

day, and requests her to tell him a story. She relates one, descriptive of a city where all the inhabitants are Siahpesh, or wearers of black, and of the adventures of a traveller who goes there, and embarks in a flying basket, and afterwards binds himself to the leg of a Simurgh, that is, the Roc of the Arabian Nights. Next day he visits Humai, the daughter of the Greek Emperor. It is Sunday, and so her dome is coloured golden, and Bahram wears a yellow dress, and has a gold crown on his head. Humai tells him a story, and in this manner he goes the round of all the domes. The fourth tale is related by the Russian Princess, and is about a king's daughter who shuts herself up in a remote and wonderfully guarded fortress, and dares her lovers to come and find her. Of course, "the many fail, the one succeeds," and an adventurous prince, with the Simurgh's help makes his way into the castle, answers the princess's riddles, and wins her for his bride. This story is full of incidents and became popular in Europe and has been translated into German by Erdmann. But I think that Humai's story is the most interesting of the seven tales. It is the only one in which the characters excite sympathy. It is the tale of a Persian king and a beautiful slave. The king is wise and handsome, and amorous as the day. But he knows from his horoscope that association with womankind will give him trouble, and so he keeps aloof from them, as long as possible. But nature is too strong for him, and as he cannot find a suitable princess (*khatun*), and is also afraid to form a permanent union, he has recourse to the purchase of slaves. An old hunchbacked woman, who acts as his broker, keeps him supplied, but the result is not satisfactory. Though the old woman vaunts each purchase as coming from the harems of King David or of Mahmud of Ghazni, the king is disappointed, and sells each new arrival after a week or less. In this he is encouraged by the broker who finds her profit in the frequent commissions. At last a report comes

that a Chinese slave dealer has arrived with a thousand beauties, the pick of Kballaj and Cathay. Among them is a peerless fair one who has absorbed the light of the Morning Star. The king sends for her and for her companions, and she is the only one who attracts him. He finds her even more beautiful than report had made her, and falls in love with her. But he is cautious and asks the slave dealer about her accomplishments and her character. He vouches for her moral and mental excellences but admits she has one great drawback. This is, she has no inclination for men, and that every one who tries to possess her is repelled by her, and endangers his life. Hence, whoever purchases her, returns her the next morning. The dealer says he has heard that the king is as hard to please, as the girl is, and so suggests that he should not purchase her but choose some other lady from his stock. The king, however, will have none but her, and she is placed in his harem, where she remains like a lovely flower in its sheath, shunning publicity, and courted retirement. Though the king makes advances to her, she shows no response. The old brokeress tries to smooth matters, but both the King and the girl resent her interference, and she is turned out of the palace.

One evening the King addresses her in terms of passionate admiration, calls her the eyes of his life, and the life of his eyes, the Cypress formed one, the beauty compared to whom the spacious basin of the Moon is a narrow ewer, and asks why she is so cold to him. He then invites her to speak freely to him, and to tell him her whole mind, and as an encouragement to do this he relates to her a story about Solomon and Bilkis, the Queen of Sheba. Bilkis, he said, gave birth to a man-child, but to the grief of the parents he was born without hands or feet, or rather, perhaps, without their being attached to the trunk. Solomon applied to the Archangel Gabriel to know what was the cause of this calamity and what was the remedy and was told that the child would recover

his limbs, if both Solomon and Bilkis would answer with perfect sincerity the questions that were put to them. The question put to Bilkis was somewhat like that put to Draupathi in the Mahabharata, and was, with all her love for Solomon and admiration of his grandeur, if she had not occasionally an inclination for other men. Bilkis thereon acknowledged that she never could see a handsome young man without feeling an inclination for him, and her honesty was rewarded by her child's getting the use of his hands. The question put to Solomon was if in spite of all his greatness he did not covet more things. He replied that, wealthy and powerful as he was, he never saw a man approach his throne without looking to see if he had a present for him. In reward for this sincerity the child got the use of his feet and rose up.

After telling this story, the king invited the girl to speak the whole truth and to tell him, as in the presence of God, why with all her beauty she was so cold towards him. On his part, he could not keep feeling intense love for her even when he saw her afar off! Thus adjured, the girl explained that in her family (*nasl*, which perhaps means sex here) when a woman gives her heart to a man, she soon dies in child birth, and she asks, in anticipation of John Stuart Mill's question, if men had to bear children to women, would they have the courage to run the risk of death? Why should women eat poisoned honey. "My life," she says frankly, "is dearer to me than that I should expose it to such danger. I am a lover of life (*jan*), not a lover of lovers (*janan*)." As she has disclosed her secret, in other words, "has taken the cover off the dish," let the King discharge her or sell her. But, as she has unveiled her heart, she trusts that the king will not hide his own feelings and tell her why he so summarily gets rid of so many beautiful women, why he does not give his heart to any of them, why he does not even keep them for a month, but treats them like a

lamp or a candle, to be cast aside with contempt when no longer serviceable. He replies by a bitter attack on women. He says, none of his women has any regard for him. They only think of their own interests. They affect to be good, but really are bad. When once they are made comfortable, they cease to do any service. Every one must act according to his or her nature. Flour of the wheat is not suited to every one's stomach. No reliance can be placed on woman. She is straw and carried about by every wind. If a woman sees gold, she turns her head hither and thither like a trembling balance. When a pomegranate ripens, it becomes beautiful, and a pearl improves with age, but woman is without substance, and like a child or a grape, pleasant while young, but black when mature. Women are said to be in a house like cucumbers, *pucka* when *kacha*, *lacha* when *pucka*. He ends his diatribe with a compliment to the girl, saying that without her he is not at rest for an instant. She is not mollified and they remain apart, and the old brokeress adds to the estrangement. The king, however, is patient and does not force her inclinations. He treats her with courtesy and reserve, and his behaviour to her reminds us of the moderation shown by the Caliph Al Mansur to a recalcitrant slave, as described by Sa'di in the *Bostan*. At last the king wins by waiting, and the girl surrenders. One feels inclined to say with Walter in the *Princess* "I wish she had not yielded." But then what other course was left open to a slave?

There is a good deal more in the *Haft Paikar* than the stories told by the ladies. Bahram Gor's life and adventures are described, and also his disappearance in an abyss while hunting a wild ass. Nizami, however, says nothing about Bahram's incognito visit to the King of Kanouj, an incident which is related at length in the *Shahnama*.

According to Ferdausi, Bahram chose to go in disguise to the court of Shengil, the King of

Kanouj, and to give him a letter upbraiding him for his evil conduct. He stayed at Shengil's court for sometime and distinguished himself by killing a wild elephant, etc. Eventually Shengil discovered who he was and gave him his daughter Sapiñiral in marriage. Afterwards Bahram returns to Persia with his Indian bride. No such king as Shengil is mentioned in Indian histories or inscriptions and it is unknown wherefrom Ferdausi got the name. It is not given in the *Chronicle of Telasi* from which Ferdausi might have got the story of the marriage. The poet also mentions an earlier Shengil who was also king of India and assisted Afrasyab in his wars with the Persians. He was defeated and nearly killed by Rustam. The story of Bahram's secret visit to India is interesting as it seems to be the origin of the tale told by Catron and others, of an incognito visit to India by the Emperor Babar. Neither Babar nor any contemporary historian mentions such a visit, and is probably nothing but a legend founded on the *Shahnama*.

Shankal is mentioned in the Introduction to Ferishta's history in Elliot's *History of India* VI. 553. It is there stated that he came from Koch, that is, I presume, from Cooch-Bihar, or Assam, so he may be the Jangal Batahu mentioned by Mr. Gait, (A. S. B. J. for 1893, p. 275), or be one of his ancestors. Ferishta also says that Shankal was the founder of Lakhnauti or Gaur. There is also a reference to Shankal and Bahram in a work written early in the 13th century. (Elliot II. 159). Shankal is mentioned in the modern work, the *Risala-s-Salatin*, but probably this account is only copied from Ferishta.*

* My friend Mr. Jivanji Jamshedji Modi read in 1895 a paper before the Bombay Branch of the R. A. S. in which he dealt with Ferdausi's story of the marriage of Bahram Gor with the daughter of the Indian king Shengil. He suggests that the name Shengil may be connected with Sangala, the city stormed by Alexander. But against that we have Ferishta's statement that Shengil came from Koch, or Assam.

SIDE LIGHTS ON TECHNICAL EDUCATION

BY

MR. SHEWARAM N. PHERWANI, M.A., M.E.

A number of mistakes seems to have been made with regard to Technical schools and Technical school methods and that has to a great extent affected their popularity and usefulness. Technical schools have not found favour with the masses nor have they attracted any good number of sons of working men. Even the Educational department does not seem to be entirely satisfied with them. It is quite obvious they have not fulfilled the needs of the day.

That Technical education is sorely needed few can deny. That it has to play a grand part in the industrial regeneration of the land every one can see. In short the need is apparent but there is no satisfactory solution offered of the means of meeting it.

If technical schools are to be established with any hope of success, it should be borne in mind that they must have reference to the local industrial needs. The existing and prospective local industries furnish the starting point of the enquiry. A technical school should aim at supplementing the efforts of the local working man—the man engaged in the crafts. It is his shortcomings that are to be overcome. It is his welfare that is to be the object of our anxious care. It is his sympathy on which the success or failure of the work will depend.

The school is to lay the true foundation for progressive improvement in the existing and prospective crafts, to interest itself in the workmen, the material at hand and to inspire sufficient confidence by its sympathetic attitude so that the workman comes to feel that his son would be the better for being educated in the school and the layman feel that the school would furnish his son with the requisite for entrance to successful and profitable pursuit of the craft taught.

The location and distribution of school will follow as a corollary from this fundamental principle of taking the existing crafts and industries as the starting point. The industrial centre of a particular group of industries is obviously the best place where to disseminate knowledge concerning that group.

Again technical education means the imparting of theory as well as practical working skill in a particular branch of industry. Now it has been found that the schools have not at all been able to impart the practical skill which distinguishes technique from mere Science. The school, it has been generally found, cannot afford the constant practices and variety of application gained by the workman in his daily occupation or in the workshops. On this account the apprentices system of training workmen in the various crafts is still producing more and better craftsmen than the school. What the school should aim at should be to leave intact this method of acquiring practical skill and supplement it by imparting scientific and advanced knowledge of the craft or industry to the actual workers in the craft or workshop, etc.

Evening class work among the workmen, teaching them the three R's and drawing and then scientific instruction in their own art, is about the best way of making a technical school useful. Stricter and more regulated apprenticeship might be made the standard of admission to the evening class, but in any way the advantage of the vast practical training agency should not be neglected nor lost sight of. A technical school that loses sight of this would do very little good.

The Railway and other workshops are doing more substantial good in the way of technical training than the so-called technical schools. But by themselves these Railway workshops, etc., cannot bring out the finished progressive workman that we need. A Technical school working in conjunction with such big workshops would afford the ideal combination to produce the right

Buddhism in Burma.

BY "A BURMAN BUDDHIST."

There came a message from the East to me,
From Peoples of the Yellow Robe it came,
From Brothers of the Buddhist Doctrine, those
Who, since I love them, hold my race and name
Not Alien, nor disd'in, in cloistered close.

—Edwin Arnold

44 **Y**OU must yourself make the effort, the priests of Buddha only show the way."

This is the teaching of the ancient Indian religion which is the national and dominant faith in the "Land of Pagodas"—a land where one sees in every part of the country monasteries in which for seven centuries Buddhist monks have always been found, devoting their entire lives to meditation's way, and following the Path which is more precious to the disciple than all earthly power. Amid these pagodas and monasteries can be seen, devout, happy and cheerful Burman Buddhists, men and women falling upon their knees in the attitude of worship and uttering adorations to the Great Indian Sage who lived and enlightened the world two thousand and five hundred years ago. From their lips, one hears, "Namo tama Bhagavate Arabato, Sammasam buddhassa" and from others such heartfelt aspirations as "Nirvana—Nirvana! may I realise Nirvana." One cannot but be struck with the earnestness, sincerity, the beautiful devotion of these devout souls to the Great Teacher who has brought peace into their lives and who has made their existence one long psalm of thanks-giving. What one sees amidst these pagodas and monasteries is no ritual, no empty form but the overflowing of the hearts of love, who cry out from their very depths,—“we loved him because he first loved us.”

In those parts of Burma where the much-vaunted Western civilisation has not as yet spread its influence, as far as eye can reach, undulating hills are covered with rich tropical foliage, the summit of every hill is shrine-clad. White pagodas, crowned with golden *tees* (spires) glisten in the rays of the evening sun light. The music from the tinkling bells on all these pagoda-spires is wafted on the breeze. In every valley and nestling in each hollow is a *vikara* from which one can hear the never ending chanting of Buddhist *putakas* in the sacred language of the Buddhists—Pali, by the members of the Sangha—"that noble order of the Yellow Robe, which to this day standeth to help the world." In some parts of the country will be seen quiet and retired settlements of Burman Buddhist nuns—not old and decrepit women, but many of them young and beautiful and of good family, leading the lives of purity and usefulness and whole-hearted devotion to Lord Buddha. All over Burma will also be seen Buddhist *Zayats* (rest-houses), built for the free use of all, Buddhist or non Buddhist. In the monasteries, nunneries and *zayats* can be seen laymen and women who sojourn there to lead lives of holiness and purity. It is the life of these souls that is so much to be admired. There we see Buddhism as a life rather than as a consistent philosophy to be found in books. The lives of these people attract every stranger—lives of holiness, joyousness and devotion to the pure teachings of the Great Indian Sage, beautiful lives, the like of which one can fondly hope to see elsewhere. These are men and women who are living the life of the Master, taught and inculcated and lived—a happy land, brilliant with unclouded sunshine and musical with perpetual song, where constantly sounds the voice of praise and adoration to that King Siddhodana's Son who lived so many centuries ago in India and who has still power to sway to nobler ways the lives of five hundred millions of men.

I have described above what the pagodas in Burma are like; now let us visit a town where pagodas are most numerous. I mean Pagan, a town on the Irrawaddy river, once the capital of Burma, now an ancient and deserted city, with its hundreds of magnificent pagodas and temples slowly crumbling to ruins, helped on by the half hearted exertions of the Burma Archaeological Survey. Pagan is an amazing sight! Domes, spires, turrets, pinnacles, as far as eye could see, gleamed white and gold in the sun—a wilderness of sacred buildings of every shape, size and design and of every degree of antiquity, stretched from the bank of the Irrawaddy to the horizon; and fairest among them all, shone out the glorious Ananda Temple, one of the most magnificent which had sprung up under the magic touch of bygone Indian builders. By comparing the widely differing styles of architecture one can form some idea of the types of mind that evolved these structures so different in conception, yet each so beautiful in its own way and each harmonizing so surely with its particular environment. Not the least of the charms of Pagan is its utter desolation; no human footsteps stir the dust of its crumbling temples, no ears record the music of the bells, no hands bring flower and candles to the shrines. And yet the decay of this sacred city does not mark the decline of the faith that built it. All over Burma on every knoll and hill are springing up new pagodas, an indication that the teachings of the Buddha are living and growing still. Nearly every hill in Burma has its pagoda, their spires pointing upwards to the sky, with the object of directing the thoughts away from little, worldly cares to higher and nobler influences. Each elevated pagoda, open to sun and moon and cleansing breeze, is a place of calm and quiet thoughts; a retreat where passions and distractions fall away, where trivial details are forgotten and only essentials realised where one may, occasionally, get a glimpse of things in their true perspective, and

for a brief, blessed moment, fall in touch with the Infinite.

One of the means of studying Buddhism as professed in modern Burma is, I think, to go on the platform of the Shive Dagon Pagoda, the premier shrine of Buddhist Burma and to notice the visible emblems and the various rites and customs which are practised at the place. Here, around the Great Pagoda in which is supposed to be enshrined the relics of the Great Teacher of India, are numerous shrines each containing the figure of the Buddha. There are flowers in profusion—sweet-scented flowers, heaped before the shrines. Here also are rows of candles flickering in the breeze while occasionally the pungent smell of the burning incense floats along the air and overpowers the perfume of tropical blossoms and the smell of gutting wax. Handwoven silks and hand worked lace of symbolic design are hung about the shrines, and delicate carvings, rich gilding and warm colours skilfully blended to beautify the sacred place. Round about the pagoda devotees kneel with reverent demeanour and folded hands, and the vows they repeat are intoned and pronounced in unison. Perhaps in some remote, unfrequented corner, an old Burman lady, her youth past, her sweet resigned expression, indicative of trials bravely borne, may be seen in silent earnest devotion, uttering and repeating, "Buddhasaranain gacchami, Dharmasaranain gacchami, Singhasaranain gacchami!" weary and heartsick she seeks refuge in this peaceful atmosphere of the pagoda platform.

Judging from its results, this great religion which was founded twenty five centuries ago in Jambudvīpa (India), it may be said, has a very great hold on the people of Burma. It enters into their daily lives, even influencing their choice of food and of occupation. Every good Burman Buddhist repeats daily the *Pāṇca sīla* (five precepts) and strives to keep them. The children of a Burman Buddhist household are gathered

PRAJNAPARAMITA

This figure of personified "Transcendent wisdom" is the *aniti* of the Tantric Buddha Adibuddha, who in Mahayana Buddhism occupies the place of Brahma.

H. H. SHRI SAYAJI RAO GAEKWAR.

INTRODUCTORY

ONE of the most daring experiments tried by British diplomacy in India was to bring an utterly illiterate lad from a farm in an obscure village of the Bombay Presidency, and, on May 27th, 1875, proclaim him the Maharaja of Baroda, a Native State over 8,000 square miles in area, and peopled by 2,000,000 souls. This was done just thirty-seven years ago, and to-day the English have reason to compliment themselves upon the results, for the erstwhile farmer boy is now, by common consent, regarded both at home and abroad as being in the vanguard of the most enlightened and progressive Indian Rulers.

During the thirty-one years that have elapsed since December 29th, 1881, when the minority regime came to an end and His Highness Shri Sayaji Rao III., Gaekwar, *Sena-Khas-Khel-Shamsher-Bahadur, Feroz-i-Khas-i-Dowlat-i-Inglisla*, Maharaja of Baroda, was invested with powers, his Principality has been so wisely ruled that to-day, in point of administration, it vies with the British Government of Hindostan. Its subjects are steadily growing in prosperity; the taxes realised are conscientiously and carefully used for advancing the material and moral welfare of the people and preparing them for democratic rule; and education, sanitation, and public works are being pushed on with a vigour and intelligence that would do credit to any potentate.

Inspiring as the administration of the Maharaja of Baroda has been for educated Indians, who are ceaselessly reminded that they lack capacity to govern themselves, his example and advice as a social and religious reformer have also been of incalculable benefit. In his own case, he has sought to overcome the inertia of ages and assert his independence in crippling the canons of caste and creed. Not

content with setting his own house in order, he has endeavoured to quicken the sluggish Hindu conscience and persuade his countrymen of all shades of opinion and in all parts of Hindostan to renounce reaction and racial rivalries and follow the most progressive nations of the world. Few Indians have done more to uplift the unfortunate pariahs, whom custom condemns to grovel everlastingly at the foot of the social ladder; to stem the tide of early marriage and enforced widowhood; to emancipate womanhood; and free the people from the yoke of priestcraft.

Thus, viewed both as a Maharaja and as a man, Sayaji Rao can boast of a useful past record and a promising future programme.

FROM FARMER BOY TO MAHARAJA

It was by a singular stroke of good fortune that the present occupant of the throne of Baroda became the Ruler of one of the largest Native States. The crown His Highness wears was wrested from the man who was born to it, and set on the brow of Sayaji, who was bred in a farmer's cottage at Kavla, in the Nasik district of the Bombay Presidency. The story of this dramatic occurrence is simply told.

On November 28th, 1870, upon the death of Khande Rao Gaekwar, his younger brother, Malhar Rao, in default of male issue of the deceased Maharaja, ascended the *gadi* of Baroda. The newly made Ruler began his reign by mercilessly persecuting his predecessor's favourites. As time went on, he became more and more tyrannical. So many complaints of his oppression and profligacy poured in a never-ending stream into the Council Chamber of the Suzerain Power that on April 10th, 1875, he was summarily deposed and sent into exile.

Upon the deposition of Malhar Rao, every one believed that the crown would pass to one of the four scions of the reigning family who lived in the City of Baroda. But the Paramount-Power considered that every one of them was too old to learn how to wisely manage the affairs of a huge and wealthy Principality, and too much steeped in the vices that ran riot in Malhar Rao's capital to make an honourable ruler. Possibly in virtue of these con-

siderations, or for reasons of fact—a point too delicate and abstruse to discuss in the course of a short sketch—the claims of these men were found to be more remote than those of the members of the Gaekwar family who resided in the obscurity of the small village of Kaviana, and possessed the advantage of having three boys—Gopal, Dada, and Sampat, twelve, ten and nine years old respectively—each young enough to be moulded into the kind of man the British Government wanted for the position of power. In shuffling the cards of diplomacy, the Paramount power saw to it that one of these three lads should be chosen to occupy the throne of Baroda which Malhar Rao had been compelled to vacate.

Consequently, the boys were despatched to the Capital of the State so that the Dowager Maharani, her Highness Jamnabai, might have the privilege of deciding which one of the three boys should succeed her deceased husband, Khande Rao, as his adopted son, as if Malhar Rao, his disgraced and deposed younger brother, had never been set on the *gadi*.

Persistent rumour has it that at the very first audience the little fellows had with the Maharani, Gopal was able to sway the sentiment of the Queen in his own favour. Her Highness asked them why they had come to Baroda. The youngest was so awed and bewildered that the only reply he was able to make was to smile silyly and burst into a tumult of tears and sobs. The next oldest, more stolid, did not comport himself so hysterically. He replied to the query as any well-mannered Hindu boy of his age might have been expected to do, and declared that he had come to Baroda because his relations had brought him there. Gopal, on being asked the same question, airily answered: "I have come to be the Maharaja of Baroda," which showed amazing *sang froid*, when it is considered that the illiterate, rustic lad had spent all his life dwelling in a bare mud cottage, clad in the poorest garb, with no prospect for the future other than plodding behind the oxen in the furrow of his father's field.

Gopal's bold claim, however, was not so wonderful as was the fact that he actually

captured the prize which he calmly asked for. The Maharani and her advisers decided that he gave the most promise of any boy belonging to the Gaekwar family. Whatever the truth of this story may be, there is no doubt that Gopal was considered to be the most intelligent of the three boys to whom the choice had been restricted. On May 27th, 1875, therefore, with the approval of the British-Indian Government and the State, the little farmer lad was set on the throne, assuming the title of "Sayaji Rao III", by which name the sometime Gopal Rao has ever since been known.

EARLY LIFE AND EDUCATION

Elevation to the throne of Baroda naturally meant transition from penury to princely magnificence. The little fellow who never had known anything of the luxuries of life, but had spent his young years in a farmer's hut, was now given a suite of four rooms for his exclusive use in the *Sarkarwada*, at that time the royal residence of the reigning family. The floor was covered with a soft cotton pad which, in turn, was covered with a snow-white sheet, over which no one was permitted to walk without removing the shoes, even the young, newly-made Prince shuffling off his gold-embroidered, gem-studded slippers before entering. He slept on a silver and gold plated bed with a padded mattress fourteen inches thick, covering himself with an embroidered silk and gold bed-spread or a fine Cashmere shawl. All night long a servant stood beside him waving a yak's tail to drive away the mosquitoes, while another man massaged his feet and legs when he felt wakeful, and told him stories until he fell asleep. His meals were served in gold dishes, and his stool in the family dining room was of gold. He was given a large wardrobe of regal clothing fashioned out of rich velvets, brocaded silks, and cloth of gold, all gorgeously embroidered, requiring a large staff of servants just to keep it in order. On his installation he came into possession of a collection of precious stones and ornaments valued at six crores of rupees, and when he was dressed in his State robes, his little body scintillated like the sun. He had mounts of all kinds, from richly caparisoned elephants

had enjoyed but five years of schooling, and that of an indifferent nature. Moreover, the lecturers set themselves upon pedestals and talked down to their royal pupil, and their attitude of superiority created in him a feeling of antagonism and obstinacy. Where there was such a state of mind, it was impossible to derive much benefit from the lectures, and for this reason, if for no other, the talks proved more or less barren of permanent value. Much better results would have been obtained if the original plan had been carried out, and Sayaji Rao had been taken to visit the villages and towns in the neighbourhood of his Capital in order to familiarise himself, at first hand, with rural organisations, and with the arrangements and work of the subdivisional courts and the forest department, at the same time inspecting schools and dispensaries. This was not done, and the young Prince was left to acquire practical knowledge of the workings of the Administration after he attained his majority.

THE MINORITY REGIME.

While Sayaji Rao was being educated, Raja Sir T. Madhava Row, the distinguished statesman, assisted by a corps of capable Indian officials, was putting the affairs of the State on a sound basis. On account of the maladministration of the previous ruler, this was no easy thing to do, but Raja Sir T. Madhava Row, with the advice and co-operation of the British Resident at the court of Baroda, succeeded uncommonly well in achieving the seemingly impossible task and by the time Sayaji Rao was given full ruling powers, had managed to set the State machinery running smoothly, having reorganised every department and introduced modern ideas of statecraft.

While, owing to exigencies of space, it is impossible to go into details, it must be said that just what transpired during the minority regime is very little understood by the Indian public. Those who are ardent partisans of the late Raja Sir T. Madhava Row would have us believe that the entire credit for what Baroda is to-day must be given to the dead administrator. Those who are devotedly attached to the present Maharaja, on the contrary, meanmindedly minimise what the great man really did. These evidently are extreme views, ins-

pired by prejudices, and the truth lies midway between them. The writer has given his most careful attention to this phase of the subject, and is of the opinion that while Sayaji Rao has built very wisely and well, he owes a great deal to Raja Sir T. Madhava Row, who undoubtedly laid the sound foundations on which the Gaekwar has erected his magnificent administrative structure.

THE STRUGGLE TO BE A REAL RULER

The first important action of Sayaji Rao after being invested with ruling powers on December 28th, 1881, was to get rid of the man who had ceaselessly and capably worked to improve the condition of Baroda subjects. Raja Sir T. Madhava Row was given a handsome present of money, and made to understand that his resignation would be accepted. He appears at first to have wanted to make some trouble over being thus cavalierly gotten rid of—there is ample documentary evidence of this; but on calm reflection, statesman that he was, he took the hint broadly given him, calmly pocketed the gift, and shook the dust of Baroda from off his feet. The British-Indian Administration acquiesced in this arrangement, being anxious not to fetter the hands of the new Maharaja. There can be no doubt whatever that a clique of officials, who had banded themselves together against the man who for six years had been the uncrowned ruler of the Principality, was responsible for his retirement. The fact of the matter is, however, that if Raja Sir T. Madhava Row had not gone just when he did, within a short time he would have been forced to leave. Early in his manhood Sayaji Rao III developed into a lion, and he would not harbour another member of the same species in the same den with himself.

However, if the Maharaja had an idea that by eliminating Raja Sir T. Madhava Row he would automatically become the actual ruler, he was quickly disillusioned. He was too young and inexperienced, altogether too much lacking in the knowledge of statecraft and diplomacy, to be capable of holding the reins of government virtually instead of nominally in his own hands.

This being the case, it is a wonder that the elimination of Raja Sir T. Madhava Row

did not cause degeneration in the State regime. But the young Maharaja, though a mere youth, was wise enough to retain all the colleagues of the ex-Premier, whose vacant position was filled by the man who had held the position of Revenue Minister under the Madras statesman.

Being uncommonly shrewd, and having determined to be independent of control in the management of the affairs of his State, Sayaji Rao set out in a most conscientious and painstaking manner to learn the business of government in its minutest details. Taking no thought of food, clothing, or princely luxury, denying himself even the pleasures of the ordinary benedict (he wedded Laxmbai, a niece by marriage of the Princess of Tanjore, C.I., a few months previous to his investiture with full powers, and, within a year of her death in 1885, he married Gajjarabai, member of the reigning family of Deas, who under the name of Chinnabai II, C.I., is the present Maharani) he bent his whole energies to the work of mastering the details of the levying and collection of land revenue and other cesses, the preservation of peace and protection of life and property, the administration of justice, the codification of laws, and measures for public good such as education, sanitation, and public works of all beneficent kinds. All his waking hours were spent poring over official documents and questioning officials. Having garnered all the knowledge of public affairs he could from the study of conditions in his own Capital, he travelled far and wide, to the remotest corners of his dominions, studying there the needs of his people. When he considered that he had learned all he could from one Prime Minister and set of officials, he would dismiss his Dewan and import another from some other part of India, choosing him from an altogether different section of society, nationality, race, and creed, and would shake up official circles generally so as to bring new brains into the administration that would enable him to gain fresh information in regard to statecraft. When office hours were over, he spent his time studying ancient and modern systems of jurisprudence, political and social economy, philosophy, religion, and art. When he had come to the

end of his resources for gaining knowledge in Baroda, he toured all over India, and later even crossed the ocean—a bold step in those days, and taken in defiance of caste canons—travelling in Europe and America, inspired by the single desire to learn how to rule wisely and well, so as to promote the peace, prosperity, progress, and general well-being of his people. Such industry and perseverance enabled Sayaji Rao to become the real (instead of the mere titular) Ruler of Baroda, within a few years of his investiture on December 28, 1881.

THE MAHARAJA'S ACCOMPLISHMENT.

The result of this centralisation of power into the hands of the Maharaja has proved of incalculable benefit to his subjects, for Sayaji Rao III, has made the interests of his people the sole study of his life, and has devoted his time and talents to their mental, moral, and material improvement. He has abolished numerous unjust cesses and taxes, carried through surveys of land revenue calculated to benefit both the subjects and the state and forced the feudal barons to relinquish their merciless grip on the public purse. He has built a system of canals and reservoirs, materially increased the number and capacity of irrigating wells in order to insure his subjects—for the most part farmers—against the loss of their crops through drought, and enable them to bring the fallow land under cultivation, thus making the old farms yield larger crops. He has spent immense sums of money in opening up new roads and keeping the old highways in good repair, increasing the facilities of communication throughout his territories, and erecting public buildings. With a view to shielding his people from the irascibility of officials, he has separated the judicial from the executive functions, a reform which has not yet been effected in British India. His desire to do the right thing by those who look up to him as their protector and "father," has manifested itself in the founding of libraries; the installation of waterworks; the provision of a sanitary inspector who travels about the villages and enlightens and interests the rustics in the science of hygienic living; the establishment of experimental farms; the

importation and distribution of better seed; the employment of agricultural experts to go here and there amongst the farmers and teach them how to do their work in a modern manner; the advocacy of the use of up-to-date farm methods and implements; the building of perfectly equipped hospitals, the maintenance of an insane asylum with padded cells and other appliances that are not surpassed by similar paraphernalia anywhere else in the world; the establishment of a State-aided bank, and the promotion of industries by the grant of liberal subsidies, and by sending promising Baroda men to secure training in the factories, shops, and technical institutions of Europe, America, and Japan. He has also enacted a great deal of social legislation, such as passing a Juvenile Court Law, and raising the age of consent and marriage, which, when properly enforced, is bound to work for the uplift of his people.

DISPELLING MENTAL DARKNESS

Probably the most useful measure that the Maharaja of Baroda has promulgated is that which makes primary education of males and females free and compulsory, throughout his domains. In this respect he has forged ahead of the Government of India, and the administrations of most of the Native States, which hesitate to take such a radical step. In providing for the education of his people, however, Sayaji Rao has been careful not to let his ardour betray him into making the workings of the compulsory education act so inexorable that it will cause hardship to the poor people, or tend to antagonise them. Indeed, the provision has been so humanely and elastically applied that while it steadily reduces the number of children of school-going age who do not attend institutions of learning, at the same time it does not rouse the opposition of illiterate parents, who have been accustomed to look upon their boys and girls as economic assets, and who would be inclined to resent any brusque efforts to tear away from them this source of income. The educational and executive officials of Baroda have intelligently and sympathetically co-operated with each other to devise and put into active operation methods calculated to sweep aside obstructing

prejudices and traditions, and pave the way for the successful working out of the scheme of education that has been built up by the Maharaja.

Special facilities have been provided for the education of the "untouchables" of the State, and schools and hostels especially designed for them abound throughout Sayaji's Principality. Through his bounty, an "untouchable" young man is at present being educated to be a doctor of medicine, and shortly will be able to sign the letters L. R. C. P., the first of his unfortunate community of low castes to have the advantage of such professional education.

All along the Gaekwar has been a patron of the highest learning, and in his zeal to spread elementary education, he has not failed to provide proper and adequate facilities for higher cultural and scientific training. He has established secondary schools in his State, and a college at the Capital, all well staffed and fully equipped. At present he is perfecting a scheme to found a Science Institute.

Recently the Maharaja of Baroda has turned his attention to the task of removing the great stumbling block that has stood in the path of progress of his countrymen on account of their being forced to obtain their education through the medium of a foreign tongue—English. It is apparent on the very face of it that this procedure involves a tremendous waste of time and energy. Sayaji Rao, who is in the forefront of the advocates of imparting education through the vernacular, is now engaged in making arrangements for employing the predominant dialect of his State—Gujarati—in the schools.

PREPARING HIS PEOPLE FOR AUTONOMY.

Having succeeded in centralising the administrative powers of his State in his own person, of late years the Maharaja has been attempting to part with some of his authority. This has been undertaken without any undue pressure either from above or below, but has been spontaneously engaged in by this progressive Ruler. He has made several regulations which make it possible for proposals and changes which formerly needed to have his formal sanction before they could be effected,

to be disposed of without his approval or consideration, the Dewan, heads of departments, and even, in some cases, lower officials, being empowered to follow their own initiative in dealing with these matters. A Decentralisation Committee has been engaged, for some time past, in making exhaustive inquiries into proposals for breaking up the powers of the Ruler and his superior officers. In addition to this, the Executive Council is being steadily given greater authority. Municipalities exist in some of the leading cities of Baroda, which have on their rolls non-official as well as official members, and the latter are given greater privileges, and are ceaselessly clamouring for more.

While it is unfair to say that the Maharaja has gone far enough in this respect, or that his actual accomplishment has been altogether satisfactory, still it must be said that without doubt he is sincerely desirous of decentralising his powers. It is only recently that he has commenced to make any great effort in this direction, and naturally he must have felt timid at taking the steps he proposed. This probably explains the slowness with which the decentralisation is taking material form. But, at any rate, he has shown extreme anxiety to prepare his subjects for autonomous government.

One of the means of achieving this end which the Maharaja is employing is to attempt to develop the Indian talent for self-government by reviving the *Panchayats*—the village communities. This has been the instrument of autonomy in India since time immemorial, but under the *ergis* of the British administration of Hindostan, it has been crushed rather than encouraged and extended. The most unimaginative person must grasp the fact that any endeavour to resuscitate this institution and broaden its scope is a praiseworthy effort, and a step in the right direction.

HIS HIGHNESS' ENEMIES.

Such an accomplishment by a Native Ruler naturally is an eyesore to those who prattle about Indian inefficiency. These people have always tried to find flaws in Sayaji Rao's reforms, and cavil at them. However, not being able to controvert the fact that Baroda has steadily forged ahead under the guidance of its present

Maharaja and compares favourably, in every respect, with the most advanced portion of British India, these carping critics have sought to decry his Highness as a *foe to Pax Britannica*.

Probably the declaration that the Gaekwar is a rebel is inspired by the desire to frighten him from taking a lively interest in movements calculated to uplift his countrymen who dwell outside his domains. It is a well-known fact that a great many people do not wish to see His Highness working alongside the commoners who are interested in rousing Indians to shake off their fallen condition and strive to shake off the lethargy of ages. These men believe that it is dangerous for the British to permit a native of the soil to become a popular hero. It is equally a well-known fact that, on account of the peculiar conditions existing to-day in Hindostan, to brand an Indian as a treacherous rebel is to pronounce his ruin.

However, the Gaekwar is too old a bird to be alarmed at a scarecrow. He flatly contradicted all rumours which thrust upon him the notoriety of being the treasurer-general, if not the father, of Indian anarchism, which followed in the wake of the Delhi Durbar, of 1911 in the course of which his Highness is said to have treated His Imperial Majesty King-Emperor George V., with discourtesy. His Highness doubtless will see to it that nothing about his future life could possibly be construed or misconstrued as contradicting his professions of loyalty to *Pax Britannica*.

THE GAEKWAR AS A PATRIOT.

For the sake of India, let it be hoped that the Maharaja of Baroda will continue, both by means of precept and example, to inspire his countrymen to work for their evolution. His past contribution to national well-being in this respect has been important. Both in his life and works there is a great deal to help the movements of reform and progress.

From the very beginning up to the present time, the Gaekwar has sought to break down the tyranny of the priest-craft. He personally has refused to abide by the ordinances which debar certain castes from reading the *Vedas*, or hearing them read. He has equally turned his back upon the canons which prohibit

the characteristics of the peoples of India is politeness. There are two articles which pass under this name, the spurious and the genuine. The first is largely a trick of manner, the observance of certain forms of etiquette current in what is called "polite society." This may not be widely characteristic of India. But of far higher value is what may be spoken of as "natural politeness" and this is peculiarly characteristic of Indians, and is found among all classes of society. Such politeness is not merely a question of "manners" learned by the force of example, from generation to generation; it is indicative of a real quality of character. It is the manifestation of a spirit of consideration for others, of unselfishness, of a spirit the exact opposite of the spirit of "grab," which prevails so largely among some peoples. In any such broad generalization as is here attempted it necessarily follows that universality cannot be claimed for this quality. Selfishness is not an unknown quality, and impoliteness is not extinct, but allowing for all this, it may be broadly stated that politeness is very prevalent, and that this is a quality and not merely a manner, and should be fairly regarded as an asset of very great value in the Indian character. It makes for happiness and well-being in the corporate life, and quite corresponds with the fact that though in India there are many things opposed to the development of public-spiritedness, yet in the somewhat narrower spheres of life individualism is subordinate, and loyalty to corporate life is strong. As the restrictions and narrowing forces, which have in the past stood in the way of the broadening out of this spirit, are broken down, and full sway is permitted to this same spirit, expectations of great good may reasonably be entertained.

It is commonly said that the peoples of India are, as a whole, patient and contented. This is true, though, of course, not universally true. Recent years have certainly disclosed much dis-

content and not an inconsiderable measure of impatience, and without committing oneself to an approval of either the spirit which has been manifested or the forms of expression which the manifestations have taken, it may be frankly recognized that contentment with things just as they are, because they are so, is not conducive to progress, and a patience which makes no endeavour to overcome obstacles and reach a higher level is but a doubtful virtue. True patience means the steady maintenance of lofty ambitions, undimmed by difficulties and obstacles, strong faith in eventual attainment, and the willingness to toil, and if need be, to suffer, in the endeavour to attain. Impatience is a sign of weakness, not of strength, it is chafing under difficulties instead of meeting them squarely and working until they are overcome, it is the manifestation of fear instead of calm confidence. On the other hand, true contentment does not involve the patient acceptance for all time of things as they are, but the cheerful endurance of them for the time being, resting in the strong hope of a better time coming and honestly endeavouring to better them.

One would not wish to discount the value of the patience and contentment which have been so widely found in the past, and are largely prevalent among the great masses of the peoples at present, but, in seeking to estimate their true worth as regards the future of India, they must be fairly weighed. If it not possible that some of that which passes for patience is an indication of apathy, the want of a rich vitality, the failure to recognize man's high destiny? Much of the discontent and impatience more recently manifested is the outcome of the discovery of this fact without the clear vision of the final goal, the calm trust in God which is assured of the working out of the world's order in due time, if men can only learn to trust, and wait, and work.

Another characteristic claims consideration which is intimately related to the life of India,

Perhaps we should rather say a group of characteristics, and it should be noted that these are closely associated with the tendency of much of the religious teaching. We refer to the feeble sense of the reality of the world and worldly affairs, and kindred with this, in origin and outworking, the limited conception of the reality and importance of personality and personal responsibility. Whether these practical, or rather unpractical, conceptions be the result of a philosophy which so widely dominates the thought of the educated, and simmers down to the great masses of the people, or whether the philosophy be the reflection of some inherent trait of the peoples of India, who can say? Certain is it, however, that this whole trend of thought and character has been a potent factor in the development of the life of India. There is another phase of character which might be treated separately but which it is better to regard as bound up with this. We refer to the want of enterprise, which, though by no means universal, is yet a strongly marked feature in the life of India as a whole.

It would take us too far afield to attempt to deal with this whole subject from the philosophical standpoint, but it would be vain to pretend to consider the life of India without taking into account this attitude of mind and the marked influence which it exercises on the general trend of the activities of the whole continent.

This tendency to belittle the worth of the material world in which our lot is cast, and to make the unseen the all-in-all must inevitably work disaster not only as regards the present life, but affect man's whole spiritual outlook. It is idle to talk of a goal without a road, or to regard the goal as real while the road is unreal. What consummation can there be to a process which is void of worth and reality? Why regard the eternal past and the eternal future as abiding realities and relegate to the

domain of unreality the present and that universe from which alone we can obtain some dim vision of the past and the future? It may be rightly urged that the material is but the visible expression of that which is spiritual and eternal, and the so called present is but a speck belonging to the past ere we can lay hold of it, but the thought of God and His purpose can only be ours through the expression of Himself which He has given us, and that largely through the instrumentality of material things. The present is a part of eternity, and our earthly life is not a bubble and a vapour, but a divinely ordered reality of tremendous moment.

"Tell me not, in mournful numbers,

"Life is but an empty dream!"

Life is real! Life is earnest!"

A great change is coming over the mental outlook, and the practical position of men with reference to this matter, and this is pregnant with possibilities for the future of India. It is urgently imperative that a great transformation should be effected in this whole realm of thought and life.

On the one hand a denial of the personality of God involves weakened sense of human personality and personal responsibility, and unless the reality and significance of man's personality be accepted there is little ground for insisting on the personality of God. With a God possessing no personality, animated by no purpose, and exercising no activity the life of man and the whole cosmic process lose the high place in human estimation which they ought to hold, and human activity ceases to be regarded as a part of the divine order. Man's attitude towards the world and his activity are of well-nigh infinite importance not merely for the sake of achievement in outward result, but for the development of life and character. Pragmatism may be a very insufficient philosophy, but a philosophy which finds no place for the aspect of life which is emphasised

in Pragmatism must prove emaculated and unproductive of result

Science and History on the one hand, and Metaphysics on the other ought not to be arrayed in antagonism one against the other, but recognized as allies. The reality and worth of human experience must be accepted as constituting part of the process which has the great consummation of man's destiny as its goal, and as we pursue the process we shall be nearing the goal.

The world is naught, the final beatitude is all—such has been largely the teaching in the past. Just now there is the danger that the world may loom too large and man's final destiny lose its supreme place. Our great task is to adjust the two that each may minister to the other. They are not two separate things but parts of one vast whole. God is not the All, but He is in all and works through all, and they alone will find refuge in the bosom of God who have bravely toiled in the broad fields of His universe and met life's responsibilities in the calm assurance that they were doing the Father's will when performing faithfully the common duties of daily life.

Are we any nearer a conception of the life of India? The life has been so variegated in its outward forms that to find a normal type or comprehensive unity may be impossible. Inner unity has also been sorely lacking, for multitudinous elements have been present side by side and instead of a persistent endeavour to bridge these differences over, they have been carefully safeguarded and exalted to the dignity of a divine ordinance. Various ideals have been presented for acceptance, and great masses of the people have been left to drudge along with no ideal at all. And yet amid the confusion and the apathy there have been tendencies and endeavours which are not without suggestion of hope, and thereby has dawned in which larger conceptions of life are laying hold of the imagination of many in India, and there is distinct promise of a higher unity, and a fuller and richer life.

ISHWAR CHANDER VIDYASAGAR.*

AS AN EDUCATIONIST AND REFORMER

THREE names will stand out conspicuously among the greatest reformers of the nineteenth century, those of Rājī Rām Mohan Roy, Keshab Chunder Sen and Ishwar Chander Vidyasagar. All of them come from Bengal, but their names are household words throughout India. Of these Rām Mohan Roy and Keshab Chander Sen were the inspirers and founders of a separatist movement, but Vidyasagar wrought from within the Hindu Society. He was the earliest reformer who tried to effect reforms on shastric lines. But Ishwar Chander was not a mere reformer; he was a great scholar, author, educationist and Sanskritist. As Paul Reinsch says in his *Intellectual and Political Currents in the Far East*, "the name Vidyasagar—Ocean of learning, a *nom de guerre* or might we say, *nom de sauoir*, like the titles bestowed on great medieval teachers, was conferred on its holder by his *alma mater*. With a head resembling that of Esopus as pictured by the Greek sculptor, this Indian scholar, versed in all the classic lore of his country, was no less deeply interested in the broad currents of humanity than was the Greek fabulist, nor was he entirely without the other's sense of humour. He found time to become a leader in social reform movements and to do for the Bengali dialect what Luther had done for his Saxon tongue."

Ishwar Chander Vidyasagar was born on the 26th September 1820 at Birsingha. When he was five years old, he was sent to a primary *patasala* at Birsingha where he got the rudiments of Bengali language from a Kulin Brahmin, Kalkinta Chattopadhyaya. Even then

* Abridged from a sketch prepared for Messrs. G. A. Natesan & Co's "Biographies of Eminent Indians" Series.

he gave promise of his future powers. He finished his course in the school in three years. Like most great men he was apparently naughty and many anecdotes are told of his childish waywardness and mischievous freaks. Yet the boy was intelligent and the teacher was able to report to his father: "He had finished his curriculum here. You should take him to Calcutta, and place him in a good English school there so that he might receive proper English education."

When Ishwar Chunder was nine years old he was taken by his father Thakurdas to Calcutta for further education. Thakurdas wanted to send him to the Hindu College, but he could not do so for three months. This time the boy spent in a neighbouring vernacular *patasala* under the tuition of a veteran teacher. He was then sent to the Sanskrit College where education was given by Pandits in the old-fashioned style. There Sanskrit education was given to the total exclusion of English. The curricula included Grammar, rhetoric, Smrithi, philosophy, Vedanta, *belles lettres*, astronomy and Ayurveda. The teachers were exceedingly pleased at the uncommon ability displayed by Ishwar Chunder. The first three years after joining the College he studied Grammar, standing first in the examinations and carrying away the prizes. Then six months he devoted to the study of Amarakosha and then he took to *belles lettres*. He was then only eleven years old, and the teacher objected to give him admission to the *belles lettres* class on account of his age. He requested the teacher to examine, and having stood the teacher's scrutiny successfully he joined the class.

The first year he studied Raghuvamsa, Kumarasambhava, and Raghava Pandiniya. At the annual examination he headed the list of successful students and won the first prize. In the second year he read Megha Bharni, Sakuntalā, Meghaduta, Uttaracarita, Vikramorvasi, Kadambari, Dasa Kumaracarita, Mudrarakshasa

and other poetical and dramatic works. Most of these he had learnt by heart and could repeat with wonderful accuracy. He was best at translation. Even at the early age of twelve he could speak Sanskrit and Prakrit correctly. Not only his teachers and school fellows, but the pandits of the day were amazed at the wonderful powers of the boy. He was indeed a prodigy.

While yet thirteen, Ishwar Chander's fame spread far and wide and naturally there came many offers for marriage. He was married to Dinamayi Devi the next year. While fifteen he joined the rhetoric class. In one year Ishwar finished Sahityadaipana, Rasagangadhara and other works on rhetoric. He won a monthly scholarship of Rs 8. In 1837 he joined the Smriti class and within a short time passed the examination. The general practice at that time was that students should pass through the philosophy and Vedanta classes before they could be admitted into the Smrithi class. But Ishwar resolved to study Smrithi first, as he had a great desire to pass the Law Committee Examination and become a Judge-Pandit, for unless one passed that examination, one could not aspire to that post. He therefore applied to the authorities and obtained permission to study Smrithi before philosophy and Vedanta. The subject was so very difficult that even those who had gone through these courses took two to three years to study the Mithakshara, Dayabaga and Manusmriti and then to obtain a tolerable knowledge of Smrithi.

He however continued his lessons in Vedanta and while he was studying the philosophy, he was appointed for two months to officiate as second teacher of Grammar on a salary of Rs. 40.

As soon as he passed the final examination of the Sanskrit College, he won the title of Vidyasagar from the College. It was indeed a unique honor and it was at the early age of twenty. Even while reading in the College in 1838, Mr.

John Mayor, a Civilian offered a prize of Rs. 100 for the best essay in 100 slokas of a description of the earth and the celestial globe according to the ancient Hindu poems, Bṛiṣa Sāhitya and the modern European notions. Ishwar Chander's poem was considered the best and he won the prize.

After leaving the Sanskrit College Ishwar Chander took up a post under Mr Marshall in the Fort William College which had been established for the education of English Civilians in the vernaculars of the country. The head Pandit had frequently to come into contact with Englishmen and Ishwar therefore desired to study English. He began to study the English language under Dr Durgacharan Banerjee, the father of Bibu Surendranath Banerjee. He studied Mathematics and Shakespeare critically. He displayed equal ardour in studying as in teaching.

Vidyasagar did much to introduce various reforms in the Fort William College. After he entered the College he witnessed a great change in the educational policy of the country. When he first entered the Sanskrit College as a student in 1829 English education had spread only among some respectable residents of Calcutta and its neighbourhood who appreciated the value of English education and tried to introduce it. One day Lord Mordaunt, the then Governor General of India paid a visit to the College when he had a long talk with Vidyasagar on various educational topics. As a result of the conversation it was settled that a number of vernacular schools should be established. Between 1844 to 1846 as many as 301 such schools were established in different parts of the country styled "Mordaunt Schools" after the name of their founder.

In 1848 appeared Vidyasagar's "History of Bengal" in Bengali and in September 1849 Jibana Chintā. This was a piece of translation, compiled from Chamber's Bio-

graphy. It contained the lives of men like Galileo, Newton, Herschel, Grotius, Leonius, Newton and Jones. The next year after Vidyasagar's re-appointment in the Sanskrit College the posts of the Secretary and his Assistant were abolished and in their stead the post of Principal was newly created. Vidyasagar was made the first Principal in January 1851. Shortly after his appointment as Professor of *Belles-lettres* Vidyasagar was charged by the Education Council to report on the working of the Sanskrit College. He presented a very able and learned report in English which won the admiration of the Education Council.

Vidyasagar's chief aim was to improve the College and he applied himself heart and soul to remodel the school and bring it to proper working order. There was at that time obtaining an one-sided practice in the College restricting the admission of boys of other castes than the Brahmin, Kshatriya and Vaisya. He reported to the Education Council against it. The authorities approved of his scheme, and they granted permission to take Kayastha boys into the College. It was some time after this, that the other Śūdras were also permitted to read, in the Sanskrit College, all other branches of the Sanskrit Literature save Theology.

In 1855 the Government resolved upon starting aided English and Vernacular schools in different parts of the country and Ishwar Chander was called upon to report on the mode of instruction to be imparted in those schools and the scheme of their working. The report that he submitted commended approbation. He was appointed a Special Inspector of Schools, on a monthly salary of Rs. 200 in addition to his pay of Rs. 300 for holding the post of the Principal of the Sanskrit College. Vidyasagar soon submitted another report for the opening of a normal school to train teachers for the newly established schools. A normal school was established in the premises of the

Sanskrit College under Vidyasagar's management.

Great as was Vidyasagar's work in the cause of education, greater still was his work in social reform. He interested himself in female education and the remarriage of widows and worked for them with great earnestness and assiduity. As a Sanskrit scholar he naturally turned his thoughts toward the Shastras to draw inspiration from them and found that there were texts in favour of reform. The result was the publication of pamphlets in Bengali discussing the question and pointing out that the Shastras allow the re-marriage of widows. He had them translated into English. On the 14th October 1855 he got a memorial presented to the Government of India. The memorial said —

"1. That by long established custom the marriage of widows among Hindoos is prohibited.

"2. That in the opinion and firm belief of your petitioners this custom, cruel and unnatural in itself, is highly prejudicial to the interests of morality, and is otherwise fraught with the most mischievous consequences to society.

"3. That the evil of this custom, is greatly aggravated by the practice among Hindoos of marrying their sons and daughters at an early age, and in many cases in their very infancy, so that female children not unfrequently become widows before they can speak or walk.

"4. That in the opinion and firm belief of your petitioners, this custom is not in accordance with the Shastras, or with a true interpretation of Hindoo Law.

"5. That your petitioners and many other Hindoos, have no objection of conscience to the marriage of widows, and are prepared to disregard all objections to such marriages, founded on social habit or on any scruple resulting from an erroneous interpretation of religion.

"6. That your petitioners are advised that by the Hindoo Law, as at present administered and interpreted in the Courts of Her Majesty and the East India Company, such marriages are illegal, and the issue thereof would be deemed illegitimate.

"7. That Hindoos, who entertain no objections of conscience to such marriages, and who are prepared to contract them notwithstanding social and religious prejudices are by the aforesaid interpretation of Hindoo Law prevented therefrom.

"8. That, in the humble opinion of your petitioners, it is the duty of the Legislature to remove all legal obstacles to the escape from a social evil of such magnitude which, though sanctioned by custom, is felt by many Hindoos to be a most injurious grievance, and to be contrary to a true interpretation of Hindoo Law.

"9. That the removal of the legal obstacles to the marriage of widows, would be in accordance with the wishes and feelings of a considerable section of pious and orthodox Hindoos, and would in no wise affect the interests, though it might shock the prejudices, of those

who conscientiously believe that the prohibition of the marriage of widows is sanctioned by the Shastras, or who uphold it on fancied grounds of social advantage.

"10. That such marriages are neither contrary to nature nor prohibited by law or custom in any other country or by any other people in the world.

"11. That your petitioners, therefore, humbly pray that your Honourable Council will take into early consideration the propriety of passing a law (as annexed) to remove all legal obstacles to the marriage of Hindoo widows, and to declare the issue of all such marriages to be legitimate.

"And your petitioners, as in duty bound, shall ever pray."

To Vidyasagar's indefatigable exertions the country owes the Widow Remarriage Act of 1855. Mr Buckland in his "Bengal under the Lieutenant Governors" says —

Vidyasagar was a Hindu of the orthodox type, but he felt the position of inferiority assigned to the women in India, and on their behalf he started the widow marriage movement. * * * When the Indian Legislature passed an Act in 1856 legalising the marriage of Hindu widows, the first widow marriage under the Act took place in Calcutta in December 1856. It was followed by others, both in the Presidency town and in the district of Hooghly and Midnapore. * * * The several pamphlets issued in justification of his views show unrivalled powers of reasoning as well as deep knowledge of the Hindu scriptures and legal books. To help the movement he ran heavily into debt, which he lived long enough to clear.

Side by side with his work for the remarriage of virgin widows, Vidyasagar set on foot an agitation against the practice of polygamy among the Hindus, especially the Kulin Brahmins. A memorial signed by 25,000 persons was sent up to the Government of India praying for legislative interference. The memorial stated :—

"The Koolins marry solely for money and with no intention to fulfil any of the duties which marriage involves. The women who are thus nominally married without the hope of ever enjoying the happiness which marriage is calculated to confer particularly on them, either pine away for want of objects on which to place the affections which spontaneously arise in the heart or are betrayed by the violence of their passions and their defective education into immorality.

"That the remedy, though obvious and perfectly consistent with the Hindu Law, cannot, in the present disorganised state of Hindu Society, be applied by the force of public opinion, or any other power than that derived by Legislature."

Among those who signed the memorial was the Maharaja of Barwan. But the Government had only a year before passed the Widow Remarriage Act against considerable opposition and they did

not care to venture on another piece of social legislation, however necessary.

Meanwhile, the relation between Vidyasagar and Mr. Young, the Director of Public Instruction, became strained. Vidyasagar tendered his resignation. Mr. Hilday persuaded him not to do so and on his personal request, he continued in the post for a year. But the relation between Vidyasagar and Mr. Young did not improve and he resigned ultimately in 1858. But though he ceased to be an official adviser of Government on educational matters, he was consulted by successive Lieutenant Governors on all matters pertaining to education.

In 1859 the Metropolitan Institution was founded with a view to imparting English education to the middle-class Hindu youths at a lesser tuition fee than what was charged in the Government schools. The school was at first managed by the founders themselves but after a few months they requested Vidyasagar to assist them in managing the school. He was appointed as a member and Secretary of the Committee of Management. In 1868 the sole responsibility devolved on him and he took the burden cheerfully. In January 1872 he formed a committee for the management of the institution consisting of himself, Dwarkanath Mitter and Kripodas Pal as members and raised the institution into a second grade College. Vidyasagar engaged the most distinguished Indian scholars of the time as professors of the College and the exceptionally brilliant results produced by the institution attracted many students from other colleges. In 1879, it was made a first grade College. The institution also had an attached school of 800 boys and four or five branches in different quarters of the City of Calcutta. At a cost of one and a half lakh of rupees Vidyasagar raised a magnificent building for it.

On the new year's day of 1880 the distinction of C I E, was conferred upon Vidyasagar. He

was by nature averse to such distinctions and declined the title. After much persuasion he was induced to accept it. Three years before certificate of honor was presented to him "in recognition of his earnestness as leader of the widow re-marriage movement and position as leader of the more advanced portion of the Indian community."

In 1890 the Age of Consent Bill was introduced into the Legislative Council. It was a measure which divided Hindu society as no other measure had done before. Vidyasagar opposed the bill as it was. His opinion was that *Garbhasya Samskara* was a religious usage in conformity with the *Shastras* binding upon the Hindus and as there was no certainty at what age a female might have her first menses, the placing of restriction in the age limit for the consent of the female, would be a direct interference with the religious customs of the country. In his note on the subject he wrote —

"Though on these grounds I cannot support the Bill as it is, I should like the measure to be so framed as to give something like an adequate protection to child-wives, without in any way conflicting with any religious usage. I would propose that it should be an offence for a man to consummate marriage before his wife has had her first menses. As the majority of girls do not exhibit that symptom before they are thirteen, fourteen or fifteen, the measure I suggest would give larger, more real, and more extensive protection than the bill. At the same time, such a measure could not be objected to on the ground of interfering with a religious observance."

"From every point of view, therefore, the most reasonable course appears to me, to make a law declaring it penal for a man to have intercourse with his wife, before she has her first menses."

"Such a law would not only serve the interests of humanity by giving reasonable protection to child wives, but would, so far from interfering with religious usage, enforce a rule laid down in the *Shastras*. The punishment, which the *Shastras* prescribe for violation of the rule, is of a spiritual character and is liable to be disregarded. The religious prohibition would be made more effective, if it was embodied in a penal law. I may be permitted to press this consideration most earnestly on the attention of the Government."

In February 1891 Vidyasagar went to Chandernagore where he lived a retired life. In June of the same year he had a pain in his side regions and the best medical aid given him was of no use. On the 29th July he passed away, mourned by the whole country. A grateful people have set up a statue in the premises of the Sanskrit College, but he has raised for himself by his patriotic and disinterested labours in a number of directions, a monument in the hearts of his countrymen certainly more lasting than brass or marble.

ISHWAR CHANDER VIDYASAGAR.

The 27th Indian National Congress.

THE HON. RAO BAHADUR, R. N. MUDHOLKAR,
President elect.

THE HON. MR. MAZRUL HAQUE,
Chairman, Reception Committee.

*The Congress President-Elect.***THE HON. RAO BAHADUR R. N. MUDHOLKAR.**

IN the galaxy of eminent Indians which the Mahatma race has produced, Rao Bahadur R. N. Mudholkar occupies a foremost place. For over quarter of a century he has been taking leading part in the public life of the country, but his activities have not been confined to one particular field. His interest in politics is as keen as his interest in social reform; but, if possible, he is even a yet warmer advocate of industrial development. Long before Swadeshi was talked of, he had been encouraging Swadeshi enterprises, and pleading for more organised technical and industrial education. Though confined to the Central Provinces, his activities have not been parochial and his familiar figure might be seen on all platforms,—on the platform of the National Congress, the Social Conference, the Temperance Conference, the Educational Conference and the Industrial Conference, of the last of which he is still the General Secretary. In fact, Mr. Mudholkar is an all round man and a sincere and earnest worker in the cause of national regeneration—a man, if we may say so, so various that he seems to be not one, but all mankind's epitome.

Mr. Mudholkar comes of a distinguished family, his ancestors having held the vakilship of the Mudhol State at the Darwar of the Peshwas. His grandfather served as Mamlatdar in Kandesh and his father Narasing Rao Krishna was Record-keeper of the District Judge's Court in Kandesh when Ranganath Narasing Mudholkar was born at Dhulia on the 16th May 1857. His early education was divided between Dhulia, Erandol and Berar where his brother held service in the education department. He passed his Matriculation in 1873 from the Dhulia High School and then joined the Elphinstone College, Bombay, for the Arts course. Among his contemporaries were

Dayaram Gidumal, Justice Chandavarkar, Vishnu Krishna Bhatwadekar, Dewan Bahadur V. M. Samarth, Dewan Bahadur R. V. Sabnis, Mr. V. G. Bhandarkar and Mr. G. S. Khaperde. He took his degree in 1877 and Principal Wordsworth, a shrewd judge of men, remarked, "he early attracted my attention and the expectations which I then formed of him have been fully realised. I have a very high opinion of his intellectual and moral attainments and personally a very sincere regard for him." This was no mere praise indeed.

Soon after taking his degree he was appointed Fellow of the Elphinstone College and was teaching History, Logic and Political Economy. He passed his LL B in 1880. Even in the early eighties the Bar in Bombay was overcrowded and the cry was, "still they come." Mr. Mudholkar preferred immediate success elsewhere to early struggles in Bombay and therefore decided upon practising in Berar where he and his brother-in-law, the late Mr. Divekar, were the first LL B's. He set up practice in 1881 at Akola, but shifted next year to Amraoti where the Court of the Judicial Commissioner was removed. Since the commencement of his life he has enjoyed a lucrative practice and he has practically led the Bar.

From the very time Mr. Mudholkar settled in Berar he began to take an active interest in the public life of that province. In any part of India public work has to be carried on under peculiarly difficult circumstances. There are no prizes for the public worker in India, and he cannot after a few years' apprenticeship look to fat births and places of preferment. The doors of official life are closed to him and the few who have risen to official eminence have done so not because of their services to the country, but in spite of them and because of their own sterling worth. In any country the prizes of public life are always tempting, but in India its dangers and risks are insurmountable. Friends will throw cold water on us

for wasting time and energy on what they regard as profitless tasks, while foes are only too ready to stab us in the back. Sometimes one's honor and reputation are at stake. If this is so even in advanced provinces, what would the conditions have been in a province like Berar and about thirty years ago? It was not a question of taking part in public life with Mr. Mudholkar, but of creating and organising it.

In that work he was assisted ably by Mr. M. V. Joshi. They started the Berar Sirwajanik Sabha in 1886 and though it did not earn the name of the Poona Sirwajanik Sabha or the Bombay Presidency Association, did useful work, and was the means of keeping the Government informed of the views of the public on all administrative questions. Most of the representations which the Sabha made to the Government were drafted by Mr. Mudholkar, who was Secretary till 1893, and among these may be mentioned as especially noteworthy the memorials on the separation of judicial and executive functions in Berar, revision survey and settlement, agricultural indebtedness and land alienation and the propriety of extending the Deccan Agriculturist Relief Act to the rest of India. The Sabha was not the only medium through which public opinion was formed, and Mr. Mudholkar helped in the starting of a newspaper called *Vandharba* which derived considerable advantage by his frequent contributions to it so long as it lived.

With Mr. Mudholkar politics was not a mere pastime. It was not the means of whiling away a leisurely hour. It involved serious study of the many-sided problems. Politics in fact cannot be divorced from Economics. Both must be studied side by side. Mere political advancement unaccompanied by the development of the material resources of the country cannot avail. His deep study of the economics of industry early warned him against one-sided progress. Though not a captain of industry himself, he early began to take

a deep interest in industrial questions and his contributions have been valuable. In his own way he began to do what he could to help in the material advancement of the country. His very first public act in Berar was the establishment of the Berar Trading Company with the co-operation of some friends. He himself acted as its Secretary at the start. Four years later with Rao Bahadur D'orao Vinayak and Mr. Jukrishna Begaji he started the first factory in Berar and the initial loss, though it provoked ridicule and censure, was soon met and the share value which had dropped to one half raised soon fourfold. Some years after an Oil Pressing Factory to which was added a ginning factory was started and it is managed now by his brother. Two companies were formed in 1901 for carrying on ginning and pressing operations at Amraoti of which Mr. Mudholkar is one of the largest shareholders and a third was formed in Akola District in which he has substantial interest. Mr. Mudholkar is thus not a man of words and he has given ample proof of his own earnestness in helping forward the industrial revival of this country.

Mr. Mudholkar had long been anxious to give the educational system a scientific and industrial turn, feeling which to start purely Technical schools. So far as Berar was concerned an opportunity came in his way. When it was proposed to have a memorial on the demise of Her late Majesty Queen Empress Victoria, Mr. Mudholkar was consulted and he promised to join the movement provided it was given the shape of a technical or industrial school. The officials and non-officials were in favour of the proposal. When Lord Curzon's opposition to the scheme was made known, it did not meet with approval from official headquarters. But the officer who opposed soon went away. A lakh and fifteen thousand was collected by the committee and by the time a plan could be matured, Mr. Hewitt was the Chief Commissioner and he was sympathetic. Again Lord Curzon's

Government declined to allow the scheme to sail smoothly. But Mr. Hewett became member for Commerce and Industry and Sir Frederick Loly who succeeded him was a good friend of the movement. The Government gave Rs. 30,000 as an initial grant and Rs. 11,300 for maintenance expenditure and Rs. 1,300 for Municipalities. Thus through Mr. Mudholkar's exertions Barar is provided with a good technical school.

At a meeting of the Imperial Legislative council last year he moved the following resolution:—

"That this Council recommends to the Governor-General in Council that the Government of India do take early steps to establish a Polytechnic College, for giving instruction in the higher branches of mechanical engineering, electrical engineering, marine engineering, railway engineering, textile manufacture, mining and metallurgy and the different departments of industrial chemistry, and that a Committee of qualified officials and non-officials, European and Indian, be appointed to frame and lay before the Government by the end of August next a scheme suitable for the requirements of the country and capable of being carried out in the immediate future."

In the course of a very able speech in which he moved the resolution he traced the history of the question from the earliest times when neither the *Education Despatch of 1854* nor the *Education Commission of 1882* did any justice to the need for technical education. The subject was taken up in 1888 during the Viceroyalty of Lord Dufferin when Sir Antony Macdonnell reported that "it is no exaggeration to say that of the 45 industrial schools which now exist in India hardly one serves any true educational purpose." The Governor General endorsed this view and issued a resolution impressing upon the local Governments the need to form a Committee of educational experts and professional men who should make suggestions from time to time for the auxiliary supply or appropriate means of technical education and when the circumstances are opportune to establish a technical school in each province.

Although the Government of India did not approve of his resolution to appoint a Committee of qualified persons, to frame a suitable scheme for an all India polytechnic College, they did so

because they wanted time to be given to the development of the experimental institutions now started. It is no doubt a matter for sincere regret that the resolution has been negatived and that the Secretary of State for India has also vetoed the proposal to establish a polytechnic institute at Cawnpore. The Secretary of State has undoubtedly been ill-advised and the step that has been taken by the Government to give technical instruction in accordance with the recommendation of Sir Antony Macdonnell in 1888 is hardly creditable to them. It can hardly be contended that there is no need for higher technical and scientific learning. As Mr. Mudholkar pointed out in his note on Technical Education submitted to the Educational Conference recently held at Allahabad under the sympathetic chairmanship of Mr. Butler, there is wide scope for it. There are in India 242 cotton mills, 57 jute mills, about 1,100 cotton ginning and pressing factories, and 130 jute presses. Then there are many oil mills and sugar factories and there are over 2,500 factories owned by individuals or private companies worked by mechanical power. The owners of most of the well-managed ones would be glad to put them in charge of superior engineers. Many large establishments import their engineers, mill-managers, spinning and weaving masters, their textile chemists and other expert staff from Europe. Is there no scope for trained Indians here and is there no need for a polytechnic institute to train men for these concerns? We hope the creation of a separate education portfolio and the appointment of Mr. Butler in charge of the Department will give a fillip to the cause of technical education in India.

While education is the first need for industrial revival, the second is an industrial survey. It is a matter of urgent importance that people should know the state of the existing industries and the chances of their revival and perhaps it is partly on such knowledge that the curricula of studies

can be framed for the different provinces. The Committee on Industrial Education appointed by the Government of India pointed out in their report that they found it extremely difficult to make *workable and practicable* suggestions for want of an adequate survey showing the present condition and future possibilities of existing industries, and they strongly urged upon the Government the need for such a survey. As Secretary of the Indian Industrial Conference Mr. Mudholkar sent a Memorial to the Government of India and it is well-known that some of the Local Governments have practically sympathized with his object. But a comprehensive report for all India is an absolute necessity and unless it is forthcoming, an adequate knowledge of the present and prospective condition of Indian industries cannot be had.

The keen interest which Mr. Mudholkar has been taking in the industrial revival of the country has not gone unrequited, and, when the Indian Industrial Conference was started in 1906, he was unanimously elected Secretary. The fact that many Captains of industry might have been chosen and were not preferred, shows the hold he has on the public and the regard his friends have for him. The object and scope of the Conference may best be stated in his own words:—

(1) To obtain from qualified persons, papers and suggestions bearing on industrial questions, with a view to promote their consideration and discussion by those who are in a position to do so and to spread general knowledge amongst the uninitiated;

(2) To form Associations and Committees throughout the country for promoting industrial development by starting new manufactures and encouraging the existing ones;

(3) To secure the establishment of a complete and well co-ordinated system of Technical and Industrial education—primary, secondary and higher.

(4) To have an industrial survey, that is, a fairly full of accurate knowledge of the industries existing now in the country, their condition, their prospects as matters stand, their capability of expansion and the facilities needed for accomplishing this advance;

(5) To prepare and issue publications like Directories, Bulletins, etc., calculated to stimulate the production and consumption of indigenous articles;

(6) By prizes and otherwise to encourage the improvement of appliances and processes used in the different existing crafts and manufactures to raise their efficiency at a cost which will bring them within the reach of the ordinary artisans and the small capitalists; and

(7) By lecture, leaflets, pamphlets, etc., to rouse general interest and secure systematic action in the cause of industrial expansion.

For five years the Conference has been doing quiet, useful, unostentatious work and no doubt the credit is largely due to him. If it has not been able to perform all that it has set before itself to do, it has given rise to a deal of healthy literature on the subject. It has created and stimulated interest in industrial questions and the papers annually collected and published by the Conference contain much valuable information for people to profit by. There is no disguising the fact that the interest is not being sustained throughout the year and that local organisations are not putting forth the best in them to co-operate with the central organisation. But the Industrial Conference suffers from that national weakness in common with its sister movements. All the same the interest it has created within these five years and the large body of support it has evoked are a hopeful augury, and should we ever take a prominent place in the industrial and manufacturing nations of the world, no small part of the credit will go to the Industrial Conference which has kept alive in us what may be called the "industrial conscience."

As a token of the appreciation of his services he was called upon to preside over the Second Central Provinces and Berar Provincial Industrial Conference, and the fourth Indian Industrial Conference held in Madras. In both the presidential addresses he made eloquent plea for the Government taking greater interest in the industrial well being of the people than they have been doing. He pointed out that our well being in the immediate present and our progress in the future are as much dependent upon the establishment of a healthy condition of industrial activity

as upon political advancement or social reform and the same self-sacrifice and devotion are required from our public men by the first as by the other two. In fact, he continued that most of the political and social questions which confront us and make urgent demands upon our close attention are at their base economic. It is only by a full recognition of the intimate connection and interdependence of these three spheres of activity that it is possible to ensure a healthy existence for the nation.

Mr. Mudholkar joined the Indian National Congress in 1888 when it met in Allahabad under the presidency of the late George Yule. Since then he has attended almost every Congress and has taken part in its deliberations every year. He has always spoken on economic questions and very soon made a mark. He so much impressed the Congress leaders by his mastery of the politico-economic questions that he was appointed at the Bombay Congress next year as a delegate to England along with Babu Surendranath Bannerjee, Mr. Eardley Norton, and his fellow-townsmen Mr. M. V. Joshi, to plead for the reform of the Legislative Councils. To look only twenty years back, the Legislative Councils were in a condition which can only be called shams. There was no election of the members and the nominated Councillors met only when there was a financial proposal demanding consideration. The state of the Council has been well described by Raja Rampal Singh, who had a relation of his in the Imperial Legislative Council. This gentleman did not know English—even now a knowledge of English is not considered necessary in some councils—and when he was asked by the Raja how he was guided in giving his vote, he simply said, “why, I held up my hand when the Viceroy held up his, and dropped it when he did.” That was the state of things for the removal of which the deputation was sent up to England. It was a happy augury, said a writer in the Press in wel-

coming them, that Mr. Mudholkar and Joshi are living in the apartments occupied by Benjamin Franklin when he came to England to represent the causes of the American colonists a hundred years ago!

While the reforms that Mr. Mudholkar and his friends went on deputation to plead for, were of such an elementary character as the expansion of the Councils on a representative basis, the amount of work they had to do in England was, undoubtedly tremendous. They had to remove an amount of ignorance which was truly colossal. Macaulay has depicted to us in a memorable passage the total indifference of the British public to Indian questions and after a year's stay in England Sir Pherozeshah Mehta has come back with the conclusion that the amount of ignorance that prevails even in well-informed quarters is phenomenal and that our real work lies in dissipating it. If that is so now, it is possible to conceive what it would have been twenty years ago. Opposition one can welcome and account for. But a Himalaya of ignorance cannot be removed in a few lectures however gifted and powerful the spokesman may be. And it reflects considerable credit upon Mr. Mudholkar and his friends that they were able to create an interest in Indian affairs among the British democracy, and to their spadework perhaps was due the very little opposition that was gathered round the Reform Bill of Lord Cross.

Mr. Mudholkar is not an orator, but he is gifted with the power of expressing his views straightforwardly and in a few happy sentences and if he failed to carry audiences, he brought home to his hearers in a few terse sentences the justice of the cause he was advocating.

In 1897 Mr. Mudholkar invited the Congress to Amraoti. It was a year of great trouble in the Maharashtra. The Poona murders and the campaign of press prosecutions, leading to the conviction of Mr. Tilak of sedition, 1

profound impression on popular minds. The Government was suspicious of the loyalty of the educated classes. The Congress, it was hoped, had lived down the charge of sedition levelled against it by machine-making persons, but the enemies of the country made party capital of the conviction of Mr. Tilak. It was a question of holding the Congress or not at all. It was necessary that if the Congress was to maintain its reputation as a body of level-headed politicians, loyal to the Throne, and at the same time anxious for the redress of our legitimate grievances, it should be firm in its demands but give no quarter to the seditiously inclined. It was the year in short which put our statesmanship on trial and there is no doubt that the success of the Congress was due as much to the good sense and patriotism of the rank and file as to the wisdom of leaders like Mr. Mudholkar who invited the Congress and worked incessantly for the satisfactory conclusion of its labours.

That perhaps does not exhaust the services he had rendered to the Congress. No less remarkable and valuable were his services ten years later when the Congress was proposed to be held in Nagpur. Nobody, not even Mr. Mudholkar and his friends, was able to apprise the machinations of the enemies of the Congress in the early months of 1907, but the truth dawned upon him very soon. We shall perhaps not know the endeavours which he in common with many of his friends did to prevent the change of venue from Nagpur and it was only after all endeavours to pacify Dr. Munje and his friends who set up the row had failed that he finally threw in his lot with those who shifted the Congress to Sarat. And even then Mr. Mudholkar might be seen closely conferring with leaders of every kind advising co-operation. He met and spoke to every group of Congress delegates counselling co-operation and asking them to run the Congress on the usual lines. Though a moderate, he

never wanted secession and did all that he could to prevent it. From early morning till late in the day he could be seen busy going round the camps addressing meetings and pleading for not wrecking the movement they had worked for well nigh quarter of a century to build up. But his voice proved a voice in the wilderness.

Early in the same year he was invited to preside over the third session of the Central Provinces and Berar Provincial Conference held at Raipur. As may be expected the speech was an excellent summary of the Congress demands for the separation of the judicial from executive functions, for a Legislative Council to the Central Provinces and Berar, for more literary, scientific and technical education, and it strongly condemned the land revenue assessments. Anticipating as it were the secession of December he summed up his political faith in these words—

Self Government is the goal of our political ambition because it is only an autonomous nation which can afford scope and supply facilities for the development of those intellectual powers and that moral and spiritual fervour which must be possessed by the citizens before they can take their share in the evolution of the human race. Such autonomy for India is not beyond the range of practical politics when some of the wisest and best men of England admit its justice and contemplate its grant. It is not an impossible or impracticable claim which we advance. It is not merely speculative considerations or abstract principles on which we rely. We take our stand on the firm ground of statutory rights and royal pledges (hear, hear), the combined wisdom of the three Estates of the British realm laid down in 1833.—

While Mr. Mudholkar enjoys the confidence of his countrymen, he commands the respects of the Government in no small measure. On almost all questions affecting the well being of the people of the Central Provinces he has been freely consulted and his advice has been unstintingly given. He gave valuable evidence recently before the Decentralisation Commission. On behalf of his old province he put in this plea—

The districts forming the Central Provinces and Berar (with if possible Sambalpur and Chota Nagpur also) should be formed into one province and placed under a Lieutenant Governor. There should be a Board of Revenue consisting of two of the senior Commissioners and one head of a Department. There should be an Advisory Council consisting of half nominated

and half elected members with defined functions and powers and there should be a Legislative Council of 36 members (exclusive of the head of the administration) half of whom should be elected. If these changes are made the Provincial Government might be invested with the fuller powers suggested in regard to Madras and Bombay.

Although Mr Mudholkar was one of the oldest Congressmen who pleaded for the expansion of the Legislative Council, it was not given him to become a member of the legislature. The chief reason undoubtedly was the fact that the Central Provinces and Berar had no Council of its own. It is an open secret that he was many a time, recommended for a seat in the Imperial Council but it was only last year that he was nominated. Of his work in the Imperial Legislative Council there is no need to speak much. He has been constantly taking part in almost all the debates and his earnestness has left a deep impression on the Council. The very first speech that he delivered was on the Press Bill and though he supported it he pleaded for the provisions of the Bill being used with judicious discretion. He supported the resolutions of Mr. Gokhale on the question of the status of Indians in South Africa and on the extension of primary education. During the budget discussion last year he pleaded for an extra two lakhs being given to his province for education. He moved a resolution in favour of the establishment of a polytechnic institute to which we have already referred and joined Mr. Gokhale in pleading for a reduction of public expenditure.

He seconded Mr. Gokhale's resolution asking for a committee to enquire into the growth of public expenditure and spoke in favour of Mr. Haque's resolution to increase the grant of the Government of India to local Governments to an extent that may be needed to abolish the raising of fees from primary schools. He also supported the resolution of Mr. Dadabhai for the abolition of cotton excise duties.

The question of the employment of Indians in the higher branches of the Services came for dis-

cussion on the motion of Mr. M. Subba Rao and Mr. Mudholkar in the course of his speech in support of the resolution confined his attention only to their employment in Public Works and Railways and the following facts he adduced are interesting :—

Sir, taking the State Railways managed by the State we find that there are in the Engineering Department 30 Chief Engineers and Superintending Engineers on salaries ranging from Rs. 1,500 to Rs. 2,750. There is only one Indian officiating in the third class in this branch. There are 50 Executive Engineers on salaries ranging from Rs. 700 to Rs. 1,250, of these 7 are Indians. There are 50 Assistant Engineers on salaries ranging from Rs. 350 to Rs. 600, of whom only 2 are Indians. There are 33 Royal Engineers (Executive Engineers and Assistants) on salaries ranging from Rs. 550 to Rs. 1,270 none of whom are Indians. There are 24 temporary Engineers on salaries ranging from Rs. 500 to Rs. 1,250 of whom only one is an Indian. That is out of 100 persons on salaries ranging from Rs. 500 to Rs. 2,750, there are only 11 Indians. Let us take another department of the railways, the directing one viz the Managers and Sub-Managers. There are eight posts with salaries ranging from Rs. 1,300 to Rs. 3,000, and there is no Indian amongst them. Then the Traffic Department—the Superintendents and Deputy Superintendents and District Superintendents, whose number is 50, on salaries ranging from Rs. 600 to Rs. 2,000, of whom there is only one Indian on Rs. 700. There are 62 Assistant Superintendents on salaries ranging from Rs. 250 to Rs. 500, of which only 7 are held by Indians. In the Locomotive Department, in which there are about 100 appointments on salaries ranging from Rs. 250 to Rs. 2,000 there is only one Indian who is an Assistant Superintendent, and he too is an Honorary Assistant Superintendent. In the Carriage Department there are 15 places on salaries ranging from Rs. 350 to Rs. 1,600, and there is not one Indian employed. In the Stores Department there is only one out of nine. In the Bridge and Signalling Departments there are 12 superior posts carrying pays up to Rs. 1,050, none of which are held by Indians. The tale does not stop there. If we go to the Subordinate Revenue establishment even there we find that among the subordinate engineering staff consisting of 42 persons on salaries ranging from Rs. 250 to Rs. 500 only 4 or 5 are Indians. In the Signalling Department there is no Indian. In the Traffic Subordinate Branch, including traffic inspectors and station-masters out of 72 persons on salaries ranging from Rs. 250 to Rs. 600, there are only 4 Indians. In the Locomotive Department, out of 131 upper subordinates, only one is an Indian.

Mr. Mudholkar has been in the Imperial Legislative Council only for the last two years. His close and intimate study of public questions compel the attention of the Council and his deep earnestness secures to him its respect. And these are the qualities that are required in a public

man. And that was why he was invited to attend the Educational Conference held at Allahabad a few months ago under the Chairmanship of Mr Butler. We have already referred to the note that he placed before the conference and it is wellknown that the Conference was deeply anxious to further the cause of higher technical education to which Mr Mudholkar addressed himself.

Love of his fellowmen and service to his countrymen have been his motto and he may always be expected to be at his post when duty called him. Perhaps no work gave him greater pleasure than to relieve the poor and the distressed and whenever famine visited his province he was ready to help the starving and the poor. The failure of the rains in 1896 which brought about a severe famine in the Central Provinces, Northern India and the Deccan produced in Berar also great scarcity and high prices. The project of selling grain at rates below the market rates and establishing kitchen for the very poor unable to work, was resolved upon by him and Mr Joshi and the proposal was accepted by other non-officials and the Commissioner and other European officials. In March 1897 a branch of the Indian Famine Charitable Relief Fund was started in Berar and Mr. Mudholkar entered on the work whole-heartedly. In 1898 the title Rao Bahadur was conferred upon him in recognition of his work. In 1899-1900 came another great famine, perhaps the greatest in the century and Mr. Mudholkar acted again as Secretary to the Famine Fund.

Mr Mudholkar has always taken a keen interest in social reform. In a paper which he prepared many years ago he made a strong plea for marriage reform among the Hindus. He recommended the age limit both for the marriage of boys and girls being raised. He does not advocate the abolition of caste, but is for the gradual fusion of the sub-castes. He advocates the remarriage of virgin

widows basing his conviction on the Parashara Smriti.

He was offered by the late Mr. Ranade the Presidency of the fifth Indian Social Conference held at Nagpur in 1891 but his modesty precluded him from accepting it.

He is not a prolific writer in the press, but he does not discontinue contributing to the periodical literature whenever time permitted him to do so. We have already referred to his services on behalf of the *Lamabha*, but he was also freely contributing to the *Indu Prakash*, now edited by his friend Mr D G Pathy, M. A. To Mr. Natesan's *Indian Politics* he wrote a valuable paper in which he surveyed the economic condition of the people of India. The paper is an interesting one and in the course of it Mr Mudholkar drew pointed attention to the economic destitution of the people and examined the causes that have contributed to it. He is still in the vigour of youth and has many years of active usefulness before him.

THE CONGRESS

Movement. Leaders. Subjects.

The Indian National Congress—An account of its origin and growth. Full text of all the Presidential Addresses. Reprint of all the Congress Resolutions. Extracts from all the Welcome Addresses. Notable utterances on the Movement. Portraits of all the Congress Presidents. Cloth Bound. Over 1,100 pages. Crown 8vo. Rs. 2. To Subscribers of the "Indian Review," Rs. 1.8.

Dadabhai Naoroji's Speeches—An up-to-date, exhaustive and comprehensive collection. With a portrait. Rs. 2. To Subscribers of the "Indian Review," Rs. 1.8.

Recent Indian Finance—By Mr. Dusha Edulji Wacha. A valuable collection of papers relating to Indian Finance, etc. Price Rs. 4.

Indians of South Africa—Hottel within the Empire! How they are treated. By H. S. L. Polak. Rs. 1. To Subscribers of the "Indian Review," Rs. 12.

Gokhale's Speeches—An exhaustive and comprehensive collection of his speeches, with a biographical sketch and a portrait. Over 1,000 pages. Crown 8vo. Rs. 3. To Subscribers of the "Indian Review," Rs. 2.8.

Dr. Rash Behari Ghose's Speeches—Rs. 12. To Subscribers of the "Indian Review," Rs. 8.

G. A. Natesan & Co., Sunkurama Chetty Street, Madras.

THE PRESIDENT-ELECT OF THE CONGRESS.

DECORATING HIM FOR THE PRESIDENCY

[The Secretaries of the All-India Congress Committee, Messrs. D. E. Wacha and D.A. Khare, have informed the Bihar Reception Committee that the Hon'ble Mr. Mudholkar having been elected President of the coming Congress by 39 votes, has accepted the office.]

[With the kind permission of the *Hindī Punch*.]

THE RENAISSANCE IN INDIA

BY

MR. K. T. PAUL, B. A.

*General Secretary to the National Missionary
Society of India.*

If I were asked to select the term best suited to describe the peculiar nature of the change which India is undergoing I should decidedly prefer the one adopted by a friend who has just written a book on the subject and called it the 'Renaissance in India.*' A quarter century ago the regular terminology was 'India in Transition.' Last decade and almost up to date we heard of the 'Unrest in India.' To-day we get a new phrase 'The Renaissance in India,' and it seems to me that this latest arrival denotes more truly the state of affairs than any of its predecessors.

'India in Transition' indicates nothing as to the character of the change, either in its roots or in its expected fruits; the only implication is that the change is inevitable and certain. The other phrase 'Unrest in India' is even more fragmentary in nature; it merely indicates that the deep waters are being agitated; gives no information as to whether the waters will overflow in healthy life-giving streams or merely eddy in increasing muddiness and cankerous unhealthiness. In contrast with these stands the new term 'Renaissance' as a great flash-light illuminating the past far-away backwards, interpreting in wonderful clearness much of the tangles of the present, and indicating with courageous definiteness the direction of the future.

To obtain real profit from such an interpretation of new India one should study afresh the state of our country at the period when Macaulay and Raja Ram Mohan Roy brought about the ever-memorable innovation. It is not recognised widely or adequately enough that the history of

India runs really in two almost parallel lines. The ordinary reader sees nothing beyond the political history of the country. But this is only the exterior history of India. All along the centuries, amid the vicissitudes of this exterior political history, the inner life of the Indian peoples has pursued independent lines of progress. While it cannot be pretended that the one did not at all react on the other, is it not a fact that such great things as the rise of Sankara and some four centuries later the advent of Ramanuja were due to things, and led to others, quite independent of the political history: and if four or five centuries later the outburst of the Reformation in North India through Chaitanya, Kabir and Nanak was due to conditions brought about by political circumstances, the actual working out of the Reformation itself was quite independent of political concomitants? To construe the modern Renaissance aright we have to direct our attention to the inner history of our peoples. And when we do so we are saddened beyond measure by the revelation of the fact that the century previous to the advent of Western culture was a period which can only be described as a Dark Age. The days of the giants, even the last of them, was quite ancient history. The vigorous and courageous age of the Reformers and Revivalists had closed; the days of Chaitanya and Kabir, of Tukaram and Manikkavasar were done. The Mahamadan influence first in the rigour of its empire and next in the tyrannies consequent on its dismemberment hung like a dark cloud over the entire Hindustan. The religio-political activity of the Mahrattas was the only feature worthy of Hindu life; if the career of the Maharattas had not been checkmated by the British, they would certainly have overrun the whole land and impressed their spirit on it most deeply; a chapter might then have been added to the inner history of the country which would have had a character of its own; but the day for such a development was fated

* By the Rev. C. F. Andrews, Delhi.

admission of all things foreign leading to the destruction of all that is native. But it was equally a protest against the senseless desire that India should continue where it was, totally unaffected by anything foreign. If it were so, the Dark Age had triumphed and the impact of the West had been of no avail. The Swadesi cry was really expressive of the double barrelled implication of the new self-consciousness. 'India is also something; nay, she has been great; she can yet be greater once more; let us her children rise to the opportunities of the times, save her from the death of self centered conventionality on the one hand and on the other from effacement by the all-too strenuous impact of the West. India does have a future yet and we shall lead her forward to her place in the sisterhood of nations.'

The Swadesi cry combined three great feelings. There was the intense patriotism which sang itself in 'Vande Mataram,' in the exuberance of its passionate love for the great glorious motherland. There was also in it a note of pathos, a frank recognition that she was yet far from her goal. Then there was the zealous determination that she shall follow the same lines which have carried other nations into prominence. The cry of Swadesi was terribly misunderstood both in India and in England. Outsiders saw in it only the passionate adoration for the motherland and failed to realise that it implied in an equal measure the adoption of Western methods for the attainment of the new aspirations. Outsiders thought that it was a revolt against Western influence: in reality it was the firing of the mine which broke through the exaggerated conventionalism of the Indian Dark Age.

To interpret New India in this way as a Renaissance is to subscribe to another very important truth. Society is in the nature of an organism. It can assume nothing new which is not connected with the old, the fruits of its future must necessarily feed through the roots in its past. Where a

cataclysm brings about a radical revolution, there inevitably comes sooner or later a counter revolution, and this leads on to a third stage where progress is forced into the normal channel connected with life streams of the past, going forward in natural gravitations to the blessings of the future.

If social organism anywhere is so conservative of its past, the specimen that we find in India is undoubtedly the most conservative of them all. And yet it does not mean that India has never changed it has really to change in almost every generation. If one could think of an Indian of the Vedic times living in the forests of the Himalayas to this time and emerging into the world once in every half century, in all probability he would be struck more by the extent of the changes than the conservation of things. Nevertheless a comprehensive vision of the entire history of our country provides us with a vantage view point which reveals to us more truly the force of our conservatism. That we are moving forward is a certainty equalled by the fact that the directions of our forward movement are regulated by our inheritances from the past.

The Renaissance then is not a birth but an awakening. As in Europe, so here, it indicates that there was life before the Dark Age and that as the result of the consequences of certain political circumstances the old life shook off the power of death over it and has risen again in the freshness of a second birth. The forces which were instrumental in the awakening cannot but continue their influence all through the future. But the dominant factor is certainly the old life now rejuvenated with all the characteristics both ill and well.

It is illuminating to examine our aspirations in the light of this interpretation of our Renaissance. It reveals to us as nothing else does both our possibilities and our difficulties, and indicates to us the right ways and means for the attainment

of our aspirations. We shall consider a few of them

The Swadesi cry was immediately implicated with the two great aspirations of economic and political advancement. Bengal hastened to prescribe boycott as the method for securing the development of our industries. When you come to examine it closely the boycott method is not so unreasonable as it at first sight appears. Most nations have some sort of protective arrangement to prevent the unfair competition of foreign manufacturers and to secure the time required for the development of native industries to come up even with others in the market of the world. The cotton textiles to which the boycott method was principally applied are even now an example of extreme unfairness of treatment. As H. E. the Governor of Bombay perforce complained last month there is really no hope for normal progress so long as Lancashire guides the trend of things. In such a contingency the only substitute for a protective tariff seemed to be the boycott, and the immediate expansions of industry endorsed for a time the wisdom of the method. But the whole thing failed very fast for the sentiment behind it spent itself out in about a couple of years. The failure of this movement is one of those phenomena which it is profitable to examine in the light of the interpretation furnished by the analogy of the Renaissance.

The industrial aspiration was one of the results of the new born self-consciousness. India had once industries of world wide reputation. She still has abundance of the same raw materials and her sons ought to achieve even better results than their ancestors. The repressions of the Dark Age must go, for they forbade freedom of occupation across lines of class and caste, limited the possibilities of enterprise, world wide trade and world wide exchange of knowledge and locked up capital in the steel sheets of distrust. Certain Western methods must be frankly introduced,

dignity of labour learnt, freedom in the choice of vocation secured, business methods of organising labour and capital both in joint-stock and co-operative principles adopted. We must learn from the best teachers, adopt the most efficient means applicable to our resources, seek the most profitable markets—all these not on a narrowly Indian but on a world-wide basis. It is only then that India can attain and exceed that material prosperity and industrial development towards which she was progressing before the repressions of the Dark Age. But the aspiration cannot be attained by the aid of the boycott method nor can it be by the multiplication of Industrial schools. If the finger of scorn is pointed out at the failure of the boycott movement, one could reply sufficiently by enumerating the numbers of young men who have obtained industrial equipment in Indian and foreign institutions and are either without work or have had to enter one or other of the so called learned professions. Consider for a moment, and the cause of either failure is the same. The Dark Age is not yet fully gone the Renaissance has not yet gripped the entire populace. To secure these a rational system of education must be made to reach down even farther and wider than heretofore. To cite one instance from current problems, the Railway question in South India need not be begging about as it does to London and Samla, but for the persistence of the Dark Age on us. There is money enough in the country to launch the scheme and there is business talent enough to conduct it to successful issues. But the Renaissance has still work to do in and among us before our Industrial aspirations can be put on satisfactory tracks.

Our Political aspiration was no less a child of the Renaissance. India is an entity with a well-defined individuality. How much so ever complex and heterogeneous our racial conditions may be, it is undeniable that India is in a very real sense one and single. But she is not what she might

have been. The British Raj is in a hundred ways a veritable God sent for the realisation of her undoubted destiny. But the evolution of her National life can be carried forward to the particular heights which are her place in the world, only when her own sons come to have practically a free hand in the matter. 'Autonomy on Colonial lines within the Empire' thus comes to be defined as our goal, however distant the realisation of it may be. A wise and sympathetic government has come to recognise it as a legitimate and natural aspiration, and has taken measures which are deliberately forward steps in that direction.

The result is that we are put on trial. We have all gone into a great school. From the village union upwards to the Viceroy's Council and including all sorts of Committees, Commissions, Conferences and Congresses, the great school is in session. Success in the least of these is really a contribution to the success of the whole Nation. Failure in any of them ought to be branded as high treason.

The difficulties which face us here also arise from the fact of the dire Dark Age. For two centuries, excepting in Maharashtra, national patriotism was absolutely unknown, for the simple reason that it was impracticable. The Dark Age made a virtue of an evil necessity and set up the ideal of parochial and sectarian wellbeing. Coimbatore must be served as against Salem, for the senseless reason that the one is Coimbatore and the other is Salem and vice versa. So also the Brahmin interest looms up as against that of the non-Brahmans and vice versa. The divisive factors crop up at every town in public life. Merit and character are not the chief criteria of judgment. In fact it is not unknown that a wicked public official comes to be sedulously screened and protected on purely sectarian grounds; the effect of which is that the sect is exalted as against the whole world.

Again the manifestation of public spirit is still utterly inadequate in extent. The current ideal of the Dark age was the conservation of the material wealth of the sect and the family. In opposition to this the Renaissance brings forth a 'Servants of India Society' and presents the new ideal of a whole-life sacrifice for the sake of the country. There is acclamation on all hands and the principle is recognised as the necessary element for success all along the line. But it is wonderful how even the new ideal is being captured by the old. Public positions and honours are indeed zealously sought. How often are they not made use of as opportunities just for promoting the interests of the individual, the family or the sect. Flagrant jobbery is indeed everywhere condemned, but when self-seeking takes the form of promoting the interests of a sect, the culprit is not merely condoned, but even openly lauded. I speak of my own community when I say it. but I fancy ours is not the only community with this fine record.

To look at the same evil from another viewpoint, is it not notorious that the streets of our towns get visited by our leaders very systematically at election seasons and never again in the intervening triennium! Not a whole life sacrifice but the donation of a meagre hour or two a day is all that Municipal service needs. Even this is grudged, by some for base monetary reasons and by others because of the false dignity which shrinks from spade-work. Utter disinterestedness in public spirit and a sense of public responsibility are among lessons which the Renaissance has to instil into us, in opposition to the spirit of the Dark Age.

When lessons of this elementary nature are still to be learnt, how can we face what is probably the greatest of our problems, the problem of Unity? Of the 313 millions who form our nation, 66 millions are Mahomedans, that is to say more than a fifth of the whole. In the Dark Age we

are taught to conserve our own and keep quite clear of the stranger. The National ideal of the Renaissance is diametrically opposed to such a prescription. In the light of this it is almost pathetic to see the mutual hand stretchings of the promoters of the Denominational Universities of the North. The identification of interests necessary for effective National unification cannot be achieved by dramatic demonstrations on public occasions. The problem is one that is really spread piece meal over the whole country. It must be in its practical bearings studied, points of contact discovered, opportunities of fellowship actually created, and in this way the dragon killed out inch by inch.

The Social aspirations of New India probably form the hardest of the problems. But they too are the inevitable fruit of the Renaissance. It is significant for example that the feeling for the depressed classes should arise at the same time as the Swadesi Movement. The divisive tendencies of the Dark Age had exaggerated the Caste system to a ridiculous and suicidal extent. To condemn a sixth of the population to the degradation of the untouchables, is from a national point of view, to say the least, a senseless wastage of asset. Christian Missions working among these classes demonstrated by their signal successes how really valuable material was being lost to the country. If India is to come to her own goal it could not be effected so long as this injustice and wastage were perpetuated in. Thus in another point the Renaissance broke through the Dark Age.

The inevitable development of the new feeling must mount to all the rungs of the social ladder and ultimately set free the career of Social Evolution. In Bengal where the Renaissance has had the longest and widest chance as yet, the Bill of the Hon'ble Mr. Basu indicated unmistakably the signs of the times. The apparent failure of this Bill like the other similar reverses of New India arises from the same cause. The Renaissance

must spread farther and deeper and the Dark Age must be still further honey-combed, before all the possibilities of India can be liberated and can have the free play that they need for carrying the country forward to her own. The appended table is very significant both as to the past and to the future. It shows unmistakably that the Renaissance which has been set in motion by Western Education is already in effect enormously beyond the actual spread of literacy. It indicates at the same time that with the systematic covering of the whole ground by a well regulated system of Education the forces hindering progress must inevitably dwindle away in strength. Probably the greatest defect in our present stage is the extremely limited extent to which our women have been reached by Education. The Sovereign remedy then at the present juncture is Universal Education of both the sexes, on truly rational and national lines.

I have ventured to attempt a very inadequate interpretation of a few of our present day phenomena as the result of a Renaissance. We need never fear that our Renaissance will lead to a rude Revolution. Its springs are in an intensely passionate patriotism which cherishes everything Indian that is consistent with her true progress. The Radical school in India is truly Conservative. To say so may sound paradoxical, but it is the simple fact. Every true lover of India must therefore aim to secure the means of spreading the spirit of this Renaissance in unfettered lines in the widest possible range. It is a unique privilege to be born in India in this age. We are making history for which unborn generations will be grateful. Let us love our great Motherland and work to make her future worthy of her great past.

Table as to Literacy in India.

	Total Population.	Literate.	Percentage to the Total.	Literate in English.	Percentage to the Total.
Male	160,118,470	16,938,815	10.56	1,518,561	9.
Female	152,990,919	1,600,762	1.05	152,021	.10
Total Population.	313,115,389	18,539,578	5.91	1,670,582	.53

THE JAPANESE WOMEN.

[Letters of A Japanese Scholar to an English Friend]

EDITED BY MR. V. E. MEHTA.

MY DEAR WILSON,

THE West has succeeded in hopelessly misjudging Eastern Women in general. It says to itself, "Lo! the East is an old sinner, and has always despised women, whilst I have always honoured them." It quotes a few cynical Eastern writers to justify its condemnation of the Eastern attitude towards woman. Now, what is really the highest type of woman will always remain a difficult question to answer. But the East can at least say that its women have shown greater talents in more walks of life than have the women of the West. The full European woman is only a product of yesterday, for, her grandmother in Greece and Rome, and her mother during the Middle Ages, were more or less insignificant factors in the society of their times. The East has always given her plenty of opportunities for self-expansion, and she has made use of them with credit. But I am not going to expose the fallacies of your writers about Eastern women en masse. I am only writing about my own country which I know best.

In the early days of our intercourse with the West, during the last century, the Westerner was content to know the lower type of the geisha in our sea-ports. He did not have the same opportunities of knowing our family-life as intimately as he has now. That is the reason, I think, why he mistook every Japanese lady for Pierre Loti's "Madame Chrysanthème."

Man's attitude towards woman in early society can be judged by the position he assigns her in his Pantheon. A male principle was considered as necessary as the female principle in the Universe by us. Izanagi and Izanami, the male and female halves, had to unite in order to create Japan. Amaterasu, the Sun Goddess is our most important deity, for she is the first ancestress of our Mikado.

When you study our social life, you will find that we treat all women with great respect. We have always done so. Our great period of chivalry (Ashikaga period) taught us how to base our social life on a beautiful ideal. But, please remember, that our chivalry was not a gorgeous garment to cover over our illicit amours. It became a part of our religion, instead of being divorced from it. We treated with courtesy the young and old alike. Our chivalry was respect for the fair sex, and not mere admiration for youth and beauty alone. Mothers are revered by us in almost the same manner as we revere our ancestors. Our conception of a complete life has always been of a dualistic nature. There cannot be a man without a woman. She is the intuitive and therefore the higher part of an androgynous entity. For this reason, when talking to others, we use deprecatory words about our own wives. As they are an integral portion of ourselves, there can be nothing wrong in speaking of them in the same humble terms as we do, of ourselves. Many Europeans laugh at this habit of ours, because they do not understand our motives. Oriental manners have a deeper origin than the West. We do not kiss our wives.

not because we do not love them as much as you do yours, but because we understand the necessity of decorum much better than you do. I know how miserable I felt once, when I saw an English friend of mine, (on whom I had called) kiss and cuddle his wife who had returned home after a few hours absence, in my presence. Just as we dislike to show the richness of our garments on the outside, so too, we consider it sacrilegious to make an exhibition of our love before any eyes but our own. It would be not only a breach of etiquette but a sign of irreverence and irreligiosity on our part if we did so.

Our wives have shown those essentially womanly and therefore divine qualities like patience, deep-seated affection, and selflessness. What perfect ideas they have of love! Pronouns like "I" and "thou" have no meaning in their ideal of a married life. They do everything to please us. When they don a new 'kimono' they ask us whether we like it or not. They dress well in order to please their husbands, who are all in-all to them, and not to excite the jealousy of others. Women of all races love to decorate their bodies, but the motive for decoration differentiates the East from the West.

Our wives and mothers have been always active patriots. They do not shed tears unnecessarily, when they send off their husbands and sons to an almost certain death, because they do not wish to see their country defeated. Death is preferable to disgrace in their eyes. Many of them learn fencing and *jū jitsu*. The most famous among the many Japanese women who have won laurels on the field of battle, is the Empress Jingo, who flourished in pre-Buddhist Japan. We have revered her memory so much that innumerable artists from an early period of our history till now, have represented her in the act of handing over her infant son to the care of Také no uchi a rough, long bearded, old man, before she set sail for Korea.

It might interest you to know also, that our women, like those in some other Eastern countries, have exercised considerable influence on our political life. There were about nine Empresses on the throne of Japan before the Nara Period. They were as powerful as the Empress Lo and Wu of the Han and Tang dynasties of China. The Tokugawa Boudoir was so powerful that it made and unmade a good many premiers from 1853 to 1867 A. D.

Being more emotional, women are always capable of imparting culture to men. The Empress Suiko was highly instrumental in spreading the classical culture of Nara far and wide in the country. Later on, our women developed the native literature, when our men were engaged in the study of the Chinese classics. Two of the most famous novels in our literature are written by women. They are called 'Genji Monogatari' and 'Makura no Soshi,' Murasaki no Shikibu being the author of the first and Sei Shonagon of the second. In the Tokugawa period, our women were keeping up the light of Chinese culture in the country. We produced at this time, brilliant women like Hara Sahio, Cho Koran and poetesses like Chyo and Butani.

It is acknowledged all over the world that women are more religious than men, and our women were no exceptions to the rule. They brought over to Japan the religion of Sakya Muni from Korea where it had spread from the Chinese Empire. Three of them went to India, in order to study it at its fountain-head and came back to teach it in its pristine purity, to their people.

Our women are now engaged in educational, literary, scientific, hospital and other kinds of useful work. Although, they are doing it very creditably, we have no reason for being particularly thankful to our new educational methods imported from the West. It certainly gives breadth of mind but, unfortunately, it does not encourage depth of thought. Is broad superficiality preferable to intense spirituality?

Yours Sincerely,
J. OKAKURA.

INDIA AND THE NAVY.

BY MR. ROBERT W. BROCK,

Sub-Editor, Madras Times.

 quarter of a century ago the main problem of Indian defence was believed to be the protection of the Empire against what was regarded as the slow, but relentless, advance of our great neighbour of the North. The menace of Russian aggression still clouds the otherwise bright outlook of this country, but the greatest danger now resides elsewhere, namely, among the Powers who are aspiring to gain the supremacy of the sea. I should like to sketch, very briefly, some of the developments which have brought this transformation about.

As regards Russia two changes have occurred, each of which must materially affect her outlook and ambitions: (1) The rise of Japan, and the lesson she conveyed to Russia in the historic conflict of 1903. (2) The certainty that China will, within a time infinitesimal in the life of nations, occupy an equally strong position. Formerly Russia schemed to dominate the Continent. The rise of the two Asiatic Powers referred to has taught her that if the limits of Asiatic subjection have not yet been reached, at any rate we are within a short distance of them. The era of Russian expansion is, in a word, now practically over. The position in India has also changed, and the change has been, I think, in favour of Great Britain. The loyalty of India to Great Britain, and of Great Britain to the ideals which alone enable her to retain India's allegiance, are evident to all the world. Loyalty, of course, is not a substitute for military strength, but it is a very valuable supplement to it. Indian distrust of Russia constitutes a moral bulwark against aggression from that quarter of the strongest possible character. Is it not also time

that we equipped ourselves with clearer ideas of what Russia is anxious to do herself? The idea that Russia desires to possess India, and to be left alone in Asia face-to-face with a continent increasingly opposed to all her moral and political conceptions, seems to me to be a chimera which can now safely be dismissed as obsolete. There are many more parts of Asia which the Russian Bear would like to grasp in his fond, but fatal, embrace, besides those he now holds, but India is not, I believe, one of them. India would be of "no use" to Russia. India cannot be absorbed, and ultimately she will want self government; Russia therefore, is better off without her. As a further guarantee of Russian inoffensiveness, we have the Anglo-Russian *entente*, an alliance which we have made heavy sacrifices to maintain, and which is either a sham, in which case our foreign policy during the last five years is incapable of justification, or else should enable us to reduce our Indian military forces. I am going to argue, in a moment, that the danger to India comes no longer from the land but from the sea, no longer solely from Russia, but from the great naval Powers of the West. But I should like to emphasise that greater naval power is necessary even if Russia is the sole enemy. Command of the sea is, in fact, ultimately the one factor that could render a Russian occupation of India ineffective.

On land, then, our responsibilities have diminished. At sea, however, they have increased almost beyond belief. The growth of naval armaments has been the most striking feature in international politics during the last decade. It would be unwise not to take account of this. While the commerce and other interests of the Empire have grown, and not the least those of India, our means of defending them have not increased in the same ratio. Ten years ago the British fleet was estimated in relation to the next two greatest fleets; now it is estimated in regard to one. Twenty three years ago the naval expenditure,

of Germany was 2½ millions sterling. It is now £22,041,788. Why? Not for self-defence, because Germany is already the greatest military Power. The purpose of Germany's unprecedented naval development has been defined in her own Naval Act, 112, to build up "a fleet of such strength that even for the mightiest naval Power a war with her would involve such risks as to jeopardise its own supremacy." Formerly the British navy was dispersed throughout the Empire, defending every point of it. The German challenge has forced the Admiralty to concentrate our forces in the North Sea, there to be ready to meet the German fleet whenever it decides to strike. Now to assert that the trident has passed from our hands, as some of our Jeremiahs bewail, is, to use blunt language, sheer nonsense. On the other hand, it has been shown that Great Britain can no longer preserve the Empire's supremacy on the seas, unaided. Sea power is now, and will be to an increasing extent an Imperial affair, in which each part of the Empire will be asked to assist in proportion to its interests and resources. That is the position the statesmen and people of India are invited to consider, (1) the naval crisis in which the Empire finds itself (2) India's relation to it.

Now, I am prepared to be told that India is already contributing to the defence of the Empire and I am anxious to say that I quite acknowledge that. In fact, India was earlier in the field than the other overseas Dominions. She was providing for her own defence on land when the white colonies were still dependent for the preservation of their integrity on the men and resources of the mother country. But all that has changed. Since they realised what the position was, the Dominions have done splendidly. Australia, for instance, is enforcing universal military service; so is New Zealand. Australia is also building a navy, at an ultimate cost of something like £80,000,000. For a people numbering only five millions, this is really generous. Canada's intentions are well known, and only

a few days ago we heard that South Africa was also to support the navy. Even the Crown Colonies are coming to the old country's aid, as witness Malaysia's offer of a Dreadnought. India, in fact, is now the only considerable part of the Empire which is not supporting the navy. We ought to consider, I think, whether such a position accords with our stake and responsibilities in the Empire.

A comparison of the statistics will show that, while India's trade ranks second in the Empire only to that of Great Britain, her expenditure on defence is now smaller per head than that of any other part of the King's dominions. Thus, while Great Britain contributes £1-12-3 per head, Canada 6s 5d, Australia £1, South Africa 2s. 9d, and New Zealand 5s 9d, India spends only 1s. 3d. per head. That, of course, is excusable on account of her poverty. Low as her contribution is, and rapidly as her resources are expanding, I believe there is no desire in authoritative quarters to ask her to increase it by a single anna. Those who have studied the subject recognise that for the next half century perhaps the best service India can render to the Empire will be to develop her internal resources, and devote herself to the moral, mental, and material elevation of her people. On the other hand, in view of the competition the Empire has to face, it would not be unfair, I think, to ask India to keep her contribution at its present level. The point at issue is not whether India's outlay on defence is adequate in proportion to her resources and responsibilities, but whether the expenditure is rightly distributed; and if the Nicholson Commission report that, in spite of our *entente* with Russia, no diminution of our military forces is advisable, then the question of a naval contribution must, I think, be dropped. But if a saving is possible on the army, the money should, I think, be devoted to the service in which expansion is really necessary, the navy.

India aspires to self-government. The first preliminary, and only guarantee, of self-government is self-defence. As the privileges of Indians grow, so do their responsibilities. We want, not only to make India united and prosperous, we want her to maintain and improve her position in the Empire. If ever an opportunity offered itself of gaining for India a place in the respect and affections of the Empire, surely this is it. The Durbar was, so far as India was concerned, merely an occasion for words, valuable no doubt, as far as they went, but still, only words. The naval difficulties of Great Britain provide us with the opportunity of showing that Indian loyalty is not only a matter of words, but of deeds. I have only been able, in this note, to touch on the fringe of the subject. It is now open to those who represent Indian opinion to put their side of the case. The function of the English man ends with drawing attention to the matter. If action comes it should come from the population permanently resident here and it should also come, not under pressure, but spontaneously. If Indians think that the country is not in a position to offer a naval contribution, no one, I am sure, will try to persuade them to act in opposition to their convictions. Nevertheless, I am convinced that if India desires to place herself in complete harmony with the rest of the Empire, there is no surer method of doing so than by the procedure I have indicated.

P. S. Since the above observations were written a statement has been circulated to the effect that the Ruling Chiefs of India have been, or are, conferring with a view to building an Indian naval squadron. If the statement is true, we are on the threshold of, what I venture to assert is, the most important step yet taken to bind this country permanently to the British Empire. A naval contribution, made at their own request, would show that Indians are now the ruling factors in their own defence; that the instinct of

self-defence, which comes to all nations, has come to them; and that in future India may be regarded as an asset, and not as a liability, in the defence of the Empire. One can easily conceive that the ultimate outcome of such a step would be far reaching. The King-Emperor has given us the watchword "Hope". Good. But before there can be Hope there must be Trust. The maintenance of a British Army here, though urgently needed at home, is at bottom, due not to any denial of the fighting qualities of the Indian race, but to a lack of trust. Memories of old struggles still linger and in spite of many signs proving the growth of a new and more loyal spirit the old suspicions persist. The remedy is in India's own hands and it is to perform some act of positive patriotism which, while confirming and embodying what I may call the Durbar spirit, will also give that wonderful proof of Indian loyalty a permanent and material form, palpable equally to the Empire and to the world at large. In such circumstances the ultimate evolution of India as an autonomous community under the eyes of the British Crown, a free nation among equals, would be assured.

Repentance.

[A Story Descriptive of Life in the interior of Ceylon.]

BY

THE HON. MR. T. B. L. MOONEMALLE.

(Member, Legislative Council, Ceylon.)

PART I.

I AM sitting at the stile, leading to the village green and my thoughts are in a tumult. A great depression is weighing me down, I know not where to turn. The reason for this is plain, for I am what people commonly call a "jail bird." Pardoned I may have been, nevertheless men will call me that to the end of my time. The events

of the last few weeks come crowding into my brain, and I can hardly recall them, in the order in which they took place, without an effort.

Oh! that I could forget all and begin life again with a clean record! But this is impossible! You may say that my fault was due to indiscretion or to want of thought, but the facts remain.

I shall here relate all these facts which led up to my arrest and conviction, and as the narrative develops, provide the correct setting for the picture I am about to draw. The reader will thus be able to judge for himself how far I was responsible.

The scene before me is a peaceful one, and beautiful withal. I shall not exchange it for anything the world can give, for it is intimately connected with my early childhood and later emergence into the joyous time of youth.

The sun is setting beyond the blue hills in the distance, and painting the landscape with rainbow hues, vivid and ever changing. Before me is the village green, refreshed into a bright emerald by the recent showers. In spite of the inspiring and glorious panorama, in spite of the memories of a happy childhood, I am sad, and the breezes wafted from a thousand directions whisper in my ear the awful message, "youth, thou art discredited in thy community, a nameless wanderer shalt thou be."

I have just reached the age of twenty three. The pulse beats strong, and the heart throbs buoyantly but the future seems dark and obscured by a heavy curtain as of night.

I am of the house and lineage of the *lélams* or scribes. That is the tradition. In British times my ancestors took service as the minor headmen of the village. My father served as such for a long period, but died when I was a youth, leaving me and an infant brother in charge of his widowed sister, who was ever faithful to her trust and brought us up according to her lights.

I grew up in much the same manner as the average village child. I attended the village school, learning my letters and figures; and although my career there was not brilliant, I was able to write a legible hand, and manage an ordinary account with facility. Naturally, my great ambition was to succeed my father as headman of the village when a suitable opportunity occurred. As very often happens in the like circumstances, the headman in office was the one person who was opposed to my scheme. I had long since realized that he was my enemy, but I had inherited large possessions and was a man of wealth according to village notions. It did not seem to me at all necessary to cultivate his friendship. So long as I paid my taxes, I thought, and conducted myself with that degree of propriety which prevailed amongst other men in the village, I was safe. There were many youths of my own age in the community, whom I generally met in the ordinary occupations of life. When ploughing, sowing or reaping, there was much rivalry between us. There were, however, intervals of time which were spent in absolute idleness. These periods of idleness were not good for us as I afterwards learnt to my cost. Gradually, without knowing it, I came to be associated with a set of young men who when they drank, drank deeply, and when they gambled did so for heavy stakes. I was fairly cautious all the time, but my sensibilities became blunted imperceptibly, and the prickings of conscience began to be scarcely heeded.

I remember one recent harvest when the work of gathering and storing the crop was heavy indeed. My aunt, who minded the home duties, was ill and too feeble to assist me. I was forced to summon several of my young friends, of the set I have described, to my aid. When all the work was done I felt called upon to entertain them, according to the customs of my people. The entertainment took the shape of an open air break-

fast, and it is needless to say that we enjoyed ourselves immensely. But alas! the demon of drink crept in, and nearly marred our enjoyment with a gruesome ending.

The headman arrived on the scene and was about to march us to the nearest lock up, when some one suggested a "small present" which, when delivered, acted like a charm, and we youngsters were let off with a warning to go to our homes and keep still for the rest of the day.

Had I taken this lesson to heart, my story would have been vastly different.

The check I had received, however, set my thoughts drifting in another direction. After this incident my aunt told me that if like a reasonable man I had taken to myself a wife, she would, without much difficulty, have summoned a few of her friends, and with their help, harvested the crop. I was much inclined to agree with her, and wondered why I had not taken this necessary step earlier.

I had a playmate who used to frequent the village green and gambol with the rest of us when we were children. She had long since grown up, and was at this time, living a somewhat secluded life, as is the custom with our people; fulfilling however her household duties, with care and efficiency. She was the beauty of the village, and many a young man's heart used to beat with a painful throbbing at the sight of her, but all to no purpose. At one end of the green, in a spot secluded by the overhanging branches of a clump of graceful bamboos, was the village well. Thither the maidens resorted in the cool of the evening for the water needed at their homes.

I was standing by the stile one day, doing nothing in particular, when my attention was arrested by the laughter of a bevy of girls at the well. I stealthily crept along the path leading to the grove of bamboos till I reached it unseen by the gay crowd. My old playmate was evilently relating a story which to me was inaudible. Sud-

denly there was a shriek and a chorus of lamentation. Rin menika, for that was the name of my erstwhile playmate, had in the course of her narrative, dropt into the well the string of coral which encircled her beautiful neck. I noticed the absence of the beads at once. I kept still and waited. The girls did all they could to regain possession of the beads, but without success. They seemed to be greatly agitated by the incident, but entirely powerless to act. Well knowing the natural timidity of our women folk, I was sure that the girls would keep the loss to themselves rather than incur the displeasure of the elders of the village by recounting the tale. With many backward glances they tardily repaired to the settlement, carrying the pots of water on their heads. As soon as the last of them had disappeared, I ran to my house, and fetched a bill hook with which I quickly cut down the longest bamboo in the clump. Fixing it as firmly as I could to the bottom of the well, and sterdying its upper end against the stone wall which encircled the well, I carefully descended using the knots of the bamboo as steps for my feet. A sudden holding of the breath, a dive below, and I had secured the coveted prize! I placed the string of coral in my waist and sauntered leisurely homewards. As I was going along an inspiration got hold of me, and I decided to write a sonnet descriptive of my attachment to this the fairest of women, and the restoration by her true knight of the valued jewel which adorned her comely person. No sooner was the thought conceived than it was accomplished, the verses were inscribed in a strip of *ola* with the aid of the style, and the writing smeared over with a mixture of lamp-black and perfumed oil, to secure its clearness. I placed the string of coral and the writing in a neatly tied up parcel, and handed it to my brother, asking him to repair to the house of Rin-menika and deliver it personally to her. The innocent lad readily assented and set out on his

errand. This he faithfully executed, but could tell me nothing as to the reception he had been accorded. Several days of weariness and impatience had passed, and I was still waiting. About five days after, I was again at the stile listless and unhappy, when I saw a little white flag waving from the direction of the grove of bamboos. I ran up to the signal, to find the lovely girl standing with eyes averted, hiding within the recesses of the thick foliage.

"Fair one," said I, "dost want me?" "Comrade," she replied, "I have watched for an opportunity of meeting you, but some task has always prevented me. Even now there are many duties awaiting me and I must run back as soon as I can. I thank you sincerely for what you have done. Your generosity is only excelled by the gallantry you have displayed. A maiden may not tell what she feels, but time presses and I can only whisper that I am your servant, to do as you will."

"My adored one," I rejoined, "you are my queen, it is I that shall be your slave." Heartily the lady replied, "It is not right there should be speech between us about things of which we have no experience, but go boldly to my parents, press your suit before them and when that is done a maiden's duty will be faithfully performed."

With these words she suddenly disappeared, leaving me a prey to the most conflicting emotions. I could see however, that the maiden was correct, and contented myself with the reflection that I had need to be thankful to the gods for the assurance that my affection was returned.

My patience was sorely tried during the next few days. But the preliminary negotiations were in due time over and the day of the wedding was fixed. It was to take place after the fields were sown. Three months to wait, and yet to wait was all that was demanded of me.

As I was making my preparations for the coming event, one of the young men who belonged to the set I have already described, came to the house and asked whether it was true I was soon to be married.

I pleaded guilty to the soft impeachment with a needless show of reluctance.

Producing a bundle from his waist, my friend displayed before my astonished gaze, the loveliest string of corals I had ever set eyes on. I was so taken up with the beads that I purchased them on the spot, intending to present them to my bride when I escorted her home.

Next day I was lying in the **pala* reading an old book, when at noon the headman came, and began speaking to me in the blandest tones. Suspecting nothing I spread a mat for him on the *pala* and we sat down together. Our conversation lasted for a few minutes, and as I was preparing to offer him the customary chew of betel, he seized me by the wrists and clapped a pair of hand cuffs on them. No explanation was given me of this outrageous conduct, and I was told to wait till I was produced in Court to hear the charge against me. I was taken to the headman's house, where I met three of my boon companions in stocks, looking very unhappy, and I was soon compelled to join them. I spent the whole night in this uncomfortable situation, and try as I would to make my unfortunate fellow prisoners speak, not a word could I get from them. Next day we were taken to the court and I found to my amazement that I was charged with highway robbery along with the other three. The headman entered the witness box and disclosed a gruesome tale. He said that two Moorish merchants came to him several days before, and stated they were making a tour, through the villages, trading as they journeyed along. One evening they were passing the *ambalam** in our village, when they saw a party of young men

*A Sinhalese term for a narrow verandah used for sleeping on.

playing, as they thought a friendly game of cards. The party at once rushed out of the *ambalam* and robbed them of all their merchandise, consisting of coral and other articles, with all the cash they had in their possession. The description given by the traders helped him to arrest the first three accused with the stolen articles. The fourth accused,—meaning me—was at first arrested on suspicion, but was duly identified as one of the party, by the traders. He asked for a search-warrant in order to ascertain whether any of the articles still missing could be discovered in my possession. He next produced the stolen property. In the lot I observed several strings of coral exactly like the one I had purchased from the first accused.

The search-warrant was granted, and I was present when the string of coral was found in the old wooden box at home. The case came on for trial in due course and was proved to the hilt. The old experienced lawyer, who appeared for me shook his head when he took down the instructions for my defence, and sadly told me, that although he had no doubt whatever regarding my innocence, my ultimate conviction was inevitable. I myself had a strong presentiment that nothing could save me. There was first the fact that the traders were robbed. When they were confronted with the alleged thieves they identified all. Then came the discovery of the beads in my possession, soon after the robbery. My protestations of innocence availed nothing. Besides, it was absurd to expect the Court to differentiate between me and the others when the evidence was the same against all.

You may ask how the traders came to identify me as one of the gang. It was in this wise. The headman, as I have already said was no friend of mine. He had no doubt heard that I had purchased one set of coral. He set to work on this basis eliminating all facts which tended to prove my innocence.

When I had been arrested and put in stocks with the rest, the headman beckoned to the traders and asked them—putting the question in a leading form—whether I was not one of the gang. Both traders readily admitted this, believing that their statement was true. The headman immediately made a note of the admission in his diary, and the mischief was done.

We were all convicted and received a sentence of twelve months each.

Just as the sentence was pronounced, I heard a piercing shriek and I saw my love being led away by her mother fainting.

My heart sank within me and I bade a silent farewell to the hopes I had cherished.

As I was being led away, the old lawyer looked at me with tearful eyes and told me not to despair.

There was great excitement one day in the prison. We heard that the Supreme Court had closed its sittings and that there was to be what is known as a "jul delivery". We were marshalled in the parade ground within the jail walls in sections, each section being in charge of a warder. A venerable looking old gentleman, attended by several officials approached us, carrying in his hand a petition. He read out my name and ordered me to step forward. My three companions were also separated from the crowd and the whole group marched into the office close by. I was first closely examined, and I stated without reserve all the details that were known to me. My three companions stolidly denied that I had been at the *ambalam* on the day of the robbery, or that I had taken any part in it. The Supreme Court Judge—for that was the official who conducted the inquiry—smiled benignantly on me as he dismissed us, stating that he would report the whole matter to the Raj in Colombo.

I noticed that after this event I was not given any of the usual tasks. About a fortnight after, the jailor showed me a sealed letter which he said

had come from the Raj. I had been pardoned and was free to go home. Here I am sitting at the stile, thinking and thinking, but wholly incapable of taking up the threads of my life again.

PART II

My love came boldly to me at the stile, a few days after my return. She fell at my feet and began to cry. I held her hand and could say nothing. After her emotion had abated, the brave girl began to speak hesitatingly. "Lord of my heart," she said, "to live in this village under existing conditions is impossible. Even my parents have turned against me because I would not marry another. Can I give my hand where my heart goes not? When my lord was taken to prison I thought the end of the world had come! My mother accompanied me to the court against her wishes but I would go with or without her. The kind old lawyer who defended you sent his clerk to me, after my lord had been removed. He asked why it was I had shrieked when sentence was pronounced. I would not reply. He pressed me to speak, but modesty prevented me. 'Young woman,' he continued, 'much depends upon your reply, for there is yet something we might do for my unfortunate client.' Hope stirred within me and on its dictates I replied 'Excellence, it is not right that a maiden should speak on matters which only her elders have the privilege of discussing. I am willing however to confide in you. I was betrothed to your client and should have married him in a short while but for the animosity of the headman.' 'Has he no relatives who can act for him?' I knew his father well and did all I could for the youth as an inadequate return for the services the old man had faithfully rendered me in protecting my interests in your village. Is there nobody who can sign a petition for pardon?' 'My lord,' I said, 'I shall go back to the village and summon to your office the old aunt who has so far protected the youth.'

"Do so," was the reply, "and come up with her a fortnight from to-day."

Lord of my heart, I carried out the lawyer's instructions. When I reached the town, the session of the Supreme Court was in full swing. A petition for your pardon, fully stating the facts was ready in the lawyer's office. This was signed by your aunt and presented to the presiding Judge. The result my lord knows.

I followed the recital with a beating heart, and took my old playmate in my arms, kissing the thanks which I could not express.

"Lord," said she, "there is still much to be done! We must not allow things to rest here. Although I say it as should not, we must be married—this with the blushes thick upon her fair face.

"I quite agree, dear lass," I rejoined, "but what about the consent of your parents, and what will the world say to your marrying a degraded man?" "I care a rap for the consent of my parents or the opinion of the world!" she exclaimingly replied.

The maid would have it so, and we were quietly married.

The first thing we did after that was to visit the old lawyer with as gorgeous a present as we village folk could afford, and thank him for the unestimable services he had rendered us. He was glad to see us united and happy. Through his instrumentality a full investigation into the circumstances of my case was secured. The animosity of the headman was proved beyond cavil, and he was summarily dismissed.

I am now the headman of the village and Ran menika, the mother of my children, is the Queen of my home and the Lady Beautiful of the settlement.

The one regret which troubles me sometimes is, that I should have been such a fool as to be incapable of discriminating between a desirable friend and his opposite.

Current Events.

BY RAJDUARI.

THESE paragraphs are being indited on the eve of the ambassadors of the Great Powers proceeding to London for the Conference which is expected to bring peace between the Balkan Allies and Turkey. What may be the final outcome is on the knees of the gods. But judging from all signs and the prevailing utterances in the European Press, it seems that there is every probability of a satisfactory peace—such as shall satisfy on the one hand the *amour propre* of the Ottoman and on the other the aspirations of the Allies who have borne the brunt and the heat of the war and established their claim for holding fast by the territories they have respectively occupied during the course of the War. It is alleged that the Greeks alone are sulking. This sulking is generally condemned by the Continental and British Press. But it is to be presumed that Greece will come into a line with her colleagues and prove herself reasonable besides. There is also the apprehension of a difference as to the occupation of Salonica between the Serbian and the Austrian. It is a hard nut to crack, seeing that the interests of the two are in direct conflict. That the Serbians should seek for a post is quite natural and intelligible. Every land-locked Power yearns to reach the sea in order to develop its trade and commerce. On the other hand, it is believed that the "open door" policy of the Turk hitherto specially in reference to Salonica, may, in case the Serbian is able to secure it as a fruit of his own unaided exertions and sacrifices, lead to the shutting out of that post against all others, Austria included. It is a ticklish problem which, it is to be devoutly hoped, will be solved in a judicious and judicial spirit by the London Conference. Otherwise, the apprehension is that a conflict on this point may blaze forth into a Continental war of colossal magnitude. Modern wars, at least of the last hundred years, have had more or less their origin in economic or politico-economic causes, real or pretended. And it seems that the wars of the twentieth century (which Heaven forbid) are most likely to originate in economic causes pure and simple rather than any other. Everywhere the world resounds with the incessant cry of "open door" or "closed door," here and there. Then, again, we hear continuously of "zones

of influence," and "spheres of interest." Formerly wars "disguised as commerce came." So sung the poet. Now-a-days wars are *openly* declared to obtain a foothold for purposes of commerce, because the old hypocrisy has come to be thoroughly namasked.

Again, there is the difficult and tangled problem of Albania with its mixed population of Christians, Mahomedans, Slavs, and so on, not to say aught of the primitive fierceness which still characterises the people who, save in the fifteenth century, have not been known to have a settled state or a homogeneous nationality. The autonomy of Albania is undoubtedly in the air but how it is to be established on the line of the least resistance is a tough task which will absorb many anxious hours of the coming peace-makers and tax their diplomatic sagacity to the fullest.

Lastly, there is the virile state of Romania which all through the sanguinary belligerency has stood aloof but is no doubt desirous of rectifying its frontier so as to be free on one side from the Ottoman and on the other from the fierce Bulgarian. It is superfluous to observe that all love is lost between the Bulgar and the Romanian. The latter's demands, so far as they seem to be limned in the same official or friendly organs of opinion, are on the whole moderate, and there is every likelihood of a near realisation of them. The state is a sagacious one but free and strong and capable of carrying on hostilities single-handed if need be. It is better situated every way than the Allied Balkan States.

The next fortnight or three weeks will be weeks of the greatest curiosity, if not anxiety, for the great Continental Powers. The ambassadors are luckily to meet in the capital of the greatest country in the world which has no axe of its own to grind and which, besides, has been benevolently neutral, neither inclining to the one side nor the other. It was a happy thought which suggested London as the place for finally settling the terms of "peace with honour" all round. Let us hope it will be *solid and undisturbed* peace with honour more than the bombastic one which Benjamin Disraeli brought from Berlin some thirty-four years ago midst "a blaze of triumph." The Allies have cut the Gordian knot of the Near Eastern question which has now and again loomed large during the last hundred years with a variety of menacing portents and with them great wars at intervals since the historical Navarino. Europe is bound to breathe freely if what has been called "the eternal question" of the East is solved to the

but working at high pressure. So much so that the percentage of the unemployed has dwindled down to next to nothing. That is indeed a phenomenal economic condition. But the question is how long will it last. The time must inevitably come when overproduction will lead to a period of equally "phenomenal" depression. India should profit by the present situation.

CONTINENTAL POLITICS.

Apart from the situation created by the armistice, it may be said that the Continent has presented a tolerably quiescent attitude. How long it may last is problematical. The Great States are no doubt armed to the teeth. Their Standing Armies are undergoing the supposed annual exercise of mobilisation which under certain contingencies may mean something exceedingly ominous. There is a seething volcano underneath the quiet surface. A match may kindle it, and the dreaded eruption, with its unlimited quantity of fire and brimstone, may convulse Europe and the world. Austria and Italy are at a game of cross purpose, while Russia and Germany are on-lookers, but with a keen eye to their respective specific interests. The map of Europe must undergo a change with the eruption now so greatly dreaded. Meanwhile the naval strength of the maritime States is being steadily increased which means more and more naval expenditure of an uneconomical character. So long, however, as international rivalries and jealousies continue,—and it is problematical whether they will ever end—this kind of expenditure is bound to go on at the expense of each nation.

England at present is in exultation at the patriotism which has impelled Canada, under the Protective Tariff protagonist and Premier, Mr. Borden, to present 3 first class Dreadnoughts at its own cost but at the cost of the British Treasury for maintenance. Australia applauds the gift but other Colonies are looking somewhat askance at this coruscation of the Canadians. Whether the Empire will be more firmly knit on *this account* and whether the Imperial Defence will be better for the gift, are questions which time alone can solve. There are Colonies which seem to think that self-defence is better than such a gift to the Mother Country which is wealthy enough to build any number of these titanic war vessels. The British Empire will, they opine, be better defended when each self contained Colony can defy external aggression on its own shores.

Italy, Austria and Russia are now foremost in their activity for building up a strong naval fleet

for offensive and defensive purposes. Italy is glorying in a fat surplus while its War Minister has boasted of the late war expenditure in Tripoli having been met without fresh burdens on the taxpayers! That oracular pronouncement, however, must be received with a large reserve. Every State is accustomed to arithmetical jugglery in presenting its finances. The continental Powers are great adepts at concealing the true conditions of their finance and presenting a rosy picture which under the investigation of the skilful and independent financial physician proves to be the very reverse. It should not surprise us were one such soon to contradict the boasting War Minister at Rome.

The Mailed Fist is unusually quiet at this juncture! Can it be that it is his quiescence before the coming Continental storm so ominously apprehended? Any how it is a hopeful sign—this absence of garrulous activity on the part of the Emperor and the customary indiscretions. The aged monarch who still presides over the destiny of Austria and Hungary has seen many a political vicissitude during his long reign but it is doubtful whether he has known such times as the present. Though Hungary is torn into factions and though wild and even Hooliganlike scenes are enacted in the Hungarian parliament, the veteran at Vienna is able by sheer force of his strong character and sagacious experiment to keep up the Dual monarchy in a state of tolerable equanimity. At present he is passing through most anxious times.

Portugal is quiet and so is Spain, though the dastardly assassination of one of Spain's most cautious and reforming statesman of recent times is exceedingly lamentable. King Alfonso has lost in the person of Senor Canalejas a trusted and able Premier the like of whom may not be seen for many a day. It bespeaks volumes to his royal credit and appreciation of the assassinated Prime Minister that he courageously headed the funeral defying the anarchist and mourned his loss in public by kneeling down and praying for the worthy soul departed. Such an act of appreciation kindles corresponding sympathy in the heart of a grateful people, and the one feature which has relieved the dismal condition of Spanish politics during the last few years is the conduct and action, the courage and public appreciation of one who has fallen as martyr to his duty. The name of Senor Canalejas will remain memorable in Spanish annals for many a generation to come as a genuine patriot and benefactor of the people—*Sans peur et sans reproche*,

22. If the system of recruiting military officers in India for posts in the Indian Civil Service cadre has been stopped or has never existed in your Province would you advise its re-introduction or introduction, as the case may be, and if the system should be introduced or is introduced, to what extent, in your opinion, should it be adopted?

23. Do you consider that such a system should be restricted to the recruitment of military officers, or extended to the recruitment of selected officers from other Indian services?

24. What is your opinion of the system by which certain posts, ordinarily held by members of the Indian Civil Service, are declared to be posts (ordinarily termed listed posts) to which members of the Provincial Civil Service can properly be appointed?

25. Are you satisfied with the present rule which prescribes that natives of India, other than members of the Provincial Civil Service or Statutory Civilians, may be appointed to one quarter of the listed posts?

26. Are you satisfied with the system by which most of the inferior listed posts are merged in the Provincial Civil Service?

27. Is the class of posts listed suitable? If not, in what directions would you suggest any changes, and why?

28. Please add such remarks as you may desire to offer on any points relating to the system of recruitment for Indian Civil Service posts which are not covered by your answers to the foregoing questions.

29. Do you consider that candidates recruited for the Indian Civil Service by open competitive examination should undergo a period of probation before being admitted to the Service?

30. If so, how long, in your opinion, should this period be, and what course of study should be prescribed for the probationers?

31. Do you consider that any differentiation is necessary between the course of study for probationers who are Natives of India and the course prescribed for other natural-born subjects of His Majesty? If so, please state the special arrangements that you recommend.

32. Do you consider that the probationers' course of instruction could best be spent in England or in India? In your answer equally applicable to the case of Natives of India and of other natural-born subjects of His Majesty?

33. Do you think it desirable to start, at some suitable place in India, a College for the training of probationers of the Indian Civil Service, and possibly of other Indian Services recruited in England?

34. Do you think it desirable that each Provincial Government should arrange for the training of probationers by suitable courses of instruction for the whole or portions of the first two years of Service at some suitable center?

35. Are you satisfied with the present arrangements for the training of junior officers of the Indian Civil Service after they have taken up their appointments in India? If not, what change should, in your opinion, be introduced?

36. Do you consider that there has been any deterioration in the knowledge of the Indian languages possessed by members of the Indian Civil Service? If so, what are the causes? Are you satisfied that European members of the Indian Civil Service attain an adequate proficiency in the study of the Indian languages, and, if not, how could this lack be remedied?

37. Please give your views as to what steps (if any) are necessary to improve the proficiency in the knowledge of law of members of the Indian Civil Service, distinguishing between recommendations applicable to all officers and to officers selected for the Judicial Branch.

38. Do you recommend any special course of study in law in India for officers selected for the Judicial Branch?

39. Do you recommend any special training in subordinate judicial posts in India for officers selected for the Judicial Branch? If so, please give details.

40. Is any differentiation desirable in a system of training after appointment in India between members of the Indian Civil Service who are Natives of India and other natural-born subjects of His Majesty? If so, please state the special arrangements that you recommend.

41. If you have recommended the introduction of any scheme of direct recruitment in India for Natives of India, whether in lieu of, or supplementary to, the system of recruitment in England, please state what system of probation and training you recommend for officers so recruited.

42. Is any differentiation necessary in regard to the probation and training of members of the Indian Civil Service who are Natives of India as between persons of unmixed Indian descent, of mixed European and Indian descent, and of unmixed European descent? If so, please state your proposals.

43. Please add such remarks as you may desire to offer on any points relating to the probation and training of members of the Indian Civil Service which are not covered by your answers to the foregoing questions.

44. Do you consider that the numbers of officers authorised for the various grades of the Indian Civil Service are satisfactory? If not, please state your views.

45. Do you consider that the exchange compensation allowance introduced in 1893, eligibility for which depends on nationality or domicile, should be abolished, and if so, under what conditions? Should such abolition apply to officers already employed or to be restricted to future entrance?

46. If abolition is recommended with compensation in the form of increased salaries, what is your opinion regarding the grant of a similar increase of salary to those members of the service who now draw no exchange compensation allowance?

47. Turning now to the case of the Statutory Civilians and officers of the Provincial Civil Services holding listed posts, do you approve of the arrangement by which they draw salary approximately at the rate of two thirds of the pay drawn in the same posts by members of the Indian Civil Service? If not, what rates do you suggest for the various grades of the service?

48. Have you any proposals to make in regard to the Leave Rules applicable to members of the Indian Civil Service?

49. Have you any proposals to make in regard to the Leave Rules applicable to Statutory Civilians, and to members of the Provincial Civil Services holding listed posts? In particular, do you consider that separate sets of Rules for such officers and for officers of the Indian Civil Service are desirable?

50. Please add such other remarks as you may desire to offer on any point relating to the conditions of service, salary, leave, and pension in the Indian Civil Service.

efficient drainage and conveyance, rat proof and mosquito proof houses in which overcrowding is not allowed, up-to-date markets, slaughter houses, bathing places, open spaces, recreation grounds, and an ample sanitary staff under expert supervision."

TRAVELLING DISPENSARIES

"That experience in Upper India has demonstrated that under proper supervision and in suitable localities travelling dispensaries of a simple kind, apart from the question of medical relief, are measures of utility as instruments for the education of the people and as the means of reconciling them to modern methods of disease prevention."

"That the attention of the controlling authorities of the Local Governments and the Indian Research Fund be earnestly invited to the advisability of an exhaustive inquiry into the following matters: (a) The difficulties of salt removal from river water-supplies. (b) The most suitable methods of water analysis and the possibility of fixing definite bacteriological standards for India. (c) The plans to be adopted for conveying samples of water to and from distant laboratories."

CHOLERA.

"That there is strong evidence to show that in India in addition to contaminated water the four following factors are of great importance in the spread of this disease:—(a) Convalescents discharged while still infective. (b) Healthy persons who have been in contact with cholera cases and have acquired the infection without showing any signs of the disease but who are excreting cholera vibrios in their stools. (c) Flies. (d) The personal habits of the people."

PLAGUE

"That encouraging advance has been made in the knowledge of the etiology and epidemiology of plague and that research should be continued on the present general lines. That the results of recent enquiries point to the special importance of action in the following directions:—

"(a) It is advisable to bring forcibly to the notice of the public the importance of these as an essential factor in the causation of plague and that plague preventive measures which aim at controlling human beings alone are insufficient and that it is more important to carry out those measures of permanent utility, which tend to lessen the rat infestation of the house such as house tidiness and improved scavenging, the prohibition of the housing of live-stock within the precincts of human dwellings and the provision of ample light and air in every room in the house.

"(b) Rats infected with plague are more responsible for the carriage of infection from one place to another than persons suffering from the disease, therefore grain stores and grain markets where these animals abound play a large part in the spread of plague so that the protection of grain in grain dealers' shops, the construction of rat proof grain godowns and where possible their erection at some distance from human habitations are useful plague preventive measures. (c) Localities infected late in one plague season are important sites of early epidemics in the next and thus potential foci of widespread infection. Special attention therefore should be directed to the definite location of such localities and the energies of the plague preventive

staffs instead of being relaxed should be concentrated on them during the quiescent period awaiting the natural forces which at this season tend to obliterate infection by well-organised schemes of rat destruction, inoculation and evacuation and general sanitation measures should also be taken to prevent as far as possible the transference of infection to other places from these infected foci.

TUBERCULOSIS

That statistics appear to show that this disease is rapidly increasing in India especially in urban areas, but it is doubtful whether the increase is a real one or apparent only, and due to such causes as more accurate diagnosis and registration. In view of the importance of this question a full and thorough inquiry seems desirable. That following measures are recommended to check further spread of this disease:—

"(a) The improvement of general sanitation and the opening up of congested areas, the provision of ample light and air in all inhabited rooms both in private dwelling houses and in schools. (b) The formation of anti tuberculosis societies. (c) The establishment of tuberculosis dispensaries. (d) Efficient control of milk supplies. (e) Compulsory notification of the disease at any rate in the larger towns.

"That this disease is a cause of much sickness and mortality throughout India generally and that while clinically it presents a clear and definite picture, much uncertainty and doubt still exist as to the causation of its different varieties. Seeing that on our knowledge of this depend both treatment and prevention, it appears desirable that the whole subject should be carefully and thoroughly investigated *ab initio*.

The Indians of South Africa

Indians within the Empire! How they are Treated.

BY H. S. L. POOLAK, Editor, *Indian Opinion*.

This book is the first extended and authoritative description of the Indian Colonists of South Africa, the treatment accorded to them by their European fellow-colonists, and their many grievances. The book is devoted to a detailed examination of the disabilities of Indians in Natal, the Transvaal, the Orange River Colony, the Cape Colony, Southern Rhodesia, and the Portuguese Province of Mozambique. To these are added a number of valuable appendices.

Price Re. 1. To Subscribers of the "Review," As. 12.

M. K. GANDHI A GREAT INDIAN

This Sketch describes the early days of Mr. M. K. Gandhi's life, his mission and work in South Africa, his character, his struggles, and his hopes. A perusal of this Sketch, together with the selected speeches and addresses that are appended, gives a peculiar insight into the springs of action that have impelled this remarkable and saintly man to surrender every material thing in life for the sake of an ideal that he ever essays to realise, and will be a source of inspiration to those who understand that statesmanship, moderation, and selflessness are the greatest qualities of a patriot. (With a portrait of Mr. Gandhi.)

HON. MR. GOKHALE.

SIR M. M. BHOWMUGGREE.

Mr. Gokhale and the Indians of South Africa.

The Hon. Mr. C. K. Gokhale, O.I.E., has had a splendid reception in South Africa during his four weeks' tour in that colony. Europeans and Indians alike welcomed him with hearty enthusiasm. The European residents received him with a warmth of feeling and courtesy scarcely expected, and the Government at Pretoria was magnanimous in its friendly attitude. In order to facilitate his convenience special trains were arranged where necessary and a representative of the Immigration Department was deputed to accompany him throughout the journey. It is very significant to notice that at the Banquet given in his honour at Kimberley, Europeans and Indians alike sat at the same table. This is unique in the annals of Diamond Fields. The Indians, of course, were jubilant. Of the scope of Mr. Gokhale's mission, his experiences and impressions and of the results of his tour, the following luminous address he delivered at the recent Town Hall meeting (in Bombay, will give an idea. [Ed. J. R.]

MR. CHAIRMAN, LADIES AND GENTLEMEN,—I cannot tell you how glad I am to be back again in India and my joy is further intensified by the kind and cordial greetings which this great gathering has extended to me and the generous terms in which you, Sir, have spoken of my work in South Africa. Your warm welcome joined to the undoubted satisfaction with which our countrymen in South Africa have regarded the visit, is to me ample reward for such strain as the work imposed on me while it lasted. You probably know, what I have publicly stated more than once, that my visit was undertaken in response to an earnest invitation repeatedly pressed on me by our great countryman there, Mr. Gandhi. When I first made up my mind, however, to pay the visit, my idea was to go about the country as quietly as possible to visit all important Indian centres, to collect such facts as I could concerning the treatment to which our countrymen were subjected there and on my return to India to lay those facts before the Government and the people of this country in the hope of stimulating thereby greater exertions on this side in support of the Indian cause in South Africa. And it was not till I actually landed at Cape Town and saw the elaborate programme which had been drawn up for me that I realised what work was expected of me by my countrymen there. Again it was no part of my first plan to seek to approach the authorities in South Africa directly with a statement of Indian grievances. That suggestion was first made to me by the authorities in London. I think I am committing no indiscretion when I state that it was Lord Crewe and Mr. Harcourt who strongly suggested to me the extreme desirability of my seeking an opportunity to discuss the Indian question personally with the Ministers in South Africa. My answer to them at that time, however, was of a tentative nature. I said that I should be glad to act on the suggestion if I found it possible to do so, consistently with self respect,

If I was subjected to serious indignities in South Africa, as I had fully apprehended I might be, then I said that I should not care to thrust myself on the Ministers. When, however, I reached Cape Town and actually saw how anxious the Union Government was to treat me with every consideration and how arrangements had already been made for my meeting not only my own countrymen at all important centres, but also members of the European community at these centres, the only thing left to me was to enter wholeheartedly into the spirit of the arrangements and utilise to the full the opportunities placed within my reach. To have done any thing else in these circumstances would have been to betray the cause which I had gone there to serve and to show myself unworthy of the confidence which my countrymen there had chosen to repose in me.

THE TOUR

Mr. Gokhale then described how his four weeks in South Africa were spent in visiting important Indian centres, meeting not only the heads of Indian residents in that country, but also a large number of Europeans, many of them men of note, addressing meetings sometimes composed exclusively of Indians, sometimes of Europeans, but more often mixed gatherings of both Europeans and Indians and discussing the several phases of the question in interviews and at conferences with leading men of all shades of opinion and representing various interests. After examining the whole question from every point of view, Mr. Gokhale met the Ministers—General Botha, General Smuts and Mr. Fischer—on the 14th November at Pretoria in a long interview lasting for two hours, when they went over the whole ground point by point and there was a full and frank interchange of views, the Ministers promising a careful consideration of the case submitted to them and they on their side explaining what they considered to be the special difficulties of the position. On the following day Mr. Gokhale had an opportunity of laying the whole matter before the Governor-General, H. E. Lord Gladstone, and then he left South Africa feeling satisfied in his own mind that he had done all that he was capable of and bringing away with him the liveliest recollections of the wealth of affection lavished on him by his countrymen there, of the extreme kindness with which the European community had treated him and of the great consideration and courtesy shown to him by the Union Government.

A POSITION OF DIFFICULTY.

Proceeding Mr. Gokhale said:—Before I attempt to give you an idea of the state of things as I found it there I should like to make one or two observations of somewhat personal character. The first is about the extreme difficulty of my position in South Africa. Never before in all my life, I assure you, had I to walk on such difficult and delicate ground, nor did I ever feel so oppressed with a sense of responsibility as during my four weeks in South Africa. Even the special courtesy and consideration shown me by the Union Government, while it undoubtedly facilitated my work, added in a way to my difficulties, for, while one section of the European community—the extreme anti-Indian section—was resentful that such consideration should have been shown to me, those who represented the better European mind, though satisfied at heart that the right thing had been done, were nervous as to whether undue advantage might not be taken of the position to put a false interpretation on what had been done. On the Indian side, on

this other hand, the feeling in the matter was one of rather excessive jubilation. In such circumstances, a thoughtless act or even an unguarded expression, not only on my part but on the part of any one of our countrymen there,—and they were meeting me daily in most enthusiastic demonstrations—might have resulted in serious unpleasantness and embarrassment all round, inflicting an injury on the cause difficult soon to remedy. Throughout my four weeks, the dread of this possibility never left me for a moment and constantly weighed me down, and I thank God here to-day speaking in your midst, as I did at Pretoria on the occasion of my last speech in South Africa, that no untoward incident marred the smooth progress of my visit and that even if no actual good results from my labours there, at any rate I am happy to feel that I have done no harm.

MR. GANDHI.

My second observation will be about my dear and illustrious friend, Mr. Gandhi. Ladies and gentlemen, only those who have come in personal contact with Mr. Gandhi as he is now, can realise the wonderful personality of the man. He is without doubt made of the stuff of which heroes and martyrs are made. Nay more. He has in him the marvellous spiritual power to turn ordinary men around him into heroes and martyrs. During the recent passive resistance struggle in the Transvaal—would you believe it?—twenty-seven hundred sentences of imprisonment were borne by our countrymen there under Mr. Gandhi's guidance to uphold the honour of their country. Some of the men among them were very substantial persons, some were small traders, but the bulk of them were poor humble individuals, hawkers, working men and so forth, men without education, men not accustomed in their life to think or talk of their country. And yet these men braved the horrors of jail life in the Transvaal and some of them braved them again and again rather than submit to degrading legislation directed against their country. Many homes were broken in the course of that struggle, many families dispersed, some men at one time wealthy lost their all and became paupers, women and children endured untold hardships. But they were touched by Mr. Gandhi's spirit and that had wrought the transformation, thus illustrating the great power which the spirit of man can exercise over human minds and even over physical surroundings. In all my life I have known only two men who have affected me spiritually in the manner that Mr. Gandhi does—our great patriarch, Mr. Dadabhai Naoroji and my late master, Mr. Ranade—men before whom not only are we ashamed of doing any thing unworthy, but in whose presence our very minds are afraid of thinking anything that is unworthy. The Indian cause in South Africa has really been built up by Mr. Gandhi. Without self and without stain, he has fought his great fight for this country during a period now of twenty years and India owes an immense debt of gratitude to him. He has sacrificed himself utterly in the service of the cause. He had a splendid practice at the Bar, making as much as £5,000 to £8,000 a year, which is considered to be a very good income for a lawyer in South Africa. But he has given all that up and he lives now on £1 a month like the poorest man in the street. One most striking fact about him is that though he has waged this great struggle so ceaselessly, his mind is absolutely free from all bitterness against Europeans. And in my heart nothing warmed my heart more than to see the universal esteem in which the European community in South Africa holds Mr. Gandhi. At every gathering,

leading Europeans, when they come to know that Mr. Gandhi was there, would immediately gather round him anxious to shake hands with him, making it quite clear that though they fought him hard and tried to crush him in the course of the struggle they honoured him as a man. To my mind Mr. Gandhi's leadership of the Indian cause in South Africa is the greatest asset of that cause and it was an inestimable privilege to me that he was with me throughout my tour to pilot me safely through my difficulties.

THE POSITION ANALYSED

Proceeding to describe the position of the Indians in South Africa, Mr. Gokhale said that the Union of South Africa consisted of the four Provinces—Cape Colony, Natal, Transvaal and Orange, and in the whole Union there was a total Indian population of about 150,000 persons. Of that, roughly speaking, about 120,000 were in Natal, about 20,000 were in the Cape and about 10,000 were in the Transvaal. In Orange there were hardly any Indians, the total number not exceeding 100, as some years ago the Boer Government of that time forcibly expelled from the Republic all Indians except such as were domestic servants. Four fifths of the entire Indian population in South Africa represented indentured labourers, ex-indentured labourers and their descendants. The remainder were free persons who had gone there at their own expense in the wake of the indentured labourers. One peculiarity of the position which the meeting had to realise was that there was no educated class among the Indians in South Africa similar to the educated class of this country—the men who followed, what were called, learned or liberal professions being so few as to be counted on one's fingers. The bulk of the people were either tradesmen or working men and a few were domestic servants. The traders were most of them petty traders, though some were fairly substantial. Speaking roughly, there were about 2,000 traders and 5,000 to 6,000 hawkers in each one of the three provinces mentioned. Of the working men a large proportion were still serving their indentures, while the rest were ex-indentured labourers or their descendants. In the Cape Indians could acquire both the Municipal and the political franchise. In Natal they had the Municipal franchise but not the political and in the two Dutch provinces they were rigorously excluded from both the Municipal and the political franchise. The present Immigration Law was different for the different provinces. In Cape Colony and Natal Indians could enter only by passing a test in a European language and the average number of such immigrants for the last few years was between 40 and 50 for the two provinces together—a surprisingly small number. In the Transvaal and Orange no Indians were at present prohibited altogether from entering. The traders' and hawkers' licences in Cape Colony and Natal had to be renewed every year and the grant of new licences lay in the discretion of local authorities manned almost entirely by the European trade rivals of Indian traders. In the Transvaal, on the other hand, licences had to be granted as a matter of course for the mere tender of a licence fee. But there were two Laws in force there, known as the Gold Law and the Township Act, the combined effect of which was to make those licences practically worthless. Wherever an area was declared to be a gold area under those Laws, Indians could only reside and trade in special locations situated, as a rule at some distance from the towns. In Cape Colony and Natal, Indians could own land or acquire other immovable property, which they could not do in

drove men into paths of crime and women into lives of shame. One of the most harrowing sights at which Mr. Gokhale had to be present was a meeting in Durban of those who were liable to pay the £3 Tax. About 5,000 persons were present. As man after man and woman after woman came forward and narrated his or her suffering due to the Tax, it was impossible not to feel overwhelmed by feelings of indignation, pity and sorrow. One old woman of 65 was there who had been to jail six times for inability to pay the tax and Mr. Gokhale could not recall the case even after that interval without emotion. As things stood, unless a fairly satisfactory settlement was soon arrived at it would not take many years for the Indian community of South Africa to be practically harassed out of the country after undergoing great suffering and losses.

POSITION OF EUROPEAN COMMUNITY

That was the position of the Indian community as he found it. He wanted next to describe to them briefly the position of the European community. They were a handful of people—only about a million and a quarter in all—in the midst of a vast indigenous population at a totally different grade of civilisation. And the contact between the two races had already created grave problems—social, political, economic and moral—which were already tilting the European mind in that sub-continent with uneasiness, misgivings and even dread. And they found in the midst of their difficult and complicated situation a third element introduced, belonging to other civilisation and representing other modes of life and thought. It was true that the present number of Indians in South Africa was only a lakh and a half against 12½ lakhs of Europeans. But the Europeans felt that there were 300 millions of people in India and if Indians continued to come freely into South Africa, there was nothing to prevent several millions from going there and swamping the European community and practically making the country another India. The fear was based on an absolute misapprehension, but it was there, deep and strong and general and no useful purpose would be served by shutting one's eyes to it. In addition to this, there was, first, the tremendous colour prejudice which existed in that land—a prejudice felt even more by the Dutch than by the English—and secondly the dread of Indian competition on the part of small European traders, who felt that they could not hold their own against their Indian rivals in a fair field, owing to the Indians' less expensive scale of living. The combined result of all these three causes was the present harsh and oppressive policy towards Indians—a policy plainly directed to making the lot of the Indians in that country so hard as practically to compel them to leave the country or, if remain they must, to remain there as a servile degraded and depressed community.

A GRAVE SITUATION.

Such was the position—grave, anxious and extremely difficult. What was to be the way out of it? So long as the European mind in South Africa was dominated by the fear of a serious influx of Indians swamping the Europeans, so long there was no chance of securing leave alone absolute equality—even reasonable, just, and humane treatment for our countrymen such as would enable them to live in peace and security and steadily advance to the position of a worthy element

in a self governing community. Even the best friends of Indians among the Europeans in South Africa—and there was a small section that could be thus described—were convinced that unless the fear of being swamped was removed from the European mind, they were powerless to urge with any effect the peace of more justice and more humane treatment of the Indian community. Another section, a much larger section, that had the sense of fairness to feel heartily a-bashed of the present policy pursued towards the Indians, would also then, but not till then, sympathise with the struggle of the Indians against their present treatment. The Indian community of South Africa itself also clearly felt the necessity of removing that fear, groundless more or less though it was, in view of the fact that the average number of free immigrants during the last few years had been only between 40 and 50—a number, however, which the ordinary European there did not accept and could not be persuaded to accept as correct. For some time past, therefore, the policy of our countrymen in South Africa under the leadership of Mr. Gandhi was, while insisting on maintaining intact their theoretical rights as equal subjects of the Empire in the legislation of the country, to strive for such a modification in practice of the present policy of injustice and oppression as would enable the community to live and prosper in peace and security and steadily advance in status and importance in that land. And even the briefest visit that one could pay to South Africa would satisfy one that that was the only wise, sound, practical, and statesmanlike course for the Indians to adopt in existing circumstances. It was in accordance with that cause that in the compromise which was arrived at between Mr. Gandhi and General Smuts last year, under which the passive resistance movement was suspended, the Union Government agreed not to make any legislative differentiation against Indians in the proposed new emigration law. Mr. Gokhale on his side agreed that in practice the discretion vested in the executive administering the law might be exercised by the administration as it thought reasonable, subject to a minimum number of Indians being admitted every year to supply the higher needs of the community and replace its wear and tear in certain directions. That minimum was six Indians for the Transvaal, where under the existing law no Indian whatever was admitted. For the whole Union a minimum now asked was forty, which was the present number of free immigrants annually on an average of seven years. The essence of the compromise was that by removing legislative inequality the theoretical rights of the Indians as subjects of the Empire should be maintained, while by agreeing to a limitation of new immigrants to the present average number, the fear of an indiscriminate influx which haunted the European mind should be removed. Once that was done the Indians there could struggle far more effectively than at present for a juster, more equal and more humane treatment in other respects. Mr. Gokhale's own work in South Africa had been done on those lines. He did not ask for an inch either more or less than what the Indian community there had been asking. His one advantage was that he was enabled to have access to the European community as no other Indian had it beforehand and he was thus enabled to address his appeal for justice and humanity to the very heart and conscience of the European community, speaking to its members face-to-face.

PRESENT OUTLOOK.

In concluding Mr. Gokhale said:—Ladies and gentlemen, before I sit down you may well ask me what is now the outlook in South Africa. Well, the catalogue of our grievances there is so long that as General Botha said to me, in the course of our interview, even the strongest Ministry that could be conceived in South Africa to-day could not be strong enough to remedy those grievances all at once and if it attempted any such thing it would straightway be hurled from power. The situation is such that though we must keep up the struggle ceaselessly, we must not expect anything else than slow, though steady amelioration of our lot. But I think in certain matters relief will be forthcoming almost immediately. In the first place, I fully expect that the provisional settlement arrived at between Mr. Gandhi and General Smuts as regards the passive resistance movement, which the Government found itself powerless to carry through Parliament last session, will be successfully carried through this year. The actual working of the Emigration Law also will, I expect, soon become milder and more considerate. Then that outrageous impost, the three pound license tax, will, I fully expect, go in the course of this year. In fact, I may mention that Ministers have authorised me to say that they will do their best to remove the grievance as early as possible. In the matter of education also the position will materially improve and the actual administration of laws such as the Gold Law and Township Act will tend to become less and less burdensome. In one respect, however, I fear the position will not soon change for the better and it is even possible that it may even grow worse before it becomes better. And that is in regard to trading licences. Here, however, our community is fighting for bare justice. And it has behind in the matter the sympathy not only of the Government of India and of the Imperial Government but also of the better mind of the European community in South Africa. And in the struggle if only we in this country do our duty properly our countrymen there will win. And this brings me to my concluding observations.

Ladies and gentlemen, I strongly feel, many friends of our cause in England and South Africa also feel, that so far India has not done her duty by her children across the seas struggling to uphold her honour amidst unparalleled difficulties. One man amongst us it is true, has set a great and glorious example—my friend Mr. Ratan Tata—whose name I assure you, is held in the deepest affection and gratitude by the Indian community in South Africa. A Committee in Madras has also done some work, and the Committee here has collected some funds, but all these taken together amounts to but little, considering the issues involved, I hope, however, that whatever may have been our remissness in the past, we shall do better in this respect in the future. Remember finally that it is not merely the interests of the Indian community in South Africa alone that is involved in the struggle, but our whole future as a nation in this Empire is involved in it. In proportion therefore as we do our duty in the matter, shall we have advanced more and more towards a position in this Empire more worthy of the self-respect of civilised beings. In proportion as we do this duty shall we have deserved well of our country, of our children and our children's children.

THE WORLD OF BOOKS.

[Short Notices only appear in this section.]

The History of Aurangzib. Vols. I and II by Professor Jadunath Sarkar—*M. C. Sarkar & Sons, Calcutta—Rs. 3-8 each Vol. To be had of G. A. Natesan & Co., Madras.*

Aurangzib's reign is remarkable as witnessing at once the fullness to which the power of the Crescent attained and the uprising of Hindu nationality which finally destroyed it. The tracing of the process, by which the grandly conceived, well adjusted and beneficent structure of the quasi national Empiro of Akbar came to crumble under the hand of his imperious, unsympathetic and bigoted great grand-son, is a valuable contribution to the furtherance of our knowledge of our national history. Professor Sarkar basing his work mainly upon Persian sources, upon the Court Annals and Bulletins, contemporary monographs and the private letters of the Emperor himself is naturally able to present us with a remarkably accurate picture of his action and policy which led to the dismemberment of the Empire. While allowing due credit for the accounts of the Moghul Court by Bernier and Tavernier, Minucci and Manrique, the author deprecates their occasional reliance upon slender bazaar-rumour and insists upon the superiority of the evidence furnished by contemporary and indigenous histories and letters.

The first volume exhaustively deals with the Deccan campaigns of Aurangzib before he became emperor, while the second brings the narrative up to the close of the Fratricidal war in the middle of 1658 A.D. The work is especially valuable to the South Indian student who is unable to get into active touch with the original authorities on account of his ignorance of Persian and Urdu. We await with great eagerness the publication of the remaining volumes.

The Guarded Flame. By W. B. Maxwell; Methuen & Co.

This popular novel originally published in 1906, which ran through seven editions in three months of publication will be welcomed in its present form. The story is a powerful one of love and tragedy, in which the elements are mixed with a cunning hand, and the narration is full of charm and vigour.

In Abor Jungles *By Angus Hamilton—*
Georgs Bell & Sons, London.

Another valuable addition has now been made to the literature on Indian frontiers and frontier defence. The operations conducted by Major-General Bower in the summer of last year against the Abors, Mishmas and other tribes of the North East Frontier, have a wide and far reaching political significance. The task of safe guarding the Marches of Hindustan has been constantly becoming more arduous and expensive, and during the past decade there have been special influences at work along the China Tibetan border of our Empire which have necessitated an extension of the limits of British influence among the Naga Hills of Assam. The expedition had a deep political purpose underlying it and must not be judged merely as the avenging hand of the murder of Messrs Williamson and Gregorson and party. That the supreme command was given to General Bower a postmaster in the language of India's northern and at this time strangely aggressive neighbour, China, is itself an indication of the views entertained by Government about the importance of this expedition.

Nor had the mission a purely military and political significance, the surveying parties that were despatched to the Dihang River and to the Muihmi country, and the valuable ethnographic information acquired by these have substantially enriched our knowledge of the customs of the Mongoloid Hill tribes of the North East. The illuminating account here given must necessarily have a more than passing value. The volume might be regarded as a supplement to the monumental work of Sir Alexander Mackenzie, "The North Eastern Frontier of Bengal."

Scenes from the Ramayana (Idylls from the Sanskrit.) *By E. T. H. Griffith, M. A.*
Panini of ee, Lakhadgeranj, Allahabad

If Prophets made the Religions of other lands, the Poet made the religion of India. While philosophers refuted and speculated in their schools the great Epics inspired the faith and devotion of countless generations. In days gone by children learnt this sacred story from the loving lips of mothers and the illiterate listened enthralled to the village reciter and the expounding Pandit. Times have changed and the modern school boy has to make the acquaintance of his National Epics in an English garb. The Panini office has, therefore, rendered a service to the country by bringing out these beautiful little volumes.

The Philosophy of Change. (*The People's Books Series*) *By H. Wildon Carr; T. C. and E. C. Jack, London and Edin. Ed. net.*

Professor Bergson's philosophy marks a new era in the development of thought. His conception of the universe is attractive, and his distinction of its two aspects, one as it presents itself to the intellect of man, and the other as it may be known by his intuition, is a distinction which strikes the Indian thinker as analogous to the two points of view distinguished in the Advaitic system of thought. Explanations of the actual facts of conscious experience, personality, freedom, etc., conceived in the light of this conception, seem quite adequate and satisfactory; and the function which he assigns to the intellect of man in the onward flow of life, viz., that of serving the needs of the activity of life, furnishes ample justification for the Pragmatist to claim him for his own. The whole system bristles with ideas which are highly refreshing and stimulating. Every student of philosophy ought to seek the closest acquaintance with the system, and every general reader ought to acquaint himself with its general principles at least. Mr Wildon Carr has conferred a blessing on the reading public by expounding, in a neat, compact and intelligible form, the general principles of his system. The exposition has the authority of Monsieur Bergson himself to back it up, and this enhances the value of the book. We are told that the name, Philosophy of Change, was suggested by him. The leading points are very ably expounded in seven chapters under the headings of Philosophy and Life, Intellect and Matter, Instinct and Intelligence, Intuition, Freedom, Mind and Body and Creative Evolution. We strongly recommend the book to every reader who has any interest in the study of philosophy.

Oliver Cromwell and His Times *By Hilda Johnston—T. C. & E. C. Jack, London*

This unpretentious little volume describes in an interesting way the great historical episode of the life and work of the famous Puritan Statesman. Contemporary material available for writing his history is partisan and extravagant, and even the monumental works of Carlyle and Professor Gardiner on the subject are not entirely free from this defect. Credit is due to the writer of the present volume for taking an impartial attitude towards the hero which results in making the reader regard him neither as a typical tyrant nor an inspired prophet, but "a plain blunt man that loves his friends" solving all difficulties according to his honest convictions.

Dactylography: or the Study of Finger-Prints: The XX. Century Series. (By Henry Faulds: L. R. F. P., &c., &c.; Milner & Co., Halifax. Price 1/- nett.

The utility of finger-prints as affording an unerring basis of identification has long passed the stage of controversy, but it may not be generally known that the scientific study of the subject, and its practical discovery and application for the purpose of personal identity is of quite recent origin. The author is one of the few experts who first laboured in the field, his article "On the skin-furrows of the hand" published in *Nature* of October 28," 1880, being recognised as the first contribution on the subject. The book under notice is a very learned *resumé* of the up-to-date researches on the subject, and embodies the results of the latest investigations conducted by all the eminent authorities in this field, including the author himself. The volume which is very tersely written, is full of varied and interesting and very valuable information. Commencing with a very learned history of the subject, which is traced from the records of prehistoric times, the results of recent progress are summarised, and we are treated to a very interesting discussion of the biological rationale of the subject. The printing and classification of the patterns are also considered, and the book winds up with a bright description of the future prospects of the science. The Glossary and Index at the end of the book will be found very useful.

History of England. By V. A. Smith (Clarendon Press, Oxford)

This is a handbook of English History written by the well-known author of "The Early History of India." It is a book specially written for the use of Indian students by an author of established reputation. In his attempt to explain to the Indian youth in a simple way the institutions of England, which, though they may not present much difficulty to the English youth, require to be placed before the Indian youth in an intelligible form, the author has been greatly successful. The large number of illustrations that are printed throughout the book forms a distinctive feature of a handbook of the kind and should prove a source of great help to the students in giving them an insight into the manners, customs, and art of the different periods of English History. The book is to be welcomed further, for the attempt made in it for the first time to illustrate facts and institutions of English History by reference to similar facts and institutions in Indian History.

The Introductory Study of the Bhagavatgita. By C. V. Narasinga Row Sahib, B.A., B.L., The Brahmavidin Press, Madras. To be had of G. A. Natesan & Co., Madras Price Rs. 1 8.

This work purports to be a systematic exposition of the Gita, that invaluable treasure-house of inspiration to all Hindus. The book has been approved by His Holiness the Head of the Uttara-radi Mutt and other Madhwa scholars as a correct exposition of the Principles of the Dwaita system founded by Sri Madhavachariar, though the author claims that his study is of the Gita itself, without reference to any particular commentator. There are chapters treating of the Cosmogony, the Religion, the Ethics, and the Philosophy of the Gita, and this will show the many-sided exposition pursued by the author. The special feature of the book is that the original texts are set out in full, with literal translations throughout. The book is sure to be read with profit and pleasure by all lovers of our religion.

Marriage. By H. G. Wells: MacMillan's Colonial Library.

This is not an essay or even a serious discourse on this well-worn theme, but a novel of absorbing interest and power. Readers of Mr. Wells's novels are accustomed to expect a highly-seasoned and well-digested *Olla Podrida*, and the volume before us is not likely to belie their expectations. All the social and industrial problems, fads, follies, and fashions of the time, come in succession for varied treatment of the well-known kind under the author's trenchant and original pen.

A Study in Karma. By Annie Besant, Published by the Theosophist Office, Adyar, Madras.

This is a lucid and eloquent exposition of the Indian doctrine of *Karma*, the law which Sir Edwin Arnold has described thus in *The Light of Asia*,

Such is the Law which moves to righteousness,
Which none at last can turn aside or stay;
The heart of it is Love, the end of it
Is Peace and Consummation Sweet, Obey!"

What underlies the conception of *Karma* is the idea of law as governing human actions. Hinduism teaches us that though tendencies acquired in previous lives are strong, it is possible to turn back the current of our tendencies by unselfish work and Divine Grace. This doctrine is as rational as it is consoling and is developed with great power and beauty in this book.

Diary of the Month, Nov.—December 1912.

November 22 The Rev Lewis Principal of Bishop Cotton School, Simla, and Mr Biernacki read interesting papers on the educational problem, at the Diocesan Conference, at Lahore.

November 23. It has been resolved by the Calcutta Senate that a life size portrait of Mr. Palit in oil be placed in the Senate Hall and that a marble statue of Mr Palit be placed in front of the proposed College of Science

November 24 Sir William Dunn, K.C.I.R., Agent of the East Indian Railway, died to day as the result of a fall from a fast train

November 25 His Honour the Lieutenant-Governor of the United Provinces received an address of Welcome to day from the Kahatriya Upkarni Mahasabha in Government House, Allahabad

November 26. H. E. the Viceroy delivered an interesting little speech at the opening of a People's Park at Bikaner to-day

November 27. The All-India Muslim League at Lucknow passed several important resolutions touching Mahomedan interests

November 28 Seventy six American tourists arrived at Bombay by the Cleveland

November 29. The Hon'ble Syed Ali Imam, Law Member, arrived at Lucknow this morning and lunched with His Honour and Lady Meston at Government House

November 30 At a Meeting of the Senate of the Calcutta University this afternoon it was decided that a University Chair of Indian History, named the Carmichael Chair, be established.

December 1. The death occurred this afternoon in Calcutta of Raja Benoy Krishna Deb Bahadur, President of the Sahitya Sabha

December 2. Lord Crowe, speaking at Cheltenham, controverted at great length Mr Bonar Law's statement as to fiscal policy towards India.

December 3. H. E. the Governor of Bengal to day received a deputation at Calcutta from the Anglo Indian Association, headed by the Hon'ble Mr W. G. Madge.

December 4. The death has occurred, at Doochur, of Mr Saktiram Ganesb Doochkar, a well known Bengalee journalist and author,

December 5 Mr. Harold Baker, in reply to Sir John Roesen in the House of Commons to day said that the rule prohibiting the promotion of an officer against whom proceedings were pending had been initiated by the Government of India

December 6 H. H. The Nizam of Hyderabad has been gazetted an honorary Colonel in the British army

December 7 Presiding at the Annual Convocation of the Punjab University to-day, His Honour Sir Louis Dine, the Chancellor, made a strong plea for Oriental languages

December 8 In connection with the Punjab King Edward Memorial, a bronze bust of His late Majesty has been presented to the Lahore Medical College by Seth Sukhlal Kernam of Sreea.

December 9 To day Mr. Montagu, accompanied by his brother, the Hon. Lionel Montagu, and his Secretary, Mr. Field, arrived at Government House, Lucknow

December 10 In the House of Commons, Sir Edward Grey announced that the Powers cordially approved of the suggestion that the Ambassadors should engage in informal and non-committal consultations, and so facilitate an exchange of views regarding the Balkan crisis.

December 11. H. E. the Governor of Bombay this evening held his annual Levee at the commencement of the Bombay Season.

December 12. In the House of Commons Mr. Bonar Law drew attention to the criticisms of the financial management of the India Office, and asked for the appointment of a Select Committee to enquire into the matter.

December 13 The Hon Mr G. K. Gokhale arrived in Bombay from his South African tour amidst enthusiastic welcome.

December 14 His Majesty to-day inspected Mr P. A. De Laszlo's portraits of Lord and Lady Minto, which are destined for India (to be hung in the Town Hall, Calcutta.)

December 15 Mr. Montagu attended a party given in his honour by the U. P. Congress Committee to day

December 16. In an interview with a representative of the *times*, to-day in Paris Dr Danell, President of Bulgarian Chamber, pointed out that the Conference in London had no mandate to settle questions between the Allies, nor questions which war or peace might raise for Europe.

THE CONFEDERATE COCKS OF BALKAN.

[If all the telegrams that have been flashed to India from the seat of war in the Balkans were to be believed, Turkey has suffered severe reverses up to now and the armies of the Confederacy have all come out victorious.]

[With the kind permission of the *Hindi Punch*.]

TOPICS FROM PERIODICALS.

The Springhead of Indian Civilization.

England, India and the Balkan War.

In a recent number of the *Nineteenth Century and After* Mr. S. M. Mitra writes a valuable contribution on the above subject. He endeavours to show that the British rulers of India have a difficult task to perform in view of the troubles in the Near East. Incidentally he points out that the transfer of the capital to Delhi has enhanced the difficulties of the task.

After thirty years of balancing the Hindu and the Mahomedan in the Government of India found relief in the thought that they had built up a fairly substantial edifice for all practical purposes. But during the present century this balance has been considerably modified according to the conception of the importance of the two communities held by the modern rulers of India. For instance, when granting representation under the Morley-Minto scheme, preference was shown to the Moslems and again the recent change of capital from Calcutta to Delhi is another move in the same direction. Delhi is associated with the triumph of the Muslim and the final overthrow of the Hindu dynasty. Here is again another bid to try the British attitude towards the two communities. Shall England help Turkey because Indian Moslems would have it? The writer gives a decided negative.

My argument is by no means the permanent incapacity of the British to move without consulting the Moslem in India. Far from it. The unpreparedness of England to interfere in the Balkans is only temporary, and is due more than anything else to her too short-sighted bids for popularity—the Moslem preference in the Morley-Minto scheme, and the transfer of the Indian capital to a Moslem centre. The British now have to restore the equilibrium as it was in the closing years of last century. Once they have done this, they will be able to move which way they please as far as Turkey is concerned. But what British diplomatists should aim at is to be prepared; to have the Hindu ready on their side, and not to have to condole him when the Turks have forced a critical situation upon England.

In the current number of *The Modern Review* the place of honour is appropriately given to an English version by professor Jadunath Sarkar, M.A., F.R.S., of Babu Rabindra Nath Tagore's original essay on the subject in Bengali. In this paper the author shows that while Modern civilization is essentially urban, the springhead of the Indian civilization was not the City but the Forest.

Everywhere in the world the clashing of diverse intellects keeps the mind awake. When primitive men created their first city, they were not attracted by its civilization. They were forced to congregate together for purposes of self-defence. But whatever their original cause might have been, as soon as many men found an occasion to meet together in one place their individual wants and thoughts assumed a corporate shape and civilization was evolved of itself. But in India the case is entirely different.

Elsewhere we only see that men who are placed by force of circumstances in woods, grow savage. They are either ferocious like tigers, or stupid like the deer.

But in ancient India we find that the loneliness of the woodland did not overpower man's mind, but rather imparted to it such a force that the stream of civilisation issuing from those asuran homes has irrigated all India and its flow has continued unchecked to our own day.

Indeed in both the great ages of ancient India—the Vedic age and Buddhist age,—the forest has been the nurse of their life. Alike to the Vedic sages and to Buddha the mango-grove and the banyan shade were the centres of spiritual discourses. And even after all the ravages of foreign conquest, when the Chinamen, Huns, Scythians, Persians, Greeks, and Romans had swarmed the country and cities began to rear their heads among the woodlands, the heart of India was in the forest and in the pristine simplicity of the ancient hermits. In making these observations Mr. Rabindra illustrates from the writings of Kalidasa the peculiar tendency of Indian thought.

Race within the Christian Church.

The Rev. C. F. Andrews of Delhi writes a very important article on the above subject in the last number of *The East and the West*. He says that at present, as it has been in the past, promotion in the hierarchy of the Christian Church in India very largely depends on racial qualifications. In England and other countries merit and merit alone is the only requisite for the attainment of the bishopric. In India the case is different. Indian Christians, however high may be their qualifications for the post, have been systematically excluded from the high offices of the Church. They have seldom been raised to the dignity of a bishop. Even when lately one or two worthy Indians have been invested with the high order, their authority and power have been unreasonably curbed. For instance, an order has been passed by which a bishop, if he happens to be an Indian, should have no control over the English priests.

Besides this, the spirit of racial intolerance had been exhibited in various other ways as well. Indian Christians are not allowed to study in the same school with the English and Eurasian children. Europeans seldom invite native Christians to their parties. Respectable men who have abandoned their religion for the sake of Truth are discarded alike by the Christians and the non-Christians. The former treat them as inferiors because of their race, the latter because of their religion. Such is the state of things in India.

To such a hopeless condition were things reduced because the simple Apostolic principle was not followed of race equality in Christ. And yet we expect Indian Christians to regard themselves as members of one body with us! And we call upon them to renounce caste among themselves for Christ's sake!

The writer then deals with the question of the political environment in which the Church is called upon to bear its witness for Christ. The national movement in India and the colour bar applied to Indians by the Colonies are two points

of this nature. At a time of crisis, Lord Morley saw the danger of the situation and by his reforms acknowledged that in the eye of the law Indians are fellow subjects of the Crown. What little remained to be done in the way of reconciliation was done by his Majesty's simple and touching solicitude for his Indian subjects. The colour bar is yet to be adequately treated. In South Africa, in Australia and Canada alike honest and worthy Indians are subjected to ill-treatment which is discreditable. It is blasphemous in the eye of God and man. The prejudice seems to have gone too deep for either argument or irony. It bids fair soon to become a hard, ingrained convention,—

Heavy as frost, and deep almost as life.

What then is the Church to do? Shall it also perpetrate the same blunder and bring about hatred and enmity? Shall it not stand forth to champion the cause of justice, and righteousness and vindicate the divine commandment? Shall it not stand for amity and brotherhood? The writer concludes—

It may seem at first sight a small thing to contend for so earnestly and insistently—that a few Indian Christian children should be admitted into the English Diocesan Hull schools, that English residents should invite, quite naturally and spontaneously, Indian Christian gentlemen and ladies to dinner on terms of perfect social equality that when here and there an English Christian, in pure and blameless love, marries an Indian Christian, such marriages should be welcomed, and not boycotted by the Church, that Indian bishops should be appointed to territorial dioceses in India and ordain English clergy and confirm English children resident in such dioceses. To those in England, who hardly know what race-feeling exists abroad, the wonder will probably be felt that such points should have to be contended for at all. In India, however, and elsewhere, the contention is so vital that the Christian faith would be very seriously compromised, if such exceptional cases I have mentioned were not allowed and welcomed.

The Rule of the dead in Japan.

In the November issue of the *Japan Review* there is an entertaining article on the above subject from the pen of Mr J Ingram Bryan, M. A., M Litt, B D, rh D. In the course of his interesting paper he illustrates some of the most important traits of Japanese character. The most unique feature of Japanese life, says the writer, is its unchanging faith in the spirits of the dead and its absolute submission to their rule. It is in fact the fruit of Shintoism which is the ruling religion of the island.

The Japanese believes that he is perpetually surrounded and permeated with the myriad lives of the past. It is a common belief of the people that the happiness of the dead depends on the respectful and loving service of the living and that the happiness of the living depends on the due fulfilment of pious duty to the dead. Accordingly each home has its family altar, its god shelf where are enshrined the ancestral tablets before which every morning and evening the sacred lamp is lighted, food offered to the spirits of the dead, and prayers said. To forget them or to treat with indifference these daily amenities is to be counted irreligious and immoral in Japan. Unbounded obedience to, and veneration for, the dead are cardinal virtues in the Japanese ethical code.

Out of these conditions grows the statement that with the Japanese manners are morals, and etiquette is ethics. Indeed in Japan no distinction is drawn between morality and religion, between ancestral custom and individual life. Hence

in the Land of the gods, the living and the dead are interdependent, and the national, social, and domestic ideal is that they shall live in august union and unbroken concord. Neither can dispense with the help of the other. The visible and the invisible worlds are for ever united by bonds innumerable of mutual necessity, and no single relation of the union can be severed without the surest consequences. The combined forces of the living and the dead, (but the living under the direction of the dead) are the rulers of modern Japan and the shapers of its destinies.

Daniel O'Connel as an Advocate.

Mr. J. A. Lovat-Fraser in a luminous article in the November number of *The Law Magazine and Review* considers O'Connel both as an advocate and politician. O'Connel was indeed one of the finest advocates in the annals of English law, and in May 1798 he was called to the bar and faced the world, as one of his biographers says, "with a powerful frame and constitution, a stout, hopeful heart and above all, a vigorous domineering brain, full of all the subtleties and resources of an acute lawyer, and all the commanding energy of a consummate popular leader."

The writer says that, at the bar, he was pre-eminently the counsel of the man in the dock and to the end he was the greatest criminal advocate. His learning in all departments of his profession was unquestionable and profound. He was master of two gifts that were of the greatest value. He had an extraordinary power of subtle cross-examination, and a remarkable command of varied, impassioned, persuasive eloquence. He played on the passions and prejudices and weaknesses of the jury as on a musical instrument. He showed his genius as an advocate but seldom for personal display. There were indeed occasions when he looked on the Judge with scorn and disdain. But in the main he was only too mindful of his case. Here is an instance of his sudden repartee for which no answer was possible. When he interfered in the case that another counsel was pleading the Judge put in a remonstrance:—

"When I was at the bar," said the Judge, "it was not my habit to anticipate briefs." "When you were at the bar," replied O'Connel, "I never chose you for a model, and now that you are on the bench I shall not submit to your dictation."

O'Connel as a politician was eminently a working speaker. He never scrupled to repeat himself. The same qualities that enabled him to shine in the bar made him equally shine as a leader of men.

The Future of Socialism in India.

Mr. Sundara Raja writing in *The Socialist Review* for November on the above subject says that of the numerous forces working for the upheaval of the East the one vital thing is the spirit of Socialism. It is very often misunderstood owing to ignorance and also because of the misinterpretations of the Anti Socialists in the West.

Socialism is not the end, the goal of all progress, it is a means to the end. It comes to break the chains of social oppression, to soothe and heal the wounds of the poor, to show the way to a higher freedom and happiness. It is the forerunner of a perfect social, industrial, and political life. It is the organic form of democracy. It is sublime, being the negation of autocracy, plutocracy, and oligarchy; it is divine, being the incarnation of the will of Providence operating in all parts of the world for reforming mankind. Socialism is a record of generations of human hope, an epitome of all righteous deeds done by mankind, a short sketch of our duties and rights. It is in its highest purpose, a religion, suffusing optimism in the practical sphere of life, and providing a thought feeding, stimulating source in the intellectual.

The writer continues that the three great countries which are bound to play an increasing part in the history of Socialism in the East, if not in the world, are India, China and Japan. Now in India the factors to be contended against are the extreme poverty of the people, the rapacity of the money lenders and the exclusive spirit and arrogance of the religious hierarchy—the Brahmins. All these have been standing in the way of national unity.

But these are slowly giving way before the spirit of Socialism. The writer thinks that India is peculiarly fit for the working of the Socialistic programme. In the first place in India, excepting the limited savings of a few which are in no sense considerable, there is no concentration of wealth in the hands of a class of capitalists as in the West. India again is essentially an agricultural country and she cannot be overtaken by the dangers attendant on industrialism. Besides Socialism supplies an ideal *par excellence*. "No other power than Socialism can achieve the freedom and advancement of India." The hope of India, conceives the writer, lies only in Socialism.

A Plea for Indigenous Literature.

In the November issue of *East and West* Mr. Syed Abdulla Brelvi, M.A., writes an interesting paper entitled "The Triumph of Science and the Wail of the Muses in India."

More than a century has elapsed since Coleridge elaborated his views on the antagonism of science and poetry. Clough and Matthew Arnold poured forth their indignations against the dominance of Science over art and literature as soon as "Birmingham and Manchester had begun to rear their smoky heads, and men had settled down to the sordid tune of money-making. Keats rebelled against his contemporary tendencies and found peace in the classic beauties of Hellas and in the romance of Mediæval Europe. Wordsworth himself expressed the brutalising influence of the Scientific spirit in the lines:—

Man who would peep and botanise
On his Mother's grave.

But in our own days, we have realised something of the beneficial influences of science. Men have begun to reconcile science with religion. Other men have begun to conciliate science with poetry. There have been instances in which men of poetic sensibility have advocated researches in science. The scientific temperament has been shown to be not absolutely antagonistic to the spirit of the Muses. But the danger in India is that the attention of the people is entirely devoted to the cultivation of science. The claims of Literature and Arts have not been put forward as vigorously as they need to be.

The real literature of the country—the literature which reflects its highest genius is that which is embodied in the living language of its people. It is here—in the state of the vernacular literature of India that we find the confusion worse confounded. The writer therefore concludes with an appeal for national organizations and co-operation for the promotion and encouragement of indigenous literature.

India's Old and Beautiful Arts.

In the latest number of the *Dawn Magazine* is published Major J. B. Keith's letter to the Editor which shows that the learned writer is yet interesting himself in the Arts of ancient India. He is altogether against interfering with the manners, customs or religion of the Indian people and has an immense admiration for their philosophy. He says—

At the same time, while I think Female Education is a very delicate subject, I should like to see Native Ladies interest themselves in the cause of Native Art and although the efforts of Mrs. Annie Besant and Mrs. F. A. Steel and other Ladies are to be commended and admired, I wish Native Ladies could unite more about themselves and India than they do. The *Pax Britannica* has done a great deal, but I think if we could unite the virtues of the Hindu Family and the Saxon Individual it would be much better. Sir T. Morrison might have been a good teacher in the Mahomedan College of Allypore and has a taste for Economic Statistics, but he knows nothing about Indian Workmen and probably never was in a *Kharakana*. There is no analogy between the wants of India and of Europe, while the action of physical laws is quite different.

For instance, in Europe the labour movement has caused immense trouble owing to exploitation but in India, he fears, under different conditions it will be infinitely worse. For he wholly distrusts Individualism in a Collectivist country. If we want economic peace in a country like India where the many have small incomes, what we want is to encourage small industries. And yet there is plenty of room for the Machine without despoiling the poor but it must be recollected that multiplied Trade Returns and Parsi Millionaires are no evidences of the prosperity of the Working Classes. For the sociology of India is entirely different from that of Europe.

He is absolutely in agreement with Mr. Havell in all his multifarious proposals. He says that Mr. Havell has right ideas on the subject of Art. He concludes with a warning regarding the New Delhi.

New Delhi is now an accomplished fact but I do not believe in Imperial Delhi. A philosophic writer—(Charles Pearson ("National Life and Character")) says India will one day return to its original formation—decentralized States, and I believe it.

Science and Islam.

Mr. Shaikh Ferozuddin Murali, M. Sc., B. A., M. A. S. I., writes an interesting paper on Science and Islam to the recent number of the *Hindustan Review*. In the course of his article the writer proves that the Mussalmans of the early ages were earnest votaries of Science, that they were the real promulgators and originators of the so called Modern European Sciences and that it is only through incomplete and superficial knowledge of the principles of Science or the canons of Islam that there can be any possibility of a conflict between Science and Islam.

The writer says that Islam is essentially a rational and cosmopolitan religion but that there is no place in it for the ignorant. No Mussalman can afford to do without acquiring knowledge. It is quite a different thing to say that the Mahomedans of to day are not well educated and show no special aptitude for learning. It is a direct outcome of their general laxity in the pursuit of religion. Even non-Muslims eulogise the literary and scientific spirit of Islam. Prof. T. W. Arnold quotes a French writer having said:—

"Islam is a religion that is essentially rationalistic in the widest sense of the term considered both etymologically and historically. The definition of rationalism as a system that bases religious belief on principles furnished by reason, applies to it exactly.

The simplicity and the clearness of the teachings of Islam are certainly amongst the most obvious forces at work in the religious and missionary activity of Islam. It cannot be denied that many doctrines and systems of theology and also many superstitions, from the worship of saints to the use of rosaries and amulets, have become grafted on to the main trunk of the Muslim creed. A creed so precise, so stripped of all complexities and consequently so accessible to the ordinary understanding might be expected to passers and does indeed possess a marvellous power of winning its way to the consciences of men."

The writer then quotes numerous passages from the Quran to illustrate his point.

It is a pity, says the writer, that with such a glorious past as the Mahomedans can boast of, they should behave in such a way that their people Europe should taunt Islam as a religion opposed to progress and science.

The Domiciled Community in India.

The question of the Domiciled Community in India has been in the forefront since the days of Lord Curzon. But except a few posts here and there in the Railways or Government Service for which they have been chosen in preference to the candidates of the other communities nothing definite and lasting has been done by the Government or by the Anglican Church by way of ameliorating their position. Mr. H. P. K. Skipton in the course of an elaborate survey of their condition and needs in the last number of *The East and the West* offers some valuable suggestions for their uplift. So far as conversions to the Christian faith are concerned they have mostly been among the lowest order of the Indian people. It is suggested that these conversions are not of much value since the heathens converted are among the lowest order of people and the fact of their ignorance enables the mission to succeed. Again beyond the difficulty of convincing the acute and intelligent Brahmins the secular education that is given in the scheme and colleges have made them mostly apathetic to questions of theology. But above all the condition of those already converted is not very encouraging. Their position is thus depicted by Mr. Hallward.

The rest of their time is divided between the streets of Calcutta and homes which are often utterly unfit for children. The hopeless improvidence of most of the poorer class of Eurasians is notorious, and the absence of any system of compulsory education enables parents of this class to "trust in Providence," in other words, to divest themselves of all responsibility for their children's education, and sometimes even for their food and clothing as well. The result is that a political and social evil of no inconsiderable magnitude is being engendered in our midst, and the pauperization of the needy white and half-caste population is increasing with dangerous rapidity. For, unless these unfortunate children are rescued from the streets, and from the clutches of drunken, careless, and vicious relatives, they will infallibly swell the ranks of the "never-do-wells" and out-castes of society.

It is indeed a deplorable state of things. To remedy the defects of their education and status the S. P. G., and the S. P. C. K., have given no little help from time to time. But it is not enough. A systematic attempt must be made both by the

Church and by the Government to afford them facilities for betterment.

If a Christian education were bestowed upon them, their manners, habits, and affections would be English, their services of value in the capacity of soldiers, sailors and servants, and a considerable benefit would accrue to the British interest in India.

The Catholics are setting the best example in these respects. If the Eurasians and Anglo-Indians are made typical of European culture and physique their utility in times of trying circumstances will be invaluable. They would naturally be most loyal to the Government and their assistance to the Empire will be second to none. Indeed it was they that helped to quell the Great Indian Mutiny and their well-being and adherence to the cause of the British Empire will be a bulwark of strength to the British Raj.

A Great Buddhist

The late Venerable H. Sri Samangala, Chief High Priest of Adam's Peak and the Western and Southern Province, Principal of the Vidyodaya Oriental College, member of a dozen or more learned societies in different parts of the world, was a man—or a saint, rather—beloved for his humble piety and his profound scholarship. An unknown author gives an intensely interesting account of the dead saint's life and work in the October *African Times*. The task most dear to the heart of the great Buddhist was the revival of Oriental learning. He founded colleges, wrote books, and taught personally, all to further this object:—

Ven. Sri Samangala's attainments extended even to science. He was well conversant with arithmetic, Euclid, algebra, trigonometry, and mensuration. His knowledge of Ayurvedic medicine was far more extensive than that of any practising physician, although he never put it into practice. Ven. Sri Samangala was a formidable controversialist and keen debater, in addition to being a most persuasive preacher. Even in the early days of his priesthood the fame of his learning had spread far and wide, and envy and jealousy had combined to raise a formidable array of enemies to crush his growing fame. Firm in his own convictions, and undaunted by the established reputations of his opponents for artfulness and cunning in debate, he accepted every challenge, and came out of every controversy with honour, often winning over some of his adversaries to his side.

The Psychology of Buddhism.

The *Buddhist Review* for the last quarter of the year contains an interesting paper on "The Psychology of Buddhism" by Mr Joseph Bryce. The history of the thought of Europe during recent times is one "specialization." "We have had eminent theologians, scientists, sociologists, philosophers and psychologists who, by their several experiments and deductions have added to the sum total of human knowledge, but with all this vast accumulation of detail and information there is yet wanting in the West a synthetic philosophy—a system having some connection with human life as a whole." It was, says the writer, the realization of this defect that led Auguste Comte to frame his positive Philosophy.

In Eastern thought there is no such specialisation. In Buddhism we have religion, philosophy, ethics and psychology, all combined into one comprehensive system of thought, with the direct and practical purpose of meeting the deepest needs and aspirations of human nature—a philosophy applicable to every aspect of our complicated individual and social life.

The writer is struck with the identity of the ancient teachings with the results of modern investigations. It speaks much of the marvellous insight of the Buddha into the operation of natural phenomena that his conclusions should have been so firmly established by the laborious researches of the savants of the West. The theory of *Karma* is an established doctrine to day.

Buddhism then looks for the survival of the spirit of man, not in any spiritual sphere in the Western sense but in the evergrowing, progressive psychic life of the race. The soul, therefore, instead of being an individual entity as theology has supposed, is a composite unity and is subject to the law of dissolution and dissemination as are all composite existing things. That is the teaching of Buddhism, the final decision in the case of a psychological puzzle.

Kalidasa and Shakespeare.

In the *Dacca Review* Mr. Sitanath Das Gupta has an interesting article comparing Kalidasa and Shakespeare in their lives and genius. For the purpose of a suitable comparison the writer takes up "Sakuntala" of Kalidasa and "Romeo and Juliet" and "The Tempest" of Shakespeare. The love between Romeo and Juliet is a romantic love, intense, blind and verging on madness. It deranges the head and leads the victim to destruction. In short, it consists in a conquest of emotion over volition and the tragic effect of this play is of world-wide interest. Now comparing it with the performance of the Oriental dramatist, the writer says—

In point of intensity, the love of Romeo and Juliet may well be compared to that of Dushyanta and Sakuntala at their first meeting. But with this difference that whereas the volitional side of the Western play is conspicuous by its absence, that of the Eastern play is prominent by its presence. Here volition subjugates emotion. Here the intensity of love is softened to usefulness by prudence and by moral obligation.

He then gives profuse illustrations to show that the lyrical sensuousness of the two poets is almost identical. The same sweetness of expression and the same delicacy of emotion characterise the two poets. The writer then takes up the two characters Ferdinand and Prospero and shows how each poet is master of his art. Of Shakespeare it is needless to say much. The height of lyrical beauty could go no further. But after a psychological analysis of the two plays the writer concludes "that Shakespeare's Ferdinand is like Kalidasa's Dushyanta, with this difference: that while the latter borders on conventionality, the former is away from it." The writer proves this from a comparison of the two heroines Miranda and Sakuntala. The latter, concludes the writer, almost gives way under a heavy burden of love; nevertheless, she maintains her own bashful attitude, till she is forced by Dushyanta to follow him.

Thus he illustrates by a critical analysis of two important plays of either dramatists and concludes with a hearty appreciation of both their methods.

THE JUMA MOSJID, DELHI.

QUESTIONS OF IMPORTANCE.

Political Organisation at Delhi: A Scheme by Babu Govinda Das.

The necessity of making Delhi the centre of enlightened political activity is admitted on all hands, now that it has become the Capital of India. At present it is intellectually inert and politically dead, and for many years yet it cannot come up to the standard of Calcutta and of Bombay which are pulsing with intellectual, political and commercial life; yet still a beginning has to be made here, and the sooner the better, if the party working for a united and a progressive India is not to lose touch with the Central Government, and thus indefinitely delay the much desired consummation. The European community has not been slow to realise the immense advantage of having a powerful organ of their own at the newly created seat of the Government of India, the avowed friend and supporter of the bureaucracy, the opponent of Indian progress and aspirations, one of the most powerful of Anglo Indian dailies, the 'Pioneer' is removing from Allahabad to Delhi. The Mahomedan community have not lagged behind. "The Comrade," a Calcutta weekly, solely devoted to Mahomedan interests and an organ of Pan Islamism, is to be issued as a daily from Delhi. An Urdu daily is also going to make its appearance at Delhi. The Moslem League is going to remove its Headquarters to Delhi, the Hindu Sabha is also wishing to establish itself there, probably the Anglo-Indian Defence Association will also follow suit. It has become therefore doubly necessary that the party of Indian progress and reform which is working not for sectional but for national ideals, and which advocates equal, fair and impartial treatment to all, of whatever race, religion or creed, should have a political organisation of its own at the Capital to counteract, the forces of class and communal politics, to secure equitable and just treatment of all classes, and to mould the thoughts of the public and the policy of the Government with a view to the realization of the higher destinies of the peoples who inhabit this vast continent. The object is high and the mission is sacred, but without patriotic sacrifice and earnestness of purpose nothing can be achieved. In these days of agitation and representation, strong, active, alert and insistent political organisations are an absolute necessity, and a party without these is sure to have its political existence ignored however just may be the cause which it espouses and upholds. To have an organisation at Delhi of the party the aim of which is the national regeneration of the people of India as a whole it is necessary that the efforts of all the men of this party should be concentrated for the attainment of the object. That the suggestions made here are not premature will be easily understood when attention is called to the scattered provincial efforts being made to raise memorials in honour of the late Mr. Home of revered memory, the father of the Indian National Congress. In the very nature of things it will be impossible to raise sufficient funds in each province to perpetuate his memory in a manner which would have gladdened his spirit had he been alive. The best tribute to his life-long and strenuous work for the sake of India's uplift would be the foundation of institutions and the

formation of organisations which would carry on from day to day and year to year the work for the political amelioration of the Indian people and of nation-building. For this it is necessary that the idea of provincial memorials should be given up and that the funds collected by the provincial committees, necessarily modest as they will be, should not be scattered and wasted in statues and paintings, luxuries which the country is too poor to indulge in safely, but should be handed over for perpetuating the great man's memory in a reproductive form to a Central All India Committee which should be formed to raise sufficient money, to consider the nature of the memorial, and to take steps to organise institutions for carrying on the national propaganda on strictly constitutional lines.

To start with, a tentative scheme is outlined below indicating the scope of the work which should be taken up by the central committee, in the hope that a sufficient number of public spirited and large-hearted gentlemen may take up the idea and carry it to its fruition. The scheme provides for the starting of an English, a Hindi and an Urdu daily. The vernacular dailies should be published in easy language so that they may be understood by the common people. The scripts used would be Persian and Nagri, but the language and the matter of the two dailies should be the same. This will enable the paper to be brought out by one editorial staff. The Home Memorial Hall is meant for the holding of public meetings and for the Sessions of the Indian National Congress and the Social Conference which would gradually acquire in it a fixed and central home with all the advantages that it implies, and develop there in the course of not many years a settled constitution as an unofficial yet thoroughly national representative parliament, able to influence more and more effectively as the years pass the official Council sitting in its near neighbourhood. The club building will be self-supporting and will be available on payment of rent to the Members of the Council and to the members of an All-India Political Club. The residential quarters ought to be a great boon to the Councillors, as providing easy opportunities to them to compare notes and thresh out informally amongst themselves the questions to be pushed through the Council, and settle the necessary plans for the campaign. The club would on the nucleus of a fully equipped party organisation as in England, without which no active and fruitful propaganda is possible, nor the choice of the best candidates for the various constituencies. A good library is an indispensable adjunct, seeing that the needs of the editorial staff, of the Council members, of the Congress, of the Conference, will all have to be catered for. The removal of the Congress office to Delhi with a paid staff, and the opening of a Servants of India Society branch, for which a separate building (both in the same compound) may be provided, is also worth consideration.

In conclusion I beg to request you to kindly give your earnest consideration to what is stated above and to the annexed scheme, and to favour me with your views. I would be further obliged if you would kindly let me know whether you would be willing to become a member of the All-India Committee for considering ways and means of giving effect to the proposals herein outlined or to any other similar scheme.

DRAFT SCHEME.

1. To raise six lakhs of rupees as below for the carrying out of the objects hereinunder mentioned.

- (a) Three lakhs of rupees to be raised by shares.
 (b) Two lakhs of rupees to be raised by public subscription.
 (c) One lakh of rupees on guaranteed 5 per cent. Debentures.

2. Three daily papers, one in English, one in Hindi, and one in Urdu, to be started and issued from Delhi with a share capital of three lakhs mentioned in 1 (a) above.

3. To erect a Hume Memorial Hall containing accommodation for 5,000 men at a cost Rs. 75,000.

4. To construct buildings for an All-India Club having

(a) 10 sets of rooms with three rooms in each set, consisting of a sitting, a sleeping and a bath room.

(b) 5 sets of rooms with six rooms in each set, consisting of 2 sitting rooms, one drawing room, one bed room, two bath rooms, with outhouses for servants and cooking, the total cost to be Rs. 55,000.

5. A library and a reading room at a cost of Rs. 50,000.

6. A Congress office building attached to the Memorial Hall at a cost of Rs. 10,000.

7. Quarters for Servants of India Society, Rs. 10,000.

8. Establishment and other expenses of the above to be paid out of the interest of the balance of one lakh of Rupees which should be invested in Government or some other approved securities.

9. The Club buildings to be let out on rent to Members of Councils and other distinguished visitors, as also to members of the Club in accordance with the rules that may be framed.

ALL ABOUT DELHI

AN EXHAUSTIVE HAND BOOK

Compiled from Authentic Sources

With 86 illustrations

[COMPILED FROM VARIOUS AUTHENTIC SOURCES]

Contents—The Hindu Kings, Early Muhammadan Kings; The Moghul Emperors, Modern Delhi, Some Delhi Rights, Monuments at Delhi, The Storming of Delhi; The City Gazetteer, Lord Lytton's Durbar, Lord Curzon's Durbar, The King's Durbar of 1911.

In the preparation of this book free use has been made of Mr. Fannhawe's *Delhi: Past and Present*, more especially in the compilation of its last Chapter; of Dr. Fergusson's *Eastern and Indian Architecture* in the description of its great architectural glories; of the revised *Imperial Gazetteer* for the latest statistics relating to the city; of Captain Trevelyan's *Nicholson* for a description of the storming of Delhi; and of Mr. Reynold Ball's *Tourist's India* for a succinct account of its far famed Mounting Sites. Besides the standard writers on Indian History and the accounts of European and other travel to India during the Moghul period, much interesting information has been gleaned from Mr. Abbott's *Through India with the Prince*, Mr. Percival Landon's *Under the Sun*, Mr. O. W. Stoenes' *In India*, Genl. Gough's *Old Memories*, and Mr. Kerr's *From Charing Cross to Delhi*.

With thirty-six illustrations.

UTTERANCES OF THE DAY.

Sir Narayan Chandavarkar on Caste.

At the first Aryan Brotherhood Conference held on the 9th instant, at the Framjee Gowanji Hall, the Hon. Sir Narayan Chandavarkar, delivered his presidential address. After a few preliminary remarks he said—

Gentlemen,—In the circular inviting this Conference the statement was made, that in declaring itself against caste in the form in which it exists the Brotherhood was but taking its stand upon the humanising principles of the Vedas, the Upanishads, and the Bhagavad Gita. In some quarters the correctness of that statement has been challenged. By some others, we have been told that by appealing to these religious authorities and making them the basis of our attitude towards our fight against caste, we are using questionable ground, because we rely on the *Shastras* which, it is said, have enslaved the Hindu, instead of boldly taking our stand on Reason and condemning caste on the practical ground that it has led to much mischief and sapped the vitality of the people. This argument to which I am referring is one that has cropped up from time to time during these forty years of controversy over the problems of Hindu Social Reform; and I must beg leave to make as clear as I can the lurking fallacy of the argument.

KHASTRAS vs. REASON.

Man whatever we may say and however we may reason, is a creature of his environment, so are all great communities. And that environment is made by the past. The past is man's history, the present is his reason, both must combine and supplement each other for his future growth and progress. What is reason to-day becomes history to-morrow. So really speaking there is no necessary antithesis between historicism and rationalism, when those terms are used properly to understand and regulate the law of communal development. It is all very well and sounds very easy to say that for working out the problem of social reform, we must get rid of the yoke of the past and begin afresh and write on the clean slate of reason casting history and tradition to the winds. But you cannot do that without casting all the good of history with its bad; and even when you have done that, supposing you can do it, what you have written on the clean slate of society to-day becomes in due course to-morrow a category of the past and lives as a historic tradition. That is the meaning when we say that man makes history. If the past is society's tradition, its present is society's reason which means the need of adaptation to the changed and changing environment. And both tradition and reason must combine for social progress.

THE BHASTRAS AND CUSTOM.

The truth and force of this social law, I humbly think, in the minds of our *Brithas*, who made the Hindu law and our religious and social codes, when they put the idea in the shape of a formula, which has become the sheet-anchor of Hindu society, so much so, that it has passed into a proverb, used by many but abused by most. The sacred formula I speak of is in these words:

with one more quotation from the report of the Decentralization Commission. When the Commission said that the 'municipalities cannot make real progress if constantly kept in financial leading strings, nor can local self-government become a reality, if local bodies are habitually protected against themselves,' they struck the keynote of the main principles on which local self-government is founded. Municipal bodies are democratic institutions and they must be worked on democratic principles. But when a domineering bureaucracy introduced bureaucratic principles into the working of democratic institutions they produce hybrids of which the Palghat municipal muddle is a horrid example. It is not control that municipal bodies want so much as sound advice. As Mr. Blake Odgers observes in his excellent work on 'Local Government' every local authority is entitled to the advice of the Local Government Board, whenever it is in any difficulty, even though such difficulty be of its own creation. Control of the Imperial Government over municipal bodies with regard to sanction for loans and audit of accounts must always exist. But it is by useful advice that local bodies are to be helped. In India the difficulty of local bodies is that they cannot get such useful advice when they are in difficulties. The curt Government order which they often get when they are expecting helping advice is more often intended to mask the ignorance of the local Government itself on important municipal matters than to snub the unfortunate local body. I have often felt the necessity for some timely advice from some who is an expert in matters municipal. It is no fault of the average civilian official if his knowledge of municipal government is rather poor. He left home when he was a very young man and before he began to take any interest in municipal matters, and his experiences of municipalities is probably acquired at Palghat, or Kumbakonam or Tanjore—and we know what that is. The civilian official as a municipal adviser will not do. The next step in municipal reform that we ought to take is that simultaneously with the granting of the reforms suggested by the Decentralization Commission we must have an advisory board. A board consisting of an expert sanitary engineer, an expert sanitarian, an expert financial advisor, all with practical experience of municipal institutions, ought to be established under the Madras Government. The function of the board will be purely advisory. On receipt of a request from a municipality the expert whose advice is requested will go to the municipality concerned and after due investigation will give his opinion and advice on the point. It will be left to the municipality to accept or to reject such advice. The pay and expenses of such a board ought to be met by all the district municipalities in the presidency together, the board will not interfere with the work of the existing sanitary engineer or the sanitary commissioner or the accountant-general. Such an advisory board will be of immense assistance to the municipal bodies in this presidency. For as John Stuart Mill said, 'power may be localised, but knowledge to be most useful must be centralised.' We are not all municipal experts, and municipalities in India are apt to make mistakes like municipalities in other countries. It is by our mistakes that we learn. We are, however, fortunate that we have at present as head of the administration in this presidency a statesman who possesses intimate practical acquaintance with local self-government as it exists in Great Britain. Under the sympathetic guidance of Lord Pentland, I anticipate substantial advancement in the system of local self-government prevailing in this presidency.

Rev. Gardiner on the Vernaculars.

Rev. A. F. Gardiner in the course of his convocation address to the Madras University made the following observations in advocating the development of vernaculars.—

In harmony with his Imperial Majesty's express desire to conserve the ancient learning of this land, the claims of the languages and literatures of South India, *native and naturalised*, have received the foremost consideration by the University of Madras. The claims of other departments of research in closer touch with the professional and industrial life of the community have been temporarily waived in deference to the prior claims of pure learning, but will assuredly be honoured worthy as time and circumstance permit. Though there never was (or has been) any intention on the part of the British Government that English should be generally substituted for the vernaculars—even if such a policy were remotely practicable—yet the competition of the vernaculars was hardly taken into account in deciding upon the means of higher education. But their claim on the further attention of Indian universities has always been great and cannot be ignored. 'Language is the sole channel through which we communicate our knowledge and discoveries to others and through which the knowledge and discoveries of others are communicated to us.'

If the principles of Western civilisation and the discoveries of Western thought and science (which are of universal not merely local validity) are to permeate this land, it will not be through English or Sanskrit or Arabic. The enlistment of the vernaculars is an indispensable element in national enlightenment. For while on the one hand the function of English is to unite in one enlightened body those who participate directly in the learning of the West, on the other hand, the national assimilation of that more accurate information and wider culture can be effected only by calling in the aid of the vernaculars. At present there appears to be a danger that the English language which is a bond of union among the favoured few may become a barrier of separation between them and their less fortunate fellow-countrymen.

The fascination of European culture and education exert so strong an influence—due partly to worthy, partly to unworthy motives—that there is a clear disinclination on the part of university students to select courses of study in their own language, though it would be difficult to determine how far the education of an Indian could be considered in any sense complete without an adequate acquaintance with one or other of the languages and literatures which have sprung up in his native land or have become acclimatised to it. 'The influence of those literatures is largely due to the fact that it is good and beautiful in Indian life and the preservation of such influence and of its sources should accompany the infusion of the elevating and inspiring elements of Western culture. Otherwise there would appear to be a real danger that by forfeit the most precious portion of their glorious heritage.

The history of university education in India, during the past half century is a record of rapid advancement along

a view of his powers and duties" in protecting Indian labourers; and this is the "Protector" who has got me *protected* with detectives during my last sojourn in India, compared me to Mr. Keir Hardie as an evil-doer (in giving evidence on oath before the Supreme Court of Mauritius) and volunteered reports against me to the Transvaal Government and other places, where I go.

The Education Test in South Africa.

In a letter to the organ of the Indian community in Natal, Mr. Polak throws fresh light on the manner in which Indians are sought to be excluded from South Africa. In the vessel in which he journeyed back from India to South Africa were three Indians who desired to enter Natal on an education test, two of whom were alumni of the Baroda college who had passed the Matriculation examination of the Bombay University, and the third a telegraph operator on one of the Indian Railways. All the three could speak and write English. Mr. Polak himself examined them and satisfied himself that they could stand the test. Perhaps they spoke better and more decent English than some of the South African politicians and members of the Union Parliament, and yet, after subjecting them to the usual indignities of which the tale is long, their applications were rejected on the ground that they failed to satisfy the educational minister of their educational qualifications; and they were hurried aboard without even giving them an opportunity to make further representations. Verily, as Mr. Polak says, the Government have broken faith with the Indian Community and the Imperial Government. The education test, it is clear, is only a pretext. If Mr. Gokhale were not a distinguished Indian, why, even with all his educational qualifications, he too would surely have been rejected as an undesirable alien. Let us not, therefore, hug the delusion that the education test means fair-play.—*Indian Opinion*.

Indian Labour in Argentina.

Mr. M. A. Farias in an interesting note to us remarks that there is a fair field for Indian Agricultural enterprises in the Argentine Republic. The following information will, we hope, be received with interest in India. Mr. Farias writes:—

The Argentine Republic possesses a large area of fiscal lands, as they are called, which, according to the law, may be disposed of:

1. For the establishment of agricultural centres or colonies:

2. For the establishment of cattle raising colonies:

3. For sale by public tender:

4. For letting or leasing.

The area available under these heads is, roughly, 320,000 square miles

The sale of public lands is governed by the Land Law (*Ley de Tierras*).

Public land can be obtained as follows:

GRATUITOUSLY.

1. For colonization.

2. For first colonists of each section, measured for colonization, a lot of 247 acres.

3. To the Indians on the reserves.

4. To squatters of 30 years' residence.

5. To renters, in case of rescission of contract, for colonization purpose 247 acres in the site of their residence.

6. To inhabitants of pastoral colonies.

7. In accordance with the law No. 1628, September 5th 1885, for those who were in the Rio-Negro expedition.

BY SALE.

8. In national colonies in accordance with the law of immigration and colonization, and the law of public lands, &c., &c.

9. By authorization of Bonds of Public Lands Loan issued in accordance with the law of October 5th 1878.

10. To occupiers of fiscal lands for 30 years previous to the law of 1882.

11. To renters in the same case and in accordance with the same law up to 741 acres.

12. To renters in the same case.

13. To renters and occupiers of fiscal lands in the territories of Chubut and Santa Cruz in public auction.

14 & 15. In accordance with the general Immigration and Colonization, and Land Laws,

H. H. THE MAHARAJA OF BIKANER.

FEUDATORY INDIA.

The Bikaner Jubilee.

It is now twenty-five years since the present Maharaja of Bikaner succeeded to the *gadi* on the death of his brother and the celebration of his silver Jubilee during the closing week of last month has legitimately caused great rejoicing and enthusiasm in the State. He was invested with ruling powers at the age of eighteen and since December 1898 the history of the State administration has been one of continual progress and solid achievement. During the eleven years of the Maharaja's minority, the Council of Regency, with the Political Agent as President, conducted the machinery of Government.

This system together with the changes wrought in the succeeding years become the basis of the People's Representative Assembly, the members of which should be partly *ex-officio* and nominated and partly chosen by a limited electorate. The establishment of this assembly was fittingly announced on the 25th of September last, the day on which the Maharaja completed the twentieth year of his rule. Of course there were other boons besides, but they dwindle before this grant in size and importance. The Viceregal visit to Bikaner during the jubilee celebration enhanced the interest of the occasion. The personal interest of H. E. the Viceroy and the statesmanlike utterance with which he closed the day at the Durbar banquet have immensely endeared him to the Bikaner House. Lord Hardinge concluded by referring to the young Maharaja's words in 1896 when Lord Elgin visited the State, viz., "What I shall look to is this, that a successor of your Excellency may at some future date honour me with a visit, and if he should then express approval of what I have been doing, I shall indeed be happy." Those words, said H. E., have been amply fulfilled,

The Baroda Legislative Council.

The recent Session of the Baroda Legislative Council was remarkable in several ways. In the course of his opening address H. H. the Gaekwar said :—

I have not come with any idea of making a speech, and I am speaking only on the spur of the moment. Institutions like these are not new things of to-day but they have flourished even in ancient times in India. They denoted the confidence reposed by the Kings in their subjects and to my mind their effect was certain.

The present form of our institutions is adopted from a European standard, but I would not digress on that point or speak at length on the character and growth of representative assemblies.

My advice to you is that you should not consider yourselves as representing any separate or conflicting interest or a separate party, but represent only truth as embracing every party and look upon yourself as brothers and representatives of one and the same community. No party spirit should be allowed to prevail in the consideration of questions of public interest. There are occasions of temptations to stand up for, or oppose public questions from a sectarian or communal point of view. In such cases you should be guided by moderation, love of truth and fellow-feeling. To give more or less rights, depends on the various questions social, intellectual and political. When rights are conferred on a people and they do not understand their responsibility, the result is simply ruinous, but if they recognise their responsibilities and faithfully discharge them, much social good is brought about in consequence. I have started these institutions and I wish that they should progress. They are not only for your own welfare, but they are also a source of strength to the State. As long as you intelligently carry out their object, success is bound to attend your labour. As to rights, if you show yourselves more worthy, time will come to give you more.

The New Dewan of Mysore.

MR. M. VISVESVARAYA, C. I. E.

Dewan Visvesvaraya, C. I. E., is probably the first head of a technical department who has been called upon to administer the affairs of the State; and this welcome departure from a time honoured custom is greatly appreciated in Mysore. The Dewanship, with which he has been invested on the retirement of Dewan T. Ananda Rao, C. I. E., from his exalted office, has been considered a fitting sequel to his admirable antecedents—his brilliant college and official career, his original work in the field of irrigation and sanitation, his wide knowledge of men and affairs, his extensive travels in foreign countries and, above all, his many sided activities during the last three years in Mysore.

The new Dewan is thus a man well equipped with all the capacities requisite for the proper discharge of his high office. He can look back on close upon quarter of a century of official work successfully accomplished. The following speech is significant and statesmanlike—

In all the Addresses you have been pleased to read to me, you state what, in your opinion, His Highness's Government should do or what I should do, but there is not one word said of what you yourselves are going to do, not one word even of offer of co-operation on your part. I can make no promise or response on such terms. If the public ask me what His Highness's Government are going to accomplish during my term of office, I will only say it will depend on what the people themselves may help to build up. Government will be what the people make it, they cannot be much in advance of the capacity of the people. I attach great importance to the co-operation of the leaders of the public, each in his legitimate sphere of activity. We have able officers, both European and Indian, in the service of the State, to help us, and if the people also give evidence of a disposition to move, to awaken from the lethargy of years and show evidences of capacity to undertake reforms and improvements, Government will be prepared to guide and direct their activities into healthy and profitable channels.

The Ex-Dewan of Mysore.

A *Mysore Gazette Extraordinary*, published simultaneously at the capital and Bangalore on the 16th ultimo, published the following appreciation of the retiring Dewan—

His Highness the Maharaja desires to place on record his high appreciation of Mr. Ananda Row's eminent services to the State during his long service of nearly 40 years. Mr. Ananda Row has always set a very high example of zeal and devotion to duty. His deep culture, his open mind, his strict impartiality and sense of justice, and above all his unswerving personal loyalty to the ruler of his State are qualities which have earned him the regard and esteem not only of His Highness the Maharaja, but of all classes of His Highness's subjects.

"The British Government have marked their appreciation of Mr. Ananda Row's public services by conferring on him a Companionship of the Most Eminent Order of the Indian Empire, and His Highness the Maharaja has emphasized this recognition by bestowing on him the title of Pradhana Siromani, and by decorating him with the jewel of the First Class of the Gandaberunda Order.

"His Highness is now graciously pleased to sanction the grant to Mr. Ananda Row, of the full salary of his appointment for three months from the date of his retirement in lieu of the privilege leave to which he is entitled; and as a mark of his personal favour His Highness is pleased to grant to Mr. Ananda Row, a special pension of Rs. 1,250 per mensem, with effect from the 10th February 1913. His Highness is also pleased to continue the existing guard of infantry at Mr. Ananda Row's residence, and to allow him a permanent establishment of two harikars, one jamedar, one daffadar, and six dalyats. The senior surgeon will also be requested to arrange in consultation with Mr. Ananda Row to depute a medical officer to attend on him daily at his residence.

MR. M. VISVESVARAYA, C.I.E.,
The New Deewan of Mysore.

MR. T. ANANDA RAO, C.I.E.,
The Ex-Deewan of Mysore.

Education in Bhopal.

Their Excellencies Lord and Lady Hardinge paid a visit to the State of Bhopal on the 11th of this month. During the occasion a new library, a hospital and a military school were opened. The Viceroy spoke at length on the loyalty and fidelity of the Bhopal House to the British crown. His Excellency paid a tribute to Her Highness' educational efforts:—

Your Highness has devoted to the good of your State and people, the results of the wide knowledge, acquired in England and in travel in many countries of Europe and Asia, to the extent of which the interesting book which your Highness has recently published is speaking testimony. I need not recapitulate the steps that have been taken in recent years to improve the administration, but I must mention two matters of special importance in which your Highness has set a brilliant example. I refer to the measures you have taken for the improvement of the lot of women and the interest you have taken in the important question of the higher education of chiefs and nobles. It seems sometimes almost to be forgotten that women are the mothers of men, so little has been done for them in some parts of India. The frightful infant mortality that prevails in the land and the lack of education among women of all classes are matters of universal knowledge on which I need not expatiate. The difficulties that lie in the way of improvement are immense, but your Highness as a woman, who is also a ruler, has opportunities which perhaps are given to no one else. That your Highness has made splendid use of them is shown by the work done in the Lady Lansdowne Hospital, in the Madrasa-i-Sultani, and the Victoria Girls' School. Your Highness' pamphlet on the subject of the education of the rulers and nobility of India shows that Your Highness has given deep consideration to this important subject.

The Ex-Dewan of Cochin.

The following notification appears in a recent issue of the *Cochin Government Gazette*:—

M. R. Ry., K. Narayana Marar, Averal, B. A. & B. L., is permitted to retire from service with effect from the date he was relieved of his duties as acting Diwan.

2. Mr. Marar's services covering a period of nearly 23 years was distinguished and honourable. As a Puisne Judge and latterly as head of the Land Revenue Department, Mr. Marar has always in the discharge of his duties, displayed conspicuous ability. His official career rightly culminated in his appointment to the highest executive office of the State.

3. The Darbar now avail themselves of this opportunity of recording their high appreciation of the valuable services in various capacities which have been rendered to the State by Mr. Marar during his long and distinguished official career.

Sir John Malcolm and Native States.

The following circular letter, over the signature of Kesri Singh, Thakur of Piploda, has been issued: "The attention of the States and Estates in Central India is most respectfully invited to the following proposal on the auspicious occasion of His Most Gracious Majesty the King-Emperor's visit to India. It is to Sir John Malcolm as the author of treaties entered into by the States with the Government of this country that they owe their present status and powers. It is, therefore, a matter of great astonishment and regret that there is no memorial of any kind in this country to such a liberal-minded and just officer as Sir John Malcolm. A proposal is, therefore, hereby placed before States and Estates in Central India that a memorial should be set up to keep his name fresh in the minds of the rising generation of the States and Estates concerned. The nature of the memorial will, of course, be decided by the donors themselves.

INDUSTRIAL AND COMMERCIAL SECTION.

The Indian Cotton Excise.

In an article on "Indian Cotton Excise" in the November number of the *Empire Review* Mr. S. M. Johnson, Vice-President of the Upper India Chamber of Commerce, strongly protests against the maintenance of the so called "countervailing" excise levied by the Indian Government upon cotton goods produced in India. Mr. Johnson states the case for India and especially for the Indian cotton manufacturer and pleads for an organised effort in the direction. At the eighth Congress of Chambers of Commerce held in the Guildhall of London, he moved the following resolution, calling attention to the hardship of the excise; but the point was not properly considered in that assembly.

Whereas the duty of 3½ per cent. *ad valorem* levied on cotton goods imported into India is in no sense protective and is levied solely for revenue purposes, and whereas the class of cotton goods manufactured by Indian weaving mills does not compete in any material degree with imported fabrics, this Congress is of opinion that the excise duty imposed on cotton cloth produced by Indian power-looms is inequitable and should be abolished.

The writer maintains his position still and appeals to a wider public to take up the cause in the interest of India.

He says that the duties are unjust on three grounds, first because they single out one industry for taxation, while other industries are exempt, secondly because they cannot be passed on to the consumer owing to the competition of the hand-loom product; and lastly because they cannot be imposed on the sister and larger industry of hand-loom weaving. The last is perhaps the most important. Everywhere, in the long run, the hand-loom has given way to modern methods of science. What is the case in India?

During 1909-1910 the supplies of cotton cloths to India were—Indian power-loom, 215,000 (000) lb in weight, Indian handloom, 417,000 (000), imported from abroad (approximately), 400,000 (000) lb. If there is to

be progress in India's industrial development she should aim at supplying her own needs to the very fullest extent, and, as the hand-loom must gradually but inevitably give place to the power-loom, it is clear that her only hope lies in the development of her own power-loom industry. But the power loom is weighted with an excise duty, and as the duty cannot be passed on to the consumer, it becomes a tax on the capital invested in power-loom mills. I know of factories in India on the subscribed capital of which the excise duty is equivalent to a dividend of from 2 to 3 per cent. And in recent years the effects of Far Eastern competition of dear cotton, and of periods of unprofitable working, added to the excise duty, have been so serious that they have combined to curtail the investment of capital in cotton factories.

There are indeed other and minor grievances. What the writer contends for is the absolute removal of the excise duties on Indian power-looms. These clothes do not compete with imported goods; therefore the duties do not countervail, but hamper and restrict the industrial development of the Indian Empire.

The "Wealth of India."

We are glad to learn that from January 1913, the *Wealth of India* published by Messrs. G. A. Vaidyaraman & Co., Madras will be enlarged from 32 to 72 pages and the subscription raised from Rs. 3 to 5 per annum. Existing subscribers will receive the January issue. In the absence of advice to the contrary, it will be presumed that they elect to continue as subscribers at the enhanced rate and V. Ps will be made out accordingly to recover the subscription in due course.

The object of this Journal is to publish the views of experts on the various problems bearing on material progress, specially agriculture, commerce, industry, economics, co operation, banking, insurance, popular, scientific and technical education, to digest the notable articles appearing in the leading magazines and periodicals and generally to serve as a record of practical information, and useful discussions. It is believed such a publication is indispensable to statesmen, publicists, businessmen, students of economics and all others interested in the material and moral advancement of the country.

Technical Education and Labour.

The report on the Enquiry to bring technical institutions into closer touch and more practical relations with the employers of labour in India, by Lieut-Col. E. H. de V. Atkinson, R. E., and Mr. T. S. Dawson has been published.

The following general recommendations are based on the enquiry:—

The existing system of training for the Civil Engineering profession in central colleges is the most suitable one for the requirements of India.

Apprenticeship for one year on practical work in the Public Works Department should be granted, if possible, to every student passing out of a Civil Engineering College.

There is practically no opening at present for the employment of high grade mechanical or electrical engineers whose education is mostly of theoretical character.

There is a very large opening for the employment of men in mechanical and electrical engineering, who after training in a properly equipped Institute, are willing to gain their practical experience by apprenticeship on a living wage, work with their hands, and observe factory hours and rules. This employment is open to Indians of every caste or creed, grade of social position or education, provided these conditions are observed; and the height to which they can rise depends on their individual characteristics.

The best method of training men in mechanical and electrical engineering to meet the existing demand is by a course at a well equipped institute followed by an apprenticeship in works. Institutes should not grant any certificates till this apprenticeship is satisfactorily completed.

The education given in the Institute should be essentially practical: be capable of being applied commercially, and not of such a high scientific character as is often considered necessary in the West.

Large mechanical and electrical institutes are, at present, only necessary in those provinces in which industrial development is well-advanced. Minor Institutes should be properly endowed, equipped with adequate staff and apparatus, and placed under proper control as regards their courses and certificates.

The staff of all Institutes should be carefully selected, and consist of men with the necessary theoretical attainments and extensive practical experience. To keep in touch with the various industries, the staff should be permitted to take up consulting and advisory work as opportunity offers.

The scheme recommended for technical education for the mining industry is detailed.

Arrangements should be made for the permanent co-ordination of the relations between institutions and employers of labour by the appointment of a controlling officer, and the establishment of an employment bureau.

A New System of Transport.

A new system for the transportation of timber, stone, and other heavy articles was recently demonstrated in London. In this system the track is constructed with a 19½-lb. rail mounted on timber placed longitudinally and supported on vertical posts at a height of 5 ft. 6 in. above the ground. The truck consists of a light steel framework, about 15 ft. long, carried on four wheels, of which two are placed at each end one behind the other, each pair being fitted in a bogie frame. From cross-arms on the truck are suspended two cradles one on each side of the track, reaching to within a few inches of the ground, on which the loads are placed. For breaking purposes the weight of the load, or such part of it as may be necessary, is thrown upon brake blocks placed immediately above the rail and between the pairs of wheels, and in applying the brakes the framework of the cradle containing the brake blocks is lowered to and raised above the rail by means of a small winch operating a lever pivoted on the bogies.

India's Iron Industry.

Mr Ratan J. Tata presided at the annual meeting of the shareholders of the Tata Iron and Steel Company. In the course of his speech moving the adoption of the report, the chairman said —

"The most cheering fact about our steel is that its quality has been widely appreciated, and that there appears no difficulty ahead about its sale on the basis of its rank as good British steel. The rolling mills were started as soon as there was a sufficient accumulation of our own steel, and they have continued to roll whenever there has been steel. The bar mill has been in operation only four or five weeks, as it commenced operations on October 24th, 1912. Steel shapes are not the only products of the Company appreciated by customers. Our steel iron has obtained a world-wide market, orders for over a hundred thousand tons have been booked and still they are coming in. Our largest, if also most unexpected market has been Japan, and in Japan the largest customers are the Government works to whom our Company obtained introduction through our good agents and friends Messrs. Mitsui Bussan Kaisha. Every grade of our foundry pig and our basic pig alike is esteemed by some classes of customers as a speciality for their own wants, spontaneous testimonials in appreciation have been forthcoming; but the best testimony is the continuous stream of orders and repeated orders.

"For myself, I look for great things from the steel company. Among other things, I look for an early expansion. The markets opening out before our eyes even though they be the markets in a season of world-wide industrial boom, almost imperatively compel such an outlook. A few preliminary problems will have to be worked out before such an expansion can be securely faced, but they will be worked out." [The report was then adopted. A Dividend at the rate of 6 p. c. per annum on the preference shares was declared.]

A New System of Coal Mining.

A new system of coal mining now being introduced is primarily designed to cut the entire seam of coal into a granular state suitable for coking, and also to facilitate transportation, as granular or powdered coal can be pumped through pipes with the aid of water at far less cost than it can be transported by rail. At the present time 100,000,000 tons of coal are coked each year in the United States, and it is towards this material that the inventors have directed their attention. The machine is of the milling type, and in addition to cutting the coal from floor to roof into a finely powdered state it also pumps a mixture of the finely divided fuel and mine water to a distant washery, or to storage bins located near the coke ovens. This method renders unnecessary the use of explosives, and it also disposes of the coal dust. For these reasons it is claimed to be particularly safe for use in gassy mines. The machine itself is automatic, and advances along the floor by a simple hydraulic feed mechanism. Rotary cutters on the armature shaft of the driving motor are fed into the face of the seam, and they cut the coal in much the same way as wood is cut by a circular saw. In addition to its forward movement the motor is given a swinging side motion through a limited angle so that the proper width may be cut. A fire hose throws a powerful stream of water against the face of the coal while it is being cut, thus eliminating the dust and keeping the tools cool, while the water carries off the product to the nearest sump, from which it is pumped to any desired destination — *Indian Trade Journal*.

A New Syrup from Potato-Starch.

According to a German paper a starch and Potato drying corporation has placed a new syrup upon the market which is obtained from the potato starch, and is to be used for preserving fruit of all kinds. It is excellent for table purposes — *Indian Trade Journal*.

AGRICULTURAL SECTION.

The Needs of Plants.

The *Annales de l'Institut Pasteur* for October 1911 contains a paper in which it is suggested that scientific progress in agriculture is receiving interference, not so much on the account of the want of ideas but because of the lack of experimental methods suitable for their verification. Great stress is laid on the suggested necessity of cultivating the higher plants in nutritive solutions free from bacteria, when it is desired to gain further information concerning their physiological functions.

It is recognized that past methods of experimentation have been most valuable, but it is submitted that they require amplification in the direction indicated. The mode of procedure brought forward is to develop the plants at first in a complete nutritive solution, and then with these plants, after their roots have been well washed, to conduct investigations in incomplete nutrient solutions free from bacteria. The author calls this method the method of interrupted nutrition; he has employed it already in studying the formation of citric acid in fungi. It has also been applied to a certain extent to the study of the growth of maize.

It will be recognized that the idea is not new. The method is rendered extremely difficult because means have not been devised so far for growing plants easily in nutrient solutions that will remain free from bacteria.

Agricultural and Industrial Show.

The Sixth Kistna Agricultural and Industrial Show will be held at Ellore on the 22nd, 23rd and 24th February 1913. Exhibits are invited from all parts of India, Burmah and Ceylon. For particulars apply to the Honorary Secretary, Show Committee, Ellore, Kistna District.

West Indian Sugar-Canes in India.

The Annual Report of the Agricultural Stations in Eastern Bengal and Assam for the year ending June 30, 1911, shows that, among the sugar-canes grown at the Dacca Agricultural Station during that time there were included B. 147, B. 1753, B. 376 and B. 208. Among these it was thought that one or two, together with Striped Mauritius, would prove superior to the local cane on becoming accustomed to the changed conditions.

These canes were obtained from the Jorhat Agricultural Station, and mention is made in the report that they were under trial at the station; further, in describing their behaviour there, it is stated that they all, except B. 208, showed resistance to red rot; it was decided however to continue experimentation with this cane. As regards the total yield of sugar from the canes that were grown successfully, Striped Mauritius attained the first place, followed by B. 376 and B. 147. It is stated that a high yield with a superior quality of juice are combined in these canes. The varieties Striped Tana and Kheri also showed a high yield of cane and juice, but the inferior quality of the latter caused the yield of sugar per acre to be low. In another experiment at this station, B. 147, B. 376 and Striped Mauritius again showed a striking superiority as regards quality of juice, the sucrose content and purity being high and the glucose ratio low. B. 208 is reported as having had to be destroyed on account of disease in the previous year; it is stated however, in the experiment under discussion, to have given a juice of high quality in spite of the fact that it continued to be very susceptible to attacks by red rot. The report says:—'Two of the Barbados varieties, viz., B. 147 and B. 376, are exceedingly promising. Although not such high yielders as Striped Mauritius, they gave juices of very high quality.'—*Agricultural News*.

Sericulture in the Punjab.

An interesting account of the measures taken to revive sericulture in the Punjab is given in a *compendium* issued by the Government of that Province. The collapse of the industry in Kashmir, as well as in the Punjab, was due to epidemics among silkworms, which, on account of their complete demonstration, are peculiarly susceptible.

The Silk industry in Kashmir was revived by the importation of sound eggs from Europe, and it now gives a net return of Rs. 71 lakhs a year to the Durbar while affording employment to 9,000 spinners. Eggs have also been imported by the Punjab Government, and new plantations of suitable varieties of mulberries have been started, and if care and attention are devoted to the industry by the people who would benefit from its prosperity, good results will doubtless follow. The Government is distributing leaflets containing practical information, and its trained staff is sent on tour to hold demonstrations and to advise the rearers at frequent intervals during the rearing season.—*Indian Agriculturist*

Dried Mango.

An observer in North Queensland thus describes a method of drying mangoes that is carried out successfully in that part of Australia. The description appears in the *Queensland Agricultural Journal* for February, 1912.—

The mango is picked just before turning colour. It is then cut up with a large knife in chips or small slices some 2 inches in length 1 inch or so wide, and perhaps $\frac{1}{2}$ inch thick. These slices are laid in the sun to dry, and become dry enough to store in three or four days. Sheets of galvanized iron (roofing) are used with sheets of paper laid on them. Cloth was not found satisfactory, and the paper could not be dispensed with, as the acid juice of the fruit turned the product a dark colour if in direct contact with the iron. The fully-dried chips are of a very pale-yellow or

brownish-white colour, and if only cut into similar shapes could hardly be distinguished in appearance from the best dried apples. These chips when thoroughly dry are stored in air-tight receptacles and may be packed quite tightly in them. The best receptacles are largely earthenware jars. Hermetic sealing is very necessary, and is generally, done with ordinary beeswax.

When cooked, the dried fruit darkens in colour a little and is not so decided in flavour as is the typical fresh mango—in fact, to one who did not know what it was, it tastes somewhat like a mixture of dried apples and apricots. It makes excellent tarts and pies, and could equally well be used for jams or chutneys.

Preservation of the Cotton Crop.

Experiments are about to be made by the Egyptian Agricultural Department for the future preservation of the cotton crop from the cotton worm (*Prodenia Littoralis*) and the boll-worm (*Earias Insulana*), the two pests which have wrought such havoc in the cotton crop for many years. Steps have been taken to introduce predatory insects from abroad, by the help of which it is hoped finally to check both these pests. Among the former are the two species of *Lymanopetala* and the *Dipteron*, which have been found to destroy a large proportion of boll worms in the normal years in India, while another is a protezoan disease (*Micropodidium Polydrinus*) which attacks with great success the moth, known as "Nonne," which is so destructive to pine forests in North Germany. This parasite has already attacked the boll-worm in Egypt with marked effect, and its further propagation by the introduction of its German brother in the country will, it is hoped, prove highly beneficial. All these experiments have a very practical interest for us in this country, where the cotton crops have so much to fear from the same or similar pests.—*Indian Agriculturist*

THE PHYSIC

Dr. Butler—Drink away, boys! The mixture is a good one as I can certify, and can never do anybody any harm!

[The boys know better.]

[The Government conditions for granting a charter for the Hindu University—particularly those relating to the name, and the affiliation of colleges—have not met with the approval of the committee. The objections to the conditions are the same as those advanced by the Moslem University Committee.]

[The Hindi Punch]

Departmental Reviews and Notes.

LITERARY.

THE GREAT UNKNOWN.

Messrs. Longmans will shortly publish a book by the late lamented Andrew Lang. Mr. Lang always scoffed at the Baconian theory of the origin of the plays, of Shakespeare and in his approaching book shows himself equally incredulous of the "Great Unknown" hypothesis.

"MANORANJAN" SPECIAL.

We have received the Special Diwali Number of the "Manoranjan." The "Manoranjan" is a first-class society magazine for the Marathi speaking people and has been doing good service to its readers during its last eighteen years' existence. The Special Diwali Number is a volume of 240 pages containing more than 100 nicely executed photo-zincographs and more than 40 contributions from the best and the most cultured of the Marathi writers and poets of the day, including eminent lady writers. Mr. K. R. Mitra, Editor and Proprietor, claims for this Magazine an average circulation of ten thousand copies per month. We congratulate the Editor on the excellence of his enterprise.

LYRIC POEMS BY R. N. TAGORE.

The India Society will publish immediately a small collection of lyric poems by Rabindra Nath Tagore, entitled "Gitanjali." The poems have been translated by the poet himself from the original Bengali into English. The book has been edited by Mr. W. B. Yeats, who has contributed an introduction, and will also contain a photogravure of a drawing of Mr. Tagore by Mr. William Rothenstein. The edition has been printed for members of the India Society, and is limited to 750 copies, but 250 copies will be offered to the general public, and may be obtained from Messrs. Hatchard's, 187, Piccadilly.

THE TIMES OF INDIA.

The Christmas number of the *Times of India* is a really fine production. It is bound in a fancy wrapper, bearing on its face a characteristic coloured print of an Indian frontier tribesman. The first full-page picture that meets the eye is a beautiful tinted reproduction of an original water-colour drawing of the Imperial Durbar at Delhi by G. P. Jacomb-Hood, M.V.O. There are upwards of 70 pages of profusely illustrated letter-press, and the whole number is well printed on art paper. Its literary matter is excellent. The price of the publication is Rs. 1.

THE PEOPLE'S BOOKS.

Messrs. Jack are sending out "The People's Books" in rapid succession. From the following list it will be seen that many interesting and novel subjects are treated:—"Geology" by Professor T. G. Bonney, F.R.S.; "Weather Science" by R. G. K. Lempfert, M.A.; "Hypnotism" by A. M. Hutchison, M.D.; "The Baby, A Mother's Book by a Mother," by a University Woman; "Motherhood, A Wife's Handbook" by H. S. Davidson, M.B., F.R.C.S.E.; "Navigation" by W. Hall, R.N., R.A.; "The Church of England" by Rev. Canon Masterman; "The Hope and Mission of the Free Churches" by Rev. Edward Shillito, M.A.; "Co operation" by Joseph Clayton; "A History of English Literature" by A. Compton-Rickett, LL.D.; "The Training of the Child" by G. Spiller, "Tennyson" by Aaron Watson.

MAHARASHTRA LITERARY CONFERENCE.

At the Maharashtra Literary Conference which was held at Akola on the 29th October 1912, Mr. Hari Narayan Apte the well-known Deccani novelist presided. He contested in his inaugural address the three charges levelled by critics against Marathi literature, namely, that it was not progressive, that it was being flooded with light literature of poor quality and that it was being undesirably influenced by the importation of foreign words, ideas and thought.

LEGAL.

HOW TO BUILD UP A LAW PRACTICE

Mr. Ditzon writes in the *Law Student's Helper* :—

"The Primary and fundamental thing is to form an acquaintance. A lawyer should get acquainted with people of every religious creed and political belief. He should be democratic in his manners, free to be a friend and adviser to any one who needs the protection or seeks the advice of an advocate. But the formation of acquaintances who are helpful and valuable is a matter which takes time. It cannot be done in a hasty manner. Of course, men are met here and there and everywhere, but in order to really form close acquaintances it is necessary to belong to organizations where intimate relations exist. In the meetings at the church, the lodge room or the club, friends are won and clients are made.

"*Business Organizations.*—A lawyer must gain the confidence of the business men of a community. They will bring better and bigger business after he has established his reputation. A commercial law practice is most desirable. Businessmen are met in the commercial clubs. There he will have the opportunity of learning about the problems which affect the community and of solving these problems. After he has become acquainted with the needs of the town or city he will probably find evils that should be corrected, or improvements that ought to be made. Thus, an opportunity may be afforded by which a lawyer can champion a cause which will benefit the community and at the same time bring him before the public eye."

Mr. Ditzon then speaks of the necessity of a good grounding in elocution and oratory and insists on the lawyer taking part in politics. Regarding his methods of practice he writes :—

"A case may look ever so hopeless, still if it is meritorious and hard work and common sense are applied to it, it can be won. If a lawyer satisfies his clients by performing hard work and charging reasonable fees a successful career will have been started. The satisfied client will advertise his lawyer's abilities; no code of ethics forbids that. He will send his friends up to that lawyer's office when they need legal advice. And so one client will tell another, as the apostles of old brought one disciple after another, and by and by a lawyer will have a clientage. Persistency, tact and industry will blaze a way to success."

INDIANS AND THE INNS OF COURT.

A grossly unfair attempt is being made by the Inns of Court authorities to prevent natives of India from qualifying for the Bar. Hitherto the regulations have been alike for all British subjects. For example, the passing of the preliminary examination for the M. A. degree at a Scottish University was formerly a sufficient ground for the acceptance of candidates for the Bar. To this have now been added the words, 'For students whose native language is English. The large numbers of Indians who have attended Scottish Universities are at once ruled out, although they have passed the same test as their British fellow-students. This is the kind of action which manufactures disloyalty in India.—*Reynolds's Newspaper*.

THE WHITE SLAVE-TRAFFIC BILL.

The European Defence Association, Calcutta, has expressed its opinion on the White Slave-Traffic Bill. The Association objects to a short title and recommends the use of a less sensational title. In its opinion legislation should primarily be directed against those who procure minor girls for immoral purposes, and that no advantage could be gained by creating special form of procedure for arrest and trial of offenders.

MEDICAL.

EVILS OF TOBACCO.

I believe that the continued use of tobacco disturbs the innervation of the heart, and thus its action becomes weak, irregular and intermittent. My mode of treatment is to inhibit the use of tobacco, and give one Cactina Pillet every one, two or four hours, as the occasion demands. This form of treatment is also applicable in the cardiac erethism produced by over indulgence in the use of such stimulants as tea, coffee or alcohol — V. W. Gayle, M. D., in the *M. S. Journal*.

THE MALARIAL CONFERENCE

The following resolutions were passed by the Malarial Conference which held its sittings in the middle of last month at the Council Chamber, Madras —

1. That after another year's experience and investigation, this conference desires to endorse and again bring to notice the resolutions passed by the last conference as noted below (1) This conference is of opinion that researches by experts in the field such as those carried by Christophers and Bently prove the value of preliminary scientific investigation and seem to point to the probability that anti mosquito measures may not prove so costly as was at one time feared. (2) The conference believes that no one measure can be suitable for all conditions that favour the prevalence of malaria, that quinine prophylaxis applied to a free population is difficult to carry out in the thorough way necessary for success and that combination of several measures may be required as local circumstances may indicate. The conference is of opinion that notwithstanding the difficulties of quinine prophylaxis, it cannot be too strongly emphasised that under the peculiar conditions of the Indian populace arrangements for treatment by quinine of those sick from malaria is a matter of primary importance from point of view of saving life, of preventing suffering and of destroying a potent source of infection. (3) The conference desires to call the attention of Government to the possibility of danger arising from burrowing pits in the proximity to human habitation, especially when such excavation would result in stagnation of water therein. (4) The conference is of opinion that the education of the people is a most important anti malarial measure and that every effort should be made to secure the co-operation of the public without which there is little hope that the campaign against malaria will ever be crowned with success. They believe that instruction in schools, as well as lecture and lantern demonstration in villages and towns, are the best methods of propaganda and that in this way information is more likely to reach the people than by the publication of Pamphlets and posters. (5) The conference, while strongly recommending the prosecution of further research is of opinion that although expert investigation is still necessary, enough is known as to the breeding habits of mosquitoes, etc., to make it frequently possible for trained workers to deal with malaria in an efficient manner.

2. That in the view of the correlation which certain observers have found to exist between density of jungle in and around villages on the one hand and the intensity of malaria on the other, it is desirable that this question should receive the careful attention of all those working at malaria in India, with a view to the collection of information for discussion at the next conference.

3. That experience in the United Provinces and elsewhere has shown that the regular administration of quinine to children in school during the malarial season is a practical measure of proved utility and of easy application and that this measure, in addition to its immediate effects on health, is likely to prove a powerful aid in the spread of knowledge regarding the uses of quinine, both in the prevention and cure of malaria.

4. That amongst the methods of combating malaria this conference desires to lay special stress on the general methods of water tidiness, such as the filling up or draining of pools in which dangerous mosquitoes may breed and the cleaning and trimming of edges of all tanks or water courses situated in the proximity of villages so as to deprive mosquito larvae of protection against their natural enemies, afforded by reeds and that in rural areas this object can best be attained by the formation of anti malarial societies on the lines of the Coronation Anti-malarial Society recently started at Jessore.

5. In view of the fact that investigation has shown that the cultivation of rice and other crops, for which an abundance of water is necessary for their growth, leads to the formation of dangerous breeding grounds of mosquitoes, it is desirable in the interest of agriculture in India definitely to ascertain the precise conditions under which such cultivation is or is not likely to be harmful.

6. That the provision of a pure and protected water-supply and any means whereby the health of a population can be improved and its power of resistance against disease increased, must be regarded as an important measure of sanitation useful alike against malaria and other diseases, both in urban and in rural areas.

7. That further research is necessary with a view to ascertain the most effective larvicides and natural enemies of the mosquito and which of them are best suited for use in particular localities, and under different conditions of environment the advisability of constructing ponds in centres where permanent water can be obtained for breeding on a large scale and the distribution of the more important of the natural enemies of the mosquito larvae.

8. That pending the completion of ategomols surveys, this conference is not in a position to express any opinion as regards the practicability of extermination of the mosquito or its reduction to non-dangerous numbers in our chief ports.

9. That further enquiries are necessary into the etiology and modes of transmission of various forms of spino-cheetal infection and of fevers of short duration such as dengue, seven day and three-day fevers, the pathogenic organisation of which appear to be closely allied to that of yellow fever.

10. That whilst continuing the examination of dogs and laboratory experiments in connection with the etiology and modes of transmission of Kala Azar a further field of investigation should be undertaken both in Madras, Bengal and Assam with a view to ascertaining what are the conditions specially favourable for the spread of the disease.

SCIENCE.

A SUSCEPTIBLE MOUNTAIN.

The discovery that the Eiffel Tower in Paris varies in height according to the temperature of the air elicits a still more remarkable piece of information of the same sort. It appears that Mount Everest, still believed to be the highest mountain in the world, varies in altitude from time to time as much as 800 feet. During the daytime the snows will often melt to that extent on the summit of the mountain between sunrise and sunset. On the other hand, often between sunset and sunrise, the mountain will regain 300 feet in a single night. Therefore the figure given in the geographies of 29,002 feet for Everest's altitude is a mere rough average. Colonel Burrard who has made a study of the subject, says that the officers of the Indian survey place the mountain somewhere between 28,700 and 29,150 feet in height, and decline to guess any closer.

INDIAN METEOROLOGY.

A notable feature of the International Meteorological Conference in London was the fact that the dinner with which it closed was presided over by the Maharaj-Raja of Jhalawar. This is probably the first occasion on which an important scientific gathering in the British metropolis has taken place under the Presidentship of an Indian prince. The Raja of Jhalwar, however, is an enthusiastic meteorologist, and, as he pointed out in his speech at the dinner, he represents a country where the science of meteorology possesses an almost unique importance. "Words cannot describe," he said, "the cares and anxieties which weigh upon our minds like dreadful nightmares at the commencement of every rainy season," and it was to meteorologists they looked for encouragement and warning by the provision of efficient forecasts. An interesting contribution to the speeches of the evening was that of Geheimrath Professor Hellman, a German delegate, who pro-

posed the "Progress of Indian Meteorology," and pointed out that all the most ancient MSS. showed that the meteorology in India had been ever a favourite subject of research. Indian meteorology, he added, had done much towards the progress of world meteorology, as the study of a large continent yielded far more valuable guidance than could possibly be derived from the observation of restricted areas.

MATHEMATICS AND ENGINEERING.

Sir W. H. White, formerly Director of Naval Construction, lectured at the International Congress of Mathematicians at Cambridge upon the place of mathematics in engineering practice. The foundations of modern engineering, he said, had been laid on mathematical and physical science, and no branch of engineering had benefited more from mathematical assistance than naval architecture. Mathematical theories led to the introduction of the experimental tank, to which the success achieved in connection with modern developments of steam navigation and the attainment of very high speeds was chiefly due. Mathematicians seeking new fields to conquer might profitably turn their attention to two subjects on which additional light was still needed. The first had relation to the laws which governed the efficiency of crew propellers when applied to steamships. They had been using screw-propellers for more than 70 years, and frankly he confessed that they were still in need of light about that. An experience of his own showed the possibilities here existing. A large cruiser attained the guaranteed speed of 23 knots on trial with about 30,000 horse power. He had anticipated a speed of 23½ knots and he got it by simply increasing the radial area of the propellers by 20 per cent. Another subject upon which knowledge was still incomplete was in regard to the stresses experienced by the structures of ships at sea, when driven through waves and made to perform rolling, pitching, and heaving movements simultaneously.

PERSONAL.

[The following selections from a contemporary will, we trust, be read with pleasure as the sketches are all of topical interest—*ED. I. R.*]

WHO'S WHO AT THE SEAT OF WAR

King Nicholas of Montenegro, who, with dramatic suddenness, opened the campaign in the Balkans, is a warrior to his fingertips. He commands his army in person, and on the battlefields has distinguished himself with splendid courage. He it was who, in 1876, after a three months' siege captured the Turkish fortresses of Nikahusch and himself received the surrender of the Turkish commandants.

Montenegro's ruler is a giant in stature, standing over 6 ft. in height, and in spite of his seventy-one years is as strong and agile as the youngest of his soldiers. He was only nineteen when he was called upon to rule Montenegro, and he has reigned longer than any of his contemporaries, except the Emperor of Austria.

Probably no monarch is more beloved by his subjects than King Nicholas of Montenegro. He is regarded as their father as well as ruler, knows most of them by name, and lives among them at Cetinje, the capital, in Spartan simplicity in a small sparsely furnished place little better than an average British villa taking the keenest interest in the humblest of pursuits.

The daughters of the King of Montenegro are famous for their beauty and marriages. His two eldest daughters, Princess Melita, Princess Stana, married Russian Grand Dukes, while his third daughter, Princess Helena, is Queen of Italy, an alliance which is not without political importance in the present crisis. It is said that a visitor once commiserated with His Majesty on the fact that his beautiful country seemed to have no export. "Sir," replied the King, "you forget my daughters."

Although a somewhat strong minded, ambitious despot—King Ferdinand of Bulgaria, the chosen chief of the Balkan League, is a man of simple tastes, and nothing delights him more than to leave Sofia and State troubles behind him and go to his beautiful summer palace at Varna, on the Black Sea and indulge on his zoological and botanical studies. He is an accomplished zoologist and spends much time classifying insects and plants. He has catalogued nearly all the flora and fauna of Bulgaria, and in Sofia has established a zoological garden at his own expense.

Lake Montenegro's ruler, King Peter of Serbia is an experienced practical soldier, for he fought with the French through the Franco-German War. He has now occupied the throne of Serbia for nine years, and they have been nine years, to quote his own words, of "work, worry, and fear of assassination." For it is a recognized fact that he is but the tool in the hands of the regicide party which murdered King Alexander and Queen Draga in 1903.

Before his accession to the Servian throne, King Peter lived in exile in Paris in a flat for which he paid the very modest rent of £30 per annum. He was in those days a great athlete and boxer.

Perhaps the most remarkable fact concerning the Sultan of Turkey, Mehmed V., is that for thirty-three years, during the reign of Abdul Hamid, he was a prisoner of State, being permitted intercourse with a few servants and dependants only. No one dared salute him, and it was risking death to exchange a word with one of his servants. A few years before the long imprisonment ended, a number of cadets were sent into exile because one of them had given a light for his cigarette to a man sitting near them on a tramcar. The man it turned out was a member of military suite of the imprisoned heir apparent.

GENERAL.

RAJPUT PAINTINGS AT THE ALBERT MUSEUM.

In the Indian Section of the Victoria and Albert Museum, London, there is now to be seen a very interesting collection of paintings and drawings, lent by H. H. the Gaekwar of Baroda from the Baroda State Museum. Most of these are Rajput illuminated tempera paintings of the late seventeenth, eighteenth, and nineteenth centuries, and in their general principles of design they bear a strong resemblance to the later European illumination. But though they also show strong Persian, and some Moghul, influence, they are in the main characteristically Indian, both in their merits and in their defects. Many are evidently executed after traditional designs. The collection will be exhibited for a period of three months.

THE TWELVE BIGGEST BRAINS IN THE WORLD.

In point of brain weight, the following in the order named are the twelve leading names, the weights being indicated in grammes: Ivan Tourgenieff, Russian novelist, 2,102; Joseph Bonny, French jurist, 1,935; George Cuvier, Franco-German naturalist, 1,830; E. H. Knight, American mechanician, 1,814; Franz X. Kraus, German theologian, 1,800; John Abercrombie, Scottish physician, 1,786; Benjamin F. Butler, American statesman, 1,758; Edward Olney, American mathematician, 1,701; Herman Levi, German composer, 1,690; A. Winchell, American geologist, 1,666; William M. Thackeray, English novelist, 1,658; Rudolf Lenz, German composer, 1,636 — *Science Siftings*.

A DREAD PROPHECY.

"Europe will have disappeared by the year 1972." This is the dread prophecy uttered by Mr. Albert Noble, Professor of Seismic Science at the Philadelphia University. Volcanic upheavals of terrific force will, he says, bring about the end. "During the past two centuries," declares this new Jeremiah, "the forces of Nature have been preparing for this cataclysm, of which many children now

living will be the witnesses or victims. "The earth's crust will finally burst and the ocean will invade and take the place of the European continent. The Gulf Stream," he concludes, "will then be deflected from its course and will solely continue to wash the eastern coast of America, a region which will be transformed into a terrestrial paradise." Will it now? It will want a new system of government first.

TOWARDS AN IMPERIAL FOREIGN POLICY.

Writing in the November issue of *The Fortnightly Review* Mr. Sydney Low says that the English policy was often swayed by personal influences, often turned by popular emotion, often affected by vague suspicion. They are neither so good nor so bad as they have been painted.

Whatever may be the future destinies of the Balkan regions and the precise relations of Turks and Bulgarians, Serbs and Greeks, Austrians and Russians, the interests of Great Britain and the British Empire are not closely affected; and we can even survey without a shudder the future of Constantinople. As a matter of fact the European Balance of Power is in no particular danger. We have five great powers, all of them with large populations equipped in full panoply of war and if one is somewhat superior to the others its superiority is not sufficient to cause any apprehension of general subjection. Mr. Low concludes:—

"Our duty lies elsewhere. We must have allies, it is true, but the allies should be those of our own Empire. Our policy and our strategy should alike be directed to the maintenance and protection of our Empire and trade. We might have an Imperial Committee of Foreign Affairs constituted on the model of the Imperial Committee of Defence which should be the main apparatus for Imperial co-ordination. The external policy of the Empire should be decided after a process of consultation and discussion in which the representatives of all the self-governing nations should take part.
